AUGER BIT ESSENTIALS

The Third Reason why the well-known

RUSSELL JENNINGS BITS

are so extensively used is that they have clean-cut, properly shaped

SCREW POINTS

which lead the bit into the wood without forcing.

Our *double-thread* screw point is the standard for accurate work in soft or seasoned wood and in any wood not extremely gummy or hard.

Our *single-thread* screw point is for quick boring. The deep threads take a strong hold on gummy and hard woods. It does not clog in gummy wood and leads the bit into extremely hard woods, such as ironwood and lignum-vitae. It is suitable for end boring.

Occupation .....

A Shearing Cut Gets Best Results in Floor Scraping

Why does a mechanic when scraping a floor by hand use the Shearing Cut? Because he obtains smoothest and quickest work so. When you whittle a piece of wood you use a Shearing Cut.

A Shearing Cut is ALWAYS made with the

"DAISY" FLOOR SCRAPER

With One Ten-Inch Blade Single Shearing Cut is Made
With Two Five-Inch Blades Double Shearing Cut is Made

The "Daisy"

CUTS EITHER WITH OR ACROSS THE GRAIN
CUTS RIGHT UP TO BASE BOARD AND INTO EVERY CORNER
IS EASIER ON THE OPERATOR AS IT REQUIRES ONLY A SLIGHT LIFT TO GET BEST WORK
WILL DO MORE WORK THAN ANY OTHER IN SAME LENGTH OF TIME
WILL DO PERFECT STRAIGHT EDGED WORK AND WILL PLEASE YOU
CLAMPS ARE INSTANTLY FASTENED
FILING DEVICE FILES BLADES TO RIGHT BEVEL
EDGE-TURNING DEVICE IS A WONDER

We Want A Builder In Every Town

We Have an Attractive Proposition for One Carpenter or Builder in Every Community to Take Orders for Our Widely Advertised

EDWARDS' METAL SPANISH TILE

ARE EASILY SOLD BY OUR AGENTS

Home Owners Everywhere Are Reading Our Advertisements in the Leading Magazines

EDWARDS' INTERLOCKING METAL SPANISH TILE

ARCHITECTS EVERYWHERE SPECIFY THIS ATTRACTIVE ROOFING

Edwards' Metal Spanish Tile are stamped out of the highest quality Worcester Grade Terne Plate, size 10 x 14 inches, furnished either painted or heavily galvanized. They are provided with our patented interlocking device, which conceals all nails, makes it possible to get a perfectly moisture proof roof without **soldering** and without danger of having the tile crack open in extreme cold or hot weather.
Edwards' Metal Spanish Tile looks exactly like the best Terra Cotta Tile. They have the decided advantage of being much lighter, easier to apply, longer lived and cost much less.

Write us today about your territory. Here's an opportunity you should not miss. Many carpenters and builders have been so successful taking orders and laying our Metal Spanish Tile that they now devote their entire time to this business. Others have made big profits selling and laying our metal tile roofing "between jobs." We show you how to build up an independent, profitable business in your own community. Write for our proposition today. The territory is going fast. Don't be too late. Send a postal right now.

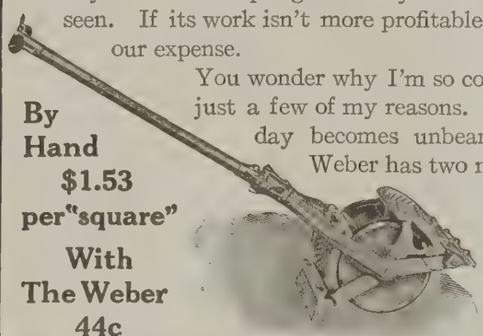
8,000,000 ft. of Hard Wood Flooring



On 3740 ft. you can Save the price of a WEBER

That's approximately what was finished with a Weber the past year—and at a saving of $91,076.88 over hand work. It cost about 1 7-13 cents to hand-finish a single foot. A Weber does the same work for close to 2-5 of a cent. That means about $1.53 a "square" by hand against 44 cents with a Weber. Here's a vital array of money-saving information. Can you beat it? Can you afford to put in another year scraping by hand or with some poor, flimsy scraper? Start 1911 right. Send for

FREE TRIAL **The WEBER DOUBLE ACTING Floor Scraper** **5 to 10 DAYS**

the Weber on trial. Test it out to a "dead certainty" for 5 to 10 days. Put it up against any floor scraper you've ever seen. If its work isn't more profitable to you, return it at our expense.

By Hand $1.53 per "square" With The Weber 44c

You wonder why I'm so confident. I'll tell you just a few of my reasons. To pull a machine all day becomes unbearably tiresome. The Weber has two movements—forward and backward—which relieves you of that monotonous "all day" backward movement. Not only that, but you can smooth up uneven joints and remove dark stains easily and quickly because you can see exactly what you are doing, while it enables you to scrape clean across the centers of very narrow rooms.

Other Weber features are a Flexible Frame—which is **guaranteed to prevent chattering and waves**—Handle and Blade Adjustment—Sander—and Shearing Cut and Bowling Alley Attachments.

Write for Information

about a scraper that has every improvement it should have for perfect work on all kinds of wood floors.

WATSON H. BARBER
Contractor

Installing of Cabinet and Joiner Work Specialties

Waukegan, Illinois, May 26th, 1910,

Triple "A" Machine Co., Chicago, Ill.

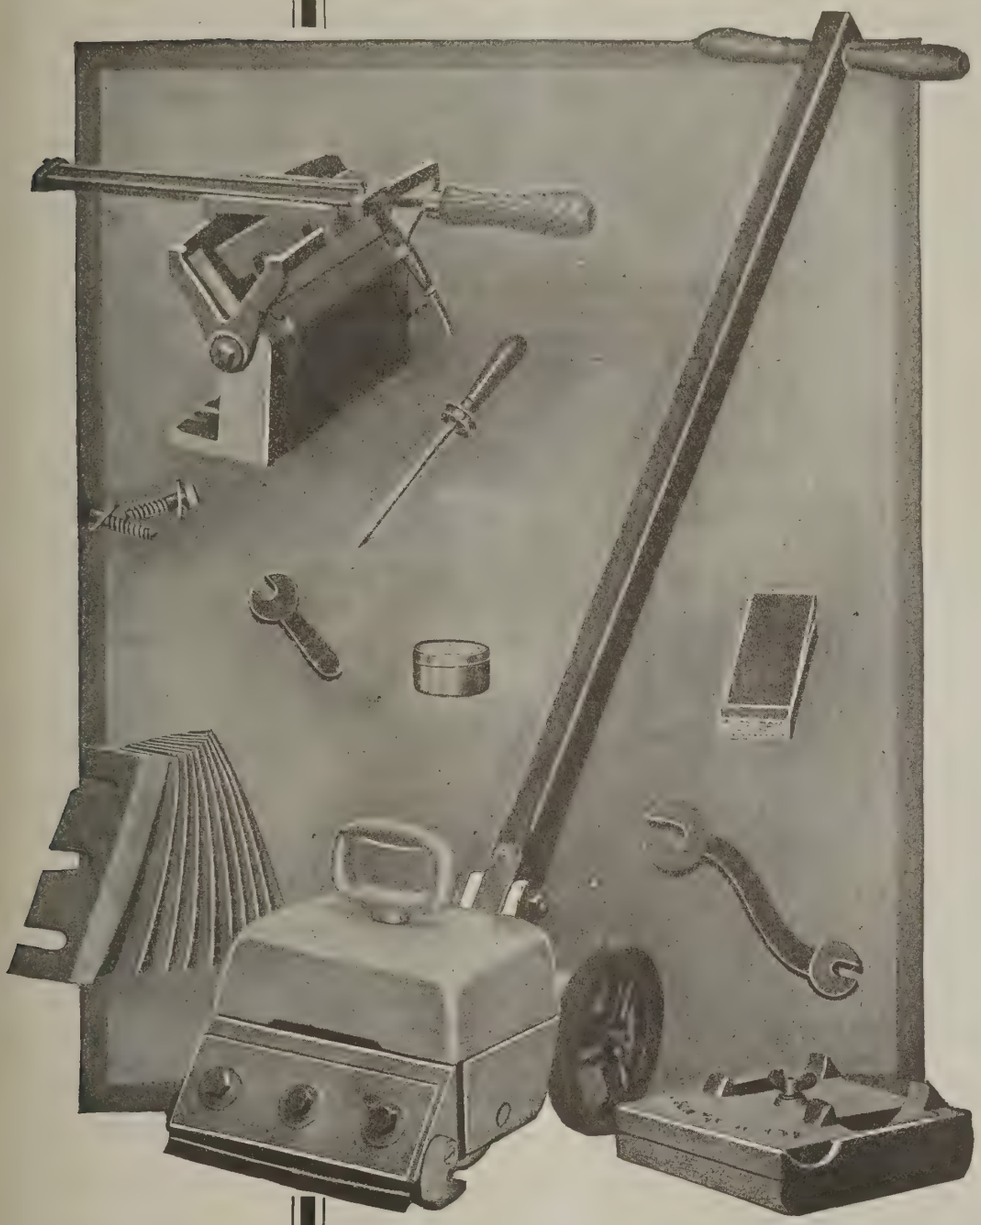
Gentlemen:—I herein express to you my appreciation for the work and capability of your Triple "A" Floor Surfacing Machine, both as to quantity and quality of the work your machine is capable of doing, as I think I have given the machine a hard test as I had about 2000 squares of oak and maple flooring to dress at the U. S. Naval Training Station, North Chicago, Illinois. This flooring was laid about 4 months before cleaning and was full of grit and dirt from being walked and worked over. This floor had to be dressed so as to pass Government inspection. I had tried different electrical sand paper machines without satisfaction and will say that the Triple "A" Machine is the only one that met the requirements. I would not hesitate to recommend the Triple "A" Machine to any and all that would desire a Floor Surfacing Machine that would do both quantity and quality work.

Yours very truly,

WATSON H. BARBER.

Triple "A" Floor Smoothers in operation at Drill Hall, U. S. N. T. S.

THE TRIPLE "A" SPRING-DRIVEN FLOOR SMOOTHER STOOD THE TEST (where others failed) on 200,000 square feet of oak and maple floors of the U. S. Naval Training Station.



Bear in mind that the *Triple "A" Spring Driven Floor Smoother* is practically a *power machine.*

Write for circular describing this up-to-date. *Floor Smoother* and *Automatic Sandpapering Attachment.*

Look This Over Carefully

Does this equipment look as though it is simply made to sell or has it the appearance of being constructed to do the work for which it is intended—Floor Scraping?

You can find out very easily and it won't cost you one cent. Just write me that you are ready to do some floor scraping and I will ship the **Acme Floor Scraping Outfit** to you on **One Week's Free Trial.** If, after you have given the machines a thorough test, you do not find the same entirely satisfactory, pack them up and ship them back at my expense.

I have been making this **Absolutely Free Trial** proposition for the past three years and thousands of contractors have investigated into it. If you haven't —why not? You certainly want to save 75% of your floor scraping labor expense, don't you? The **Acme Floor Scraping Outfit** offers the means for you to accomplish this saving.

Bear in mind that I devote my entire time to manufacturing floor scrapers. It is not a side issue with me. I superintend the construction of each **Acme Outfit** and can therefore guarantee it in every particular. You take no chances—I assume all responsibility.

I want to send you booklet and full details of my free trial offer. Write me for them to-day.

NAT BUILDER

"SAWTOOTH" Roller Marking and Mortise Gauges

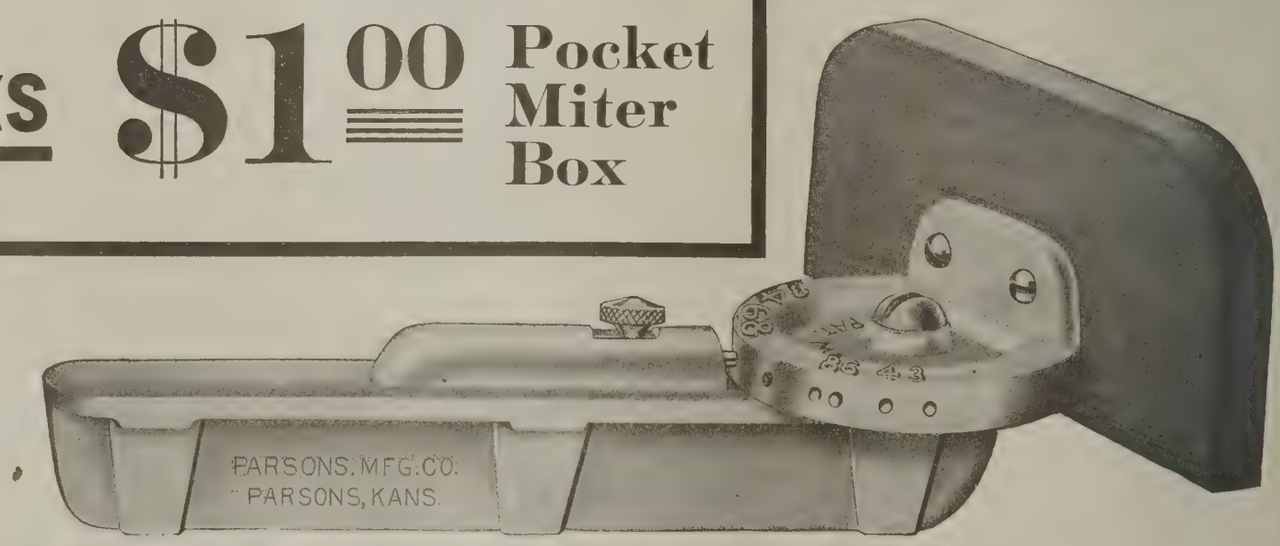
By making this Gauge with a Sawtooth wheel at end of bar in place of a pin or straight roll we have a gauge which will not run out with the grain of wood. The Sawtooth wheel runs true with edge of board, regardless of knots or cross grain wood.

Both Rods are graduated, and very near the end of the outside rod there is placed a steel pointed pin to admit of its being used close up into a rabbet or corner. This Gauge is strongly made.

This is the only Gauge on the market that will mark true at all times.
Another feature is, the line made by a pin gauge is very hard to see on some kinds of wood, but with our Sawtooth Roller Gauge the marks made are like punch marks, and reflect the light from all sides.

Our Single Gauge No. 10 is like No. 17 without the inner rod. Furnished in Nickel Plated and White Metal Finish.

LIGHT, NEAT AND COMPACT.



No. 17 Nickel Plated . . . . $1.00 No. 17 White Metal Finish . $0.75 No. 10 Nickel Plated. . . . ,$0.60 No. 10 White Metal Finish . $0.50

RED GUM

One of the most successful popular entertainment places in the West is at Cedar Point on Lake Erie.

The Cedar Point Coliseum is the largest building of its kind in the world.

It is an enormous Dancing Pavilion.

The Coliseum is three hundred feet long and one hundred and fifty feet wide—covering an area of 45,000 square feet. The point of particular interest about this building for our purpose is that the floor is built entirely of RED GUM.

They bought it because it was cheap and they like it because it is good.

Anyone planning to build apartment houses, office buildings, hotels, residences or specially designed furniture, should defer final arrangements and correspond at once with any of the following firms regarding samples, prices and lists of important buildings of all types wherein RED GUM has been used with eminent practical success and signal artistic satisfaction:

"Standard" SPRING FLOOR HINGES

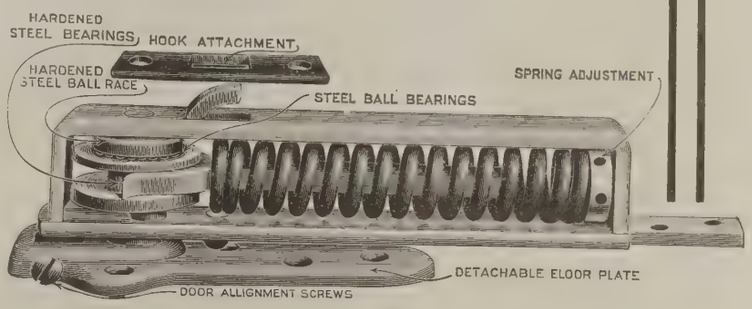
—Double Acting
—All Steel
—Fool-Proof
—Durable
—Simple

"Everlasting service" is not an idle claim but an assured fact with **Standard** Double Acting Spring Floor Hinges. Just a glance at the illustration and a study of the description will convince you how indefinite life is an assured fact. You will be able to see for yourself how our statements of simplicity, durability and compactness are fully borne out by the hinges themselves.

The **Standard** controls doors that swing in both directions. It is absolutely positive in action, moves smoothly and without noise, is adjustable to doors of various weights, holds doors open in either direction and is very easily and quickly applied.

It is of all-steel construction—no malleable or other castings are used at all. The case-hardened ball-bearings and wearing surfaces not only take care of the weight of the door, but the spring thrust too.

Notice the alignment feature in the floor plate; this allows a door to be adjusted to its proper position without changing the position of a single screw. This floor plate is flexible on the hinge post to accommodate itself to uneven floor.



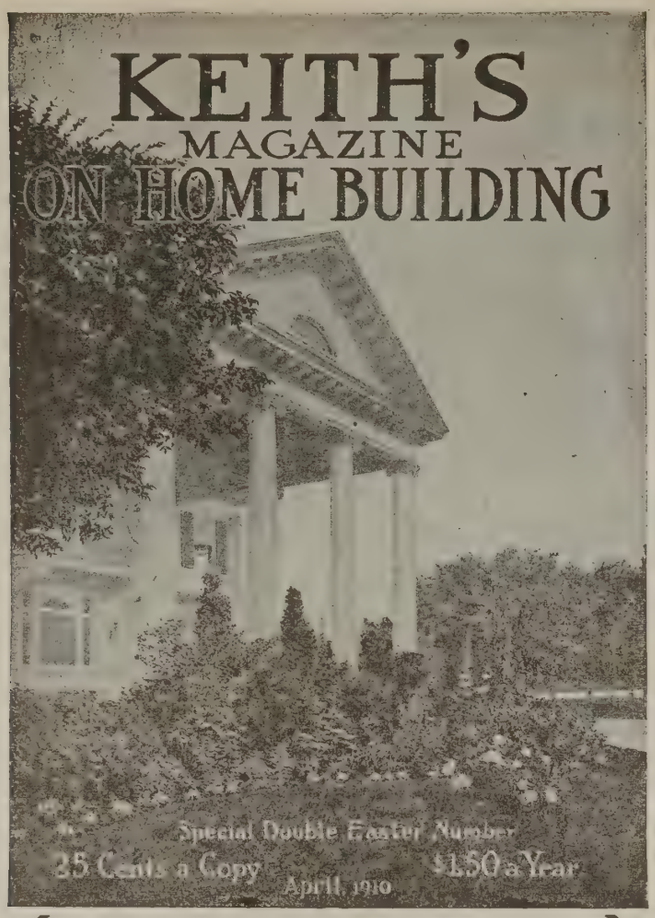
Perfect silence in operation is accomplished by means of a short flexible plunger which is not rigidly fixed in the hinge frame, but takes the same side movements as the coil spring.

A hook-attachment obviates the necessity of making a finished mortise up the rear edge of the door when attaching hinge to door. Furthermore, this feature allows the weight of the door to increase the strength of the fastening. Finish plates are applied to the surface of the door with wood screws—after hinge is on. This method covers any defects in cutting the wood in applying the hinge.

Details Upon Request

No practical carpenter and builder can afford to overlook the many advantages offered in this wonderful hinge. The unique construction and low price allows it to be used, not only on particular work, but on all work. Send a postcard along today for full particulars—or ask your local hardware dealer to show you one.

The Standard Mfg. Co.
Shelby, Ohio



$10.00 For You

We will pay ten cents per word—or ten dollars for one hundred words—to the carpenter or builder who sends us the best argument on why **Standard** Double Acting Spring Floor Hinges are *better* to use than others. This article should not contain more than one hundred words—if it contains less we pay the ten dollars just the same—and should reach our office not later than March 15th. The winning answer will appear in the National Builder later.

We are not looking for a literary masterpiece; all we want is the frank opinion of users—we want to know what your experience has been—how they have satisfied your customers—and how they compare with others. Take a pencil, a piece of paper and ten minutes off, and write us at once, It's very little to do and may earn ten dollars for you.

Subscribe to Building Management

IF you own, operate, superintend or do the renting of an office building or an apartment house, you will want to become a subscriber to BUILDING MANAGEMENT—a monthly publication devoted entirely to the problems of construction, operation and upkeep of big buildings.

This is the only magazine in existence dealing with the management and operation of buildings after they are erected.

It enables an **owner** to find out where the leaks are creeping in. It assists the **manager** to maintain a building at a minimum cost and derive a maximum revenue. It aids the **architect** by showing what other successful buildings have installed, the relation of the construction and equipment to the renting. It helps the **real estate agent** to obtain valuable suggestions on renting, leases and advertising for tenants. It gives the **engineer** and superintendent ideas on operating and service.

On the strength of what we have done and a guarantee that this year is even better, we solicit your subscription. Simply fill out the coupon and send in with your check, or a Two Dollar Bill.

BISHOPRIC WALL BOARD AND SHEATHING

ANY WEATHER is "Good Building Weather" when you use Bishopric Wall Board as a substitute for lath and plaster. It is cheaper and better and does away with all delays in building. It is nailed to studding dry, ready for immediate application of paper, paint, burlap, or any other kind of decoration.

Bishopric Wall Board Easily Applied

This substitute for lath and plaster is made of kiln-dried, dressed lath, imbedded in hot Asphalt Mastic, surfaced with sized cardboard and cut at the factory into 4x4 ft. sheets, which are easily and quickly nailed to studding, ready for immediate application of wall paper, paint, burlap, or other decoration.

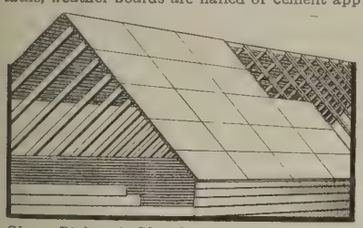
It is applied dry, is guaranteed not to swell, shrink, warp, crack, flake or blister; is clean, sanitary, and odorless; is proof against moisture, cold, heat, and vermin; saves fuel in winter and keeps out summer heat; also deadens sound.

It is suitable for dwellings, factories, new partitions in old buildings, finishing attics, porches, laundries, cellar ceilings, garages, etc.

Applied Dry Winter or Summer

Shows Construction of Bishopric Wall Board

PRICE AND SHIPMENT—Crate of 16 sheets, covering 256 square feet of surface, $6.40 per crate, or $2.50 per 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point.



Cheaper Than Lumber. Saves 75% on Labor. Does away with Building Paper.

BISHOPRIC SHEATHING

Ideal Material for Cement Buildings or Stucco Exteriors. Proof against Dampness.

Bishopric Sheathing is made of same materials as Wall Board, but finish is not necessarily so fine, therefore costs less. It is of uniform thickness, insuring a perfectly even surface when applied.

Bishopric Sheathing is nailed to studs, with lath and asphalt side exposed. Over laths, weather boards are nailed or cement applied.

Shows Bishopric Sheathing over rafters ready for Bishopric Roofing, also Weather-boards over Bishopric Sheathing.

Bishopric Sheathing makes a more solid and substantial wall than lumber. There are no gaping joints; no widening cracks due to shrinkage; no knot holes.

The Asphalt Mastic in Bishopric Sheathing is a non-conductor, moisture cannot penetrate it. It is proof against vermin. The pests cannot bore through the tough, gummy Asphalt Mastic. In applying weather-boards over the laths, dead air space is left between the laths forming splendid insulation. Does away with the expense of building paper and cost of its application.

One wagon load of Bishopric Sheathing covers an area from six to ten times as great as one load of lumber—a tremendous saving in hauling. Five thousand feet can be hauled in an ordinary wagon.

The cost of applying Bishopric Sheathing is but $2.50 per 1,000 feet—A SAVING OF ABOUT 75 PER CENT. Furthermore, 1000 square feet of wood sheathing covers but 750 feet of surface, 20% less being due to tongue and groove. In Bishopric Sheathing 1000 square feet covers 1000 square feet of space.

Wall Board and Sheathing are shipped in crates.

In applying ordinary lumber, heavier scaffolding, more tools and greater scaffold floor-space are required. In applying Bishopric Sheathing, one man drives a few nails in each sheet; a common laborer or boy can finish the nailing.

Bishopric Sheathing insures comfort during the construction of the building. As soon as the building is closed in with Bishopric Sheathing, the men may work in comfort on the inside during bad weather, finishing the outside on suitable days. This insures continuous work, without loss of time, enabling the contractor to hold his men and complete the work in the least possible time.

Bishopric Sheathing is used with equally splendid results under flooring and roofing boards. Used under floors, it serves as a sound deadener and keeps out dampness, used under the shingles, it keeps out summer heat.

ITS MANY USES—Bishopric Sheathing also is used with excellent results as a lining for dairy barns, ranch houses, poultry houses, driving stables or any out-door building where protection from the elements, Summer or Winter is desired.

Bishopric Sheathing is the ideal material for cement exterior or stucco work. Cement firmly adheres to the laths and Asphalt Mastic and makes a solid, smooth exterior. For factory or residence this form of concrete or stucco construction is the cheapest and best known.

Shows construction of Bishopric Sheathing. Arrow points to Asphalt Mastic into which laths are imbedded.

PRICE AND SHIPMENT—Crate of 16 sheets, covering 256 square feet of surface, $5, or $2.35 per square of 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point

Ideal home showing Weather-boards over Bishopric Sheathing, lath side exposed, also Bishopric Roofing over Bishopric Sheathing. (smooth side of sheathing exposed)

Write for Descriptive Booklet and Samples of Bishopric Wall Board, Bishopric Sheathing and Bishopric Roofing---All will be sent free.

Vulcanite Roofing

The Samples Tell The Story SEND FOR THEM

We might easily fill page on page of this publication telling you about the merits of Vulcanite Roofing. We could dilate on its permanency—on its fire-and-water-proof qualities—on the fact that it will not freeze or crack in winter nor crumble in dry weather.

We could describe its construction in a technical way—cite the results of experimental tests and pile up the favorable testimony of actual users who declare that Vulcanite is the best of all composition roofings—could enumerate the high awards Vulcanite has won at expositions, and show you why it costs more to make than any other roofing of its kind.

The contractor and dealer, though, will be more interested in actual samples which will show to his experienced eye and touch just how good, how enduring and how easily laid Vulcanite Roofing really is, and explain why it is the most extensively used roofing in the world. That's why we ask you to

Don't Install Trouble-Making Wooden Seats and Tanks

You know that wooden seats and tanks are made in many pieces and glued, bolted or wired together—that they are constantly warping, opening up and falling to pieces. Wood is porous and absorbs moisture and foul odors, so can never be made sanitary.

Wooden tanks swell and throw fittings out of adjustment.

J-M Sanitor Seats and Tanks

eliminate all these troubles because they are moulded in one solid mass from specially treated wood fibre. They are absolutely unaffected by moisture, so cannot swell, warp or fall apart like wood.

Tanks never swell or throw fittings out of adjustment. Are non-absorbent, therefore do not harbor germs or vermin, so cannot spread disease. **Are absolutely sanitary.**

They are finished equal to wood and have a lustre that is far more lasting.

In some places seats and tanks made of this material have been in continuous service from 16 to 20 years and are practically as good as new.

Write nearest branch for booklet and sample of Sanitor material.

Improperly Covered Steam Pipes Cause Fires

The following which appeared in a recent issue of a leading engineering magazine, shows the importance of covering steam and hot water pipes with a *fireproof* covering, to prevent them setting fire to building:

J-M ASBESTOCEL

"If the contact of wood with a heated surface is continued sufficiently long, the temperature of a few degrees only above the boiling point of water is enough to produce a semi-carbonized film on the wood, which will start smoldering at a very low temperature. The heat arising from an oil or gas flame some distance away is sufficient to start the smoldering combustion. The temperature of a steam or hot-water pipe has often been found sufficient to cause ignition, due probably to the long continued heat generating certain hydro-carbons of low ignition point, which remain occluded in the pores of the semi-charred wood and are there brought into close contact with the occluded oxygen. In fact, a constant draught, or even a sudden rush of air, coming in contact with highly carbonized wood is sufficient to cause serious conflagration."

J-M Asbestocel Pipe Covering is made of Asbestos and cannot burn. It is not only a positive protection against fire from heated pipes, but the most efficient and durable Pipe covering on the market. A postal request will bring the proof to you.

Write Nearest Branch for Sample and Booklet.

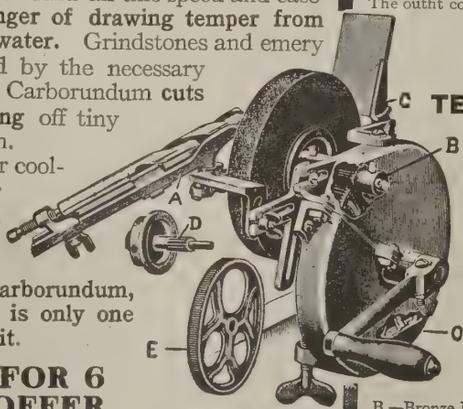
6 Months Free Trial

This Luther Diamond Tool Grinder sharpening outfit will help any shop, factory, contractor, or any carpenter, mechanic or tool user to earn more money. This is exactly what we want you to prove by six months' free use of this **genuine** Luther Carborundum Grinder shop and factory outfit. We want tool users generally to try out this outfit for six months free—to sharpen every kind and as many tools as possible free for six months, and then, if you are not fully satisfied that this outfit is a big money-maker for you, send it back at our expense. Send back the coupon at the bottom of this page for particulars of 6 months' Free Trial, and special offer on shop and factory outfit, also Free booklet about Carborundum.



25 Times Faster Than Grindstones—6 Times Faster Than Emery—Will Not Draw Temper—Not Emery Called by a Fancy Name, But

GENUINE CARBORUNDUM

WILL NOT DRAW TEMPER

Carborundum is a wonderful sharpening substance. There's nothing else like it, or near like it in the world. Nothing except the genuine diamond itself is so hard. In fact, Carborundum is made of artificial diamond crystals, actually **created** in the terrific heat of electric furnaces at Niagara Falls, which fuses the elements of real diamonds into hard, sharp, beautiful carborundum crystals. In this **utmost** heat, far beyond the measurements of science, in which fire brick melts and runs like butter, Carborundum crystals get a temper and sharpness that cuts hardest steel as emery does copper. Wheels actually made of genuine South African diamonds would sharpen tools no quicker. And all this speed and ease of tool sharpening is done **without danger of drawing temper from tools,** and with **no need of cooling with water.** Grindstones and emery **wear** steel away; frictional heat caused by the necessary heavy contact draws the temper. But Carborundum **cuts** steel away without frictional heat, **peeling** off tiny shavings of hardest steel at lightest touch.

No need of heavy pressure, no water cooling needed, no danger of drawing temper if it is **genuine** Carborundum. And you can be highly suspicious of anything described as we have described Carborundum, but called by any name other than **Carborundum,** no matter how fancy the name. **There is only one Carborundum; there is nothing else like it.**

SEND COUPON TODAY FOR 6 MONTHS' FREE TRIAL OFFER

Often you work with dull tools because it's not easy to sharpen them. This **outfit** makes any sharpening the work of only a few minutes. Keen, bright tools mean faster work every moment of the day, and that means **more money made,** to say nothing about the time saved in sharpening and the money saved, because there is no danger of drawing temper, and all your tools will last longer. The Carborundum wheels will outlast any number of emery wheels or any other abrasive. We guarantee the wheels for five years. But don't take our word; let the outfit **itself** prove all this in your own shop, on your **own** tools. If you don't want it after six months' free test, send it back. The six months' use will cost nothing.

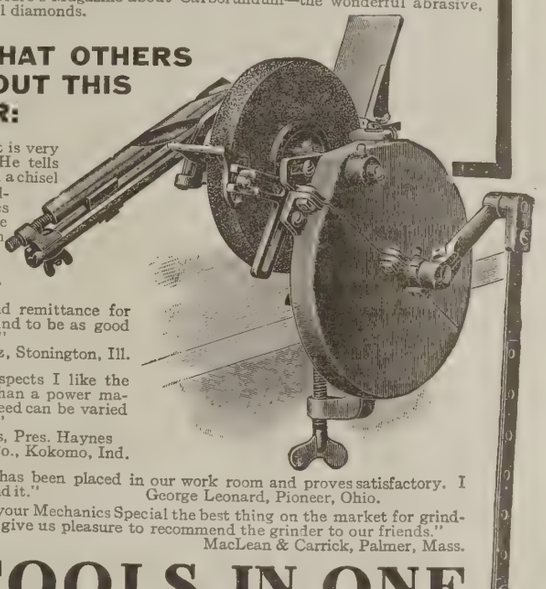
Send back the coupon today and get our liberal Free Trial offer, also interesting story about the discovery of Carborundum, reprinted from McClure's Magazine.

RETURN THIS COUPON

LUTHER GRINDER MFG. CO.
55 Madison Street - - MILWAUKEE, WIS.

Special Offer on Shop Outfit

LUTHER DIAMOND TOOL GRINDER



This genuine Carborundum Sharpening Outfit is a remarkable value—the most liberal, reasonably priced outfit ever offered. It provides for every kind of sharpening, buffing and polishing work. The coupon below will bring you our Six Months' Free Trial Offer, and Special Outfit Offer, also a reprint of an interesting article from McClure's Magazine about Carborundum—the wonderful abrasive, made of artificial diamonds.

READ WHAT OTHERS SAY ABOUT THIS GRINDER:

"Our machinist is very much pleased. He tells us that he ground a chisel on this tool grinder in two minutes which would have taken an hour on the grindstone."
W. H. Sears,
Pentwater, Mich.

"Enclosed find remittance for grinder which I find to be as good as recommended."
S. Schrantz, Stonington, Ill.

"In many respects I like the machine better than a power machine, since its speed can be varied instantly at will."
Elwood Haynes, Pres. Haynes Automobile Co., Kokomo, Ind.

"The grinder has been placed in our work room and proves satisfactory. I heartily recommend it."
George Leonard, Pioneer, Ohio.

"We consider your Mechanics Special the best thing on the market for grinding tools. It will give us pleasure to recommend the grinder to our friends."
MacLean & Carrick, Palmer, Mass.

10 TOOLS IN ONE

The Mechanics' Special Shop Outfit, on which we are making this special offer, embraces ten sharpening appliances. The special attachments make it easy for even inexperienced persons to do difficult grinding, such as twist drills, chisels, etc. The outfit consists of one Mechanics' Special, with the following accessories:

WILL NOT DRAW TEMPER

1. One rough genuine Carborundum wheel
2. One fine genuine Carborundum wheel
3. One Chisel grinding attachment
4. One twist drill attachment
5. One buffer
6. One polisher
7. One genuine Carborundum oil stone
8. One genuine Carborundum hone in leather case
9. One genuine Carborundum sickle stone
10. One foot power attachment

BUILT LIKE A HIGH GRADE LATHE

The Luther Mechanics' Special, forming the basis of this shop and factory outfit special offer, is built substantially for a lifetime of service. The genuine Carborundum wheel will not get lopsided. The Mechanics' Special is built with steel and malleable construction—dust-proof, bronze bearings—machine parts run in bath of oil—machine cut spur gears—speed 2,500 revolutions per minute. It will stand the severest, hardest service, out-wear and give better service than any number of emery wheels, grindstones, or anything else.

A.—Twist drill attachment to give twist drills proper angle and clearance.
B.—Bronze Bearing. C.—Chisel Sharpening Attachment.
D.—Spur gear cut from solid steel.
E.—Large spur gear machine-cut, oil bath.

Return the Coupon Below for Six Months' FREE TRIAL OFFER

FAMOUS
Universal Woodworkers

The FAMOUS JUNIOR for $150.00 is the greatest offer in Woodworking Machinery ever made

This extraordinary bargain in woodworking machinery gives every carpenter, builder and contractor in America the opportunity to install a machine-shop for the total investment of $150.00. The offer holds good until February 1st—after that the price will be increased. The present low price is about 50 per cent below the usual cost; it's made for the sole purpose of competing with inferior machines, and to convince the trade how much extra profit a FAMOUS Universal Woodworker will put in their pocket.

The FAMOUS JUNIOR does eight different kinds of work, and embodies the following eight machines: 20″ Band Saw, 8″ Jointer, Felloe Rounder, Emery Grinder, Saw Table with raising or lowering arbor, Boring Machine, Dadoeing Machine, Vertical Shaper. One man, with no previous experience, can operate the machine; there is nothing complicated, nothing to wear out, nothing to cause the least trouble. It means an end to the planing-mill bugbear, because in addition to saving planing-mill bills, there is the saving in time and trouble. Buying a FAMOUS JUNIOR is like putting money in the bank—only the dividends are bigger.

Half Price—Until February 1st

Hundreds upon hundreds of contractors have already taken advantage of our "half-price" offer. You have a clear month to make your application and to lay the foundation for a more profitable business. The year of 1911 will be a busy one for contractors and builders—prepare to meet it by installing the FAMOUS JUNIOR. Think of it—a complete machine-shop for only $150.00 (there are positively no extras).

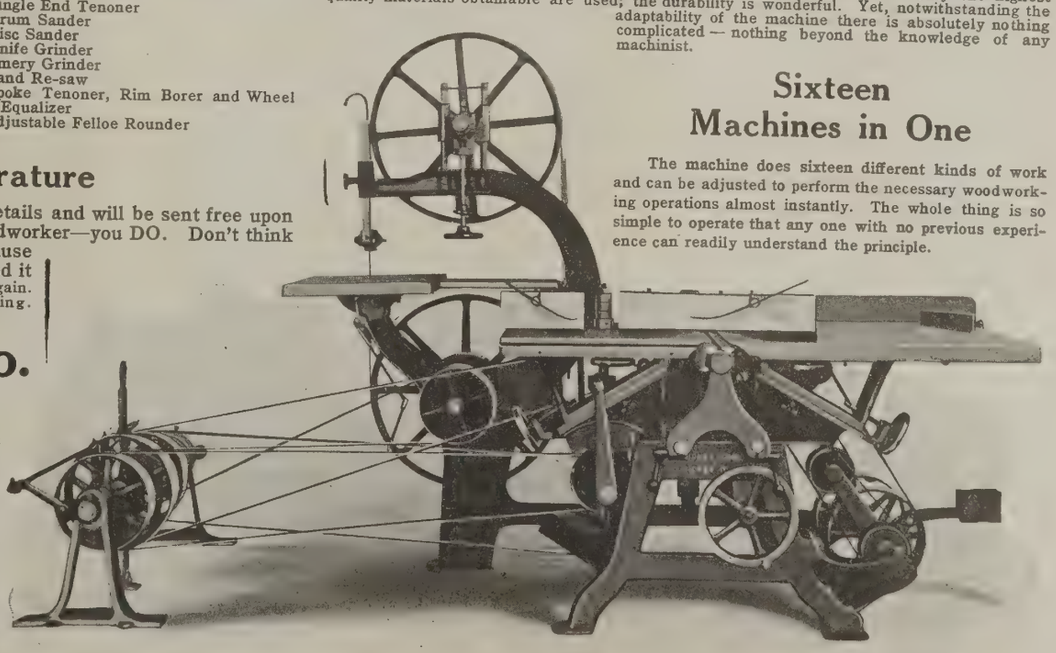
The FAMOUS JUNIOR is for hard service. We guarantee it—not for a year but for LIFE. Doesn't matter how long you have it, our guarantee is always good. No other manufacturers of woodworkers in the world can afford to make such a sweeping guarantee. But we know what the FAMOUS JUNIOR IS. We know how strong it is—how simple in construction and operation, and how it will live up to its guarantee. Yet the total outlay that you are called upon to make is $150.00. And then we sell on trial and will take time payments

The FAMOUS No. 14 is an Ideal Woodworker for Contractors' Use

While our FAMOUS JUNIOR is the best universal woodworker on the market day for small contractors and builders, this No. 14 FAMOUS is unquestionably e most satisfactory for carpenters, builders and contractors who have a large nount of millwork done, and a great variety, as on the one machine SIXTEEN IFFERENT KINDS OF MILLWORK CAN BE DONE, SIMPLY BY MAKING FEW SIMPLE AD JUSTMENTS.

The No. 14 FAMOUS Universal Woodworker is, without the shadow of a doubt, e most unique piece of woodworking machinery, and the greatest time and labor ver, ever invented. On the one base are embodied the following sixteen woodrking machines:

1. 27″ Band Saw
2. 12″ Jointer
3. Saw Table with raising and lowering Saw Arbor
4. Single Spindle Shaper
5. Boring Attachment arranged on Special Boring Spindle
6. Pony Planer
7. Tongue and Pole Rounder
8. Hollow Chisel Mortiser
9. Single End Tenoner
10. Drum Sander
11. Disc Sander
12. Knife Grinder
13. Emery Grinder
14. Band Re-saw
15. Spoke Tenoner, Rim Borer and Wheel Equalizer
16. Adjustable Felloe Rounder



RECORD SALES FOR 1910

Over five hundred contractors bought FAMOUS woodworkers during the past year; over a thousand will buy during 1911. We have never had a machine returned for repairs—we have never had an unsatisfactory report. Such a record points to a machine possessing REAL MERIT—a proposition which every contractor should inquire into.

Think what it means to install a machine that does the work of sixteen. Consider the saving in initial cost—in ultimate cost—in power transmission equipment—in floor space—in time—in labor. And remember that we guarantee the machine for life. Only the highest quality materials obtainable are used; the durability is wonderful. Yet, notwithstanding the adaptability of the machine there is absolutely nothing complicated — nothing beyond the knowledge of any machinist.

Sixteen Machines in One

The machine does sixteen different kinds of work and can be adjusted to perform the necessary woodworking operations almost instantly. The whole thing is so simple to operate that any one with no previous experience can readily understand the principle.

Send for Literature

We have special literature telling all the details and will be sent free upon quest. Don't think you do not need a woodworker—you DO. Don't think u cannot afford a FAMOUS woodworker—because u CAN. Once you get the machine installed it l pay for itself each month—and save money in the bargain. ite for literature at once—before you do another thing.

Samson Spot Sash Cord

IS made of extra quality fine yarn, and warranted free from imperfections of braid or finish. It can always be distinguished by our trade mark, the Colored Spot. Carried by all dealers. Send for samples and tests.

Samson Cordage Works

BOSTON, MASS.

The Boss Improved Floor Scraper

Has double swivel allowing the knife to be set in any position. Gauge can be set for any thickness of shaving and keeps knife from making depressions in floor. Gives knife double support. The pear-shaped wheel which is in the gauge is attached to the gauge in front so that when the scraper is let down to take shaving, it lets the knife down gradually, and prevents the knife from making a deep cut. With this gauge and wheel attachment, the knife will leave no mark. Impossible to do poor work. Adjustment simple—positive. Gauge can be removed instantly. Sanding attachment. Prices very low. Write for descriptive circular.

GEORGE J. KEPPLINGER
DWIGHT, ILLINOIS
Adv. Dept. B.

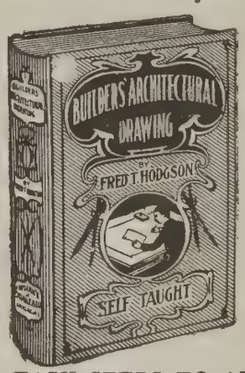
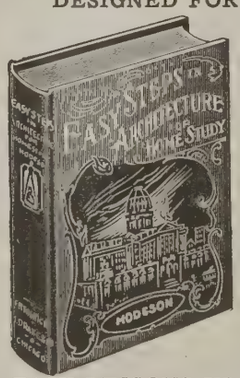
PRACTICAL BOOKS FOR THE BUILDING TRADES



THE STEEL SQUARE—TWO VOLUMES. A PRACTICAL TREATISE ON THE USES OF THE STEEL SQUARE. By Fred T. Hodgson. 600 Pages, 500 Illustrations.

Two Vols., Cloth Binding. Price.....$2.00
Single Vols., Part I, Cloth. Price..... 1.00
Single Vols., Part II, Cloth. Price..... 1.00

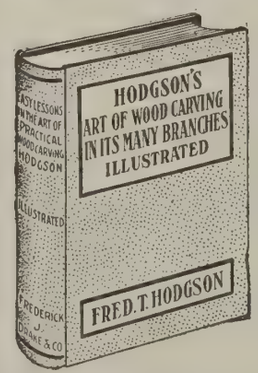
Mr. Hodgson was the first—as well as the last—person who has written on this important tool, and the two volumes now issued contain the earliest and the latest up-to-date methods of applying the STEEL SQUARE for the solution of the many problems this wonderful instrument can solve when in capable hands. The two volumes, named herewith, contain about all that is possible to be done with the square, that is of practical value to the workman, and, as they show nearly all the simple, as well as the difficult things, that can be accomplished with the aid of this tool, there will be little trouble for the workman to work out any minor problem that may confront him, if it is within the purview of the tool. In short, the two volumes contain all that can now, or hereafter, be accomplished with the square. They are profusely illustrated with diagrams, and explanatory sketches, which cover the whole ground of steel square practice. Two volumes of the greatest possible value to the young carpenter.



BUILDERS' ARCHITECTURAL DRAWING SELF-TAUGHT. By Fred T. Hodgson. F. A. I. C. 336 Pages, 250 Illustrations and 18 Folding Plates, 12mo, Cloth Binding. Price.....$2.00

This work is especially designed for carpenters and for students of architecture, woodworkers and others who desire to learn drawing at home, and who have not the means, time or opportunity of taking a regular course in school, or college, nor of availing themselves of the offers made by one or other of the "Correspondence Schools."

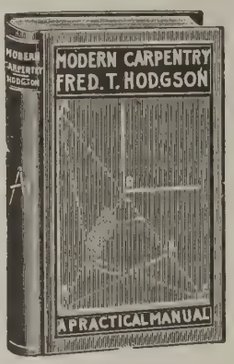
The work commences with a description of drawing instruments and accessories, with rules for using them, and hints as to their care and management. Rules for laying out simple drawings and executing same are given, and the student is taught step by step to draw to scale, first the plans, next the elevations, and finally the details of a cottage, including foundations, walls, doors, windows, stairs and all other items required for finishing a small building complete in every particular.



EASY STEPS TO ARCHITECTURE. PARTICULARLY DESIGNED FOR HOME STUDY. By Fred T. Hodgson, F. A. I. C. 350 Pages, 230 Illustrations, 12mo, Cloth Binding. Price .$1.50

As every mechanic employed in the building trades must necessarily have some knowledge of architecture, a book of this kind will be found by him to be a great assistance in acquiring such knowledge without a great expenditure of effort. A part of this work has been for years a sort of text-book in schools where architecture is taught, and is a catechism to some extent. The questions and answers are easily understood and as easily remembered.

The second part of the book deals more particularly with architectural styles, while the first part is mostly devoted to the classic orders, Greek and Roman. Full explanation of the latter styles are made, and illustrations show these styles and give a brief history of their growth and decay.



EASY LESSONS IN THE ART OF PRACTICAL WOOD CARVING. By Fred T. Hodgson, F. A. I. C. 284 Pages, 200 Illustrations, 12mo, Cloth Binding. Price.....$1.50

This work, "Easy Lessons in Practical Carving," is prepared in the same happy, easily understood style of writing that has made the name of the author so famous among the working men of English-speaking countries.

The lessons given in this new book begin at the very beginning of carving and lead the young workman by easy steps through the mazes of the art, until he is able to turn out work of a creditable character. The use and care of carvers' tools are given and explained, and the tools described and shown in illustrations, with methods of sharpening and honing the tools, in a clear and interesting manner. All necessary appliances are shown, described, and illustrated, both for holding the work, and for preparing the tools and finishing up the carvings. The various styles of carving are fully explained, such as flat carving, chip carving, incised carving, scratch carving, figure carving, carving in relief, round carving and jewelry carving.

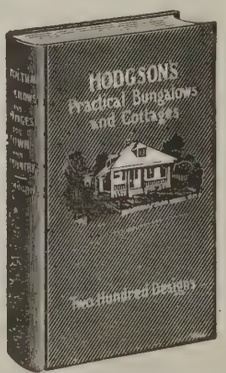
MODERN CARPENTRY AND JOINERY—VOL. I. By Fred T. Hodgson, F. A. I. C. 300 Pages, 318 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is a real modern work, and the large numbers of it that have been sold (over one million) is an evidence that American workmen have found in it the things they expected. It is one of the best books of the kind ever brought out for teaching the young workman the art of correct and easy wood-working. It shows how to lay out roofs, rafters, stairs, hoppers, bevels of all kinds, mitering, coping, circle work, flooring, splayed work, plain stairs and handrailing, cornicing, dove-tailing and many other things the young carpenter will require to know in the performance of his regular work. It is written in a very simple style, and can be understood by any person who can read every-day English. Unlike other works prepared for workmen, it is void of bewildering formulae and algebraic puzzles, and the reader is not asked to wade through long mathematical calculations to get at the kernel of the subject before him. The work contains some 300 illustrations and diagrams, all of which are explanatory and instructive.

MODERN CARPENTRY AND JOINERY—VOL. II. ADVANCED SERIES. By Fred T. Hodgson, F. A. I. C. 400 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This volume is somewhat similar to Vol. I, only on advanced lines, and is intended to follow up the progress made by a study of the first. Indeed, it is simply a continuation of the first volume, on a higher plane, and no workman having mastered the contents of one, will rest satisfied, until he has also mastered the contents of the second volume.

This volume contains some examples of work, with a description of the way the work is performed, and the materials employed. Many very difficult problems are here shown and the solutions and explanations are given and fully explained, many things that at first seem formidable to the unpracticed workman, become quite easy of solution under the magic wand of the author's method of explanation.



COMMON SENSE STAIR BUILDING AND HAND-RAILING. By Fred T. Hodgson, F. A. I. C. 300 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is an excellent work for the young carpenter who is ambitious of becoming an expert in handrailing and stairbuilding, inasmuch as it commences at the very beginning of the art, and shows how to lay off a stair on the floor, placing the newels, laying off treads and risers, strings, winders, wells and flyers.

The object of the author is to lead the student step by step, in such a way that he takes in the whole art of stairbuilding before he is aware of it. This is decidedly the best and most practical work on stairbuilding in the market, and just what the untrained workman wants. The part of the book devoted to handrailing exhibits three different methods of laying out and working handrails suitable for any kind of stairs, straight, circular, elliptical, or for stairs with landings, doglegged, newels, or cylinders. These systems of handrailing have been taken from the best sources on the subject, and have been revised and edited in the most careful manner.

PRACTICAL BUNGALOWS AND COTTAGES FOR TOWN AND COUNTRY. Arranged and Edited by Fred T. Hodgson, assisted by E. N. Braucher, Architect. 12mo, Cloth, 420 Pages, 400 Illustrations. Price.....$1.00

This work contains perspective views and floor plans of over two hundred choice bungalows, cottages, houses and flat buildings, selected with great care to combine architectural beauty, convenience and economy of construction, ranging in prices from $500.00 to $3,800.00. Every plan shown is made by a licensed architect and has been built from, to the entire satisfaction of the builder and within the estimated cost. This work will be found invaluable to the home builder, furnishing many new and up-to-date ideas and suggestions in modern architecture. The number of California bungalows, which the editors have taken great pains to select, are without question the most attractive modern low cost homes ever built. We are prepared to furnish blue prints at a very moderate cost, ranging from $5.00 to $15.00, according to cost of erection, consisting of floor, roof and foundation plans, front, side and rear elevations, with complete type-written specifications.

Any of the above books sent Post or Expressage Prepaid on receipt of price.

ARCHITECTURAL

DRAFTSMEN WANTED

THAT CAN DRAW THE HIGHEST SALARY

$ $ $ $

ONLY THE BEST PRACTICAL MEN WANTED

MEN WITH BRAIN NOT WITH BOOKS CAN ONLY SUCCEED

Good Draftsmen are ALWAYS in Demand ALWAYS Busy, ALWAYS Drawing Good Salary

The Work is Pleasant, Interesting, Clean and Leads to Best Paying Highest Positions

If you are ambitious, bright and anxious to learn I can train you at home on practical, actual Drafting room work in a short time for a position $125-$150 monthly. Only a limited number can receive my personal training.

I DON'T SELL YOU a lot of books to look at with disgust or to lay on a shelf to be covered with dust.

I DON'T SELL YOU printed school lessons or pictures to copy. You MUST learn on actual Drafting room work.

I DON'T SELL YOU or give you a worthless "cheap-skin" Diploma to hang on the wall and that will be all.

BUT I TRAIN YOU until competent; more than that, until placed in position at above salary.

AND I TRAIN YOU personally and individually to advance you as fast and far as you can go.

AND I TRAIN YOU on practical work to give you required UP-TO-DATE, PRACTICAL WORKING EXPERIENCE.

Remember:

I AM NOT teaching 227 different trades — ONLY ONE and THAT ONE right.

I AM NOT looking for students—they look for me, for I have been at this over 22 years.

I AM NOT accepting every one that has the price—only those anxious to succeed with me.

I would rather train a few students and satisfy all than to accept many and have some dissatisfied.

I furnish all Instruments and Working Outfit (not school set), this HIGHEST GRADE FREE.

If you want to be a GOOD DRAFTSMAN, drawing good salary, write to me NOW.

Address, CHIEF DRAFTSMAN, Div. 6

DRAW GOOD PLANS and DRAW GOOD MONEY

WITHOUT DOUBT many readers have in the past wished to be successful, first-class Draftsmen and Designers, and probably often looked for a long time at plans and drawings, trying very hard to figure out certain lines, or experienced an intense desire to be able to do the best work in most up-to-date manner; and many men in most any kind of business, especially in Architectural lines, have often felt greatly embarrassed simply because unable to read even a simple sketch or unable to make any kind of business-like drawing.

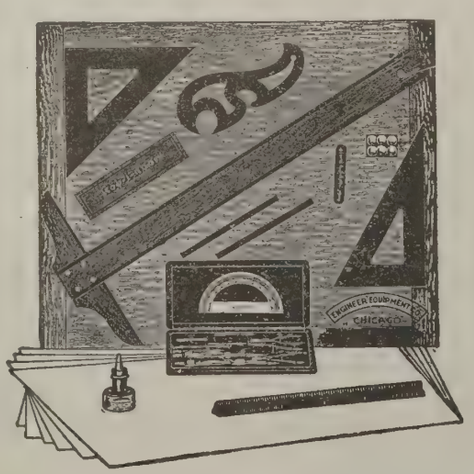
No carpenter is first-class and competent unless he is an A-1 Draftsman in addition. Without this knowledge he can never rise any higher and will remain only a Carpenter paid by the hour or day.

To become a successful Draftsman it is necessary, first of all, to receive the most practical and personal training. Not a lot of school or book knowledge, but practical Drafting-room work.

Mr. F. B. Dobe, Chief Draftsman of the Engineers' Equipment Company (inc.), Chicago has for many years made a practice of giving personal and individual Drafting instuction in complete Architectural drawing and Building design; and is prepared to accept a few more personal students, young or old. His instruction is given by mail, but must not be compared with ordinary "for all alike" correspondence school lessons, as all the work is laid out personally by himself and prepared especially for your individual requirements and advancement. He treats each student according to the student's ability; and with his individual practical method, which consists of actual Architects' work.

INSIDE OF A DRAFTING ROOM
Where draftsmen Draw from twenty-five to seventy-five dollars per week

GOOD DRAFTSMEN IN DEMAND



JUDGING by the manner in which many carpenters and contractors are getting in communication with Mr. F. B. Dobe, of the Engineers' Equipment Company, and signing up for his personal instructions in architectural draftsmanship, they are realizing the necessity and pleasure of making more money. The opportunities offered today for ambitious, wide awake and progressive men capable of making from $25.00 to $75.00 per week as architectural draftsmen are better than ever. The immense amount of building which is going on and the increasing demand for more and larger structures, gives the man with actual drafting room experience splendid opportunities for steady employment at high wages, besides the chance for advancement. There is no class of men who make better architectural draftsmen than the carpenter and contractor.

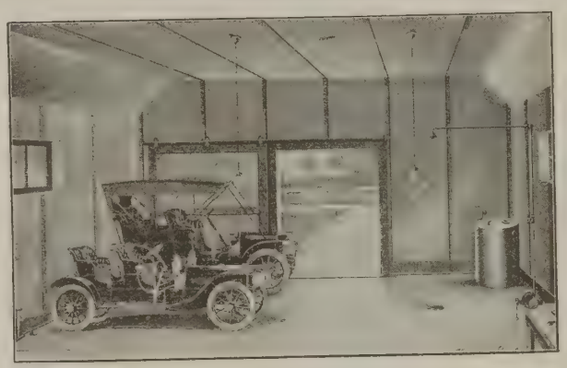
Mr. F. B. Dobe

The experience gained by actual work on all kinds of buildings makes it much easier in studying and also in holding a responsible position afterwards. No employer cares for diplomas—neither does he care or will pay big wages to just a mere copier. What the employer wants today is originality and practical ability, and this requries practical training. The quickest and best way to be trained on practical drafting room work and to get the required practical experience is to receive personal and individual instruction from a high grade practical man at the trade, with a reputation as the most experienced man in training men to become competent and successful draftsmen.

An ordinary draftsman, not even the best draftsman, can teach this trade unless he has had many years of experience as an instructor, and has ability to impart knowledge that is understood and will stick forever. A special gift that 99 out of 100 do not have.

This Outfit, value $13.85, furnished free by Mr. Dobe to his students

Mr. F. B. Dobe, chief draftsman of the Engineers' Equipment Company (Inc.), Chicago, with twenty years' experience in training and handling men, has for a good many years given personal individual instruction by mail with the most deserving success, because his instruction work consists of actual drafting room work that gives his personal student and apprentice the required practical experience.



Mr. Dobe has been an advertiser in this paper for a good many years and will send his "Successful Draftsmanship" prospectus, 6 by 9, also list of open draftsmen positions and full information free. His advertisement appears on last page of this paper. Anyone interested should write to him.

THE NATIONAL BUILDER

Vol. 52 CHICAGO, JANUARY, 1911 No. 1

THE RUSSEL HOUSE

NATIONAL BUILDER DESIGN No. 337

Built at Omaha, Neb., I. P. Hicks, Architect

For Floor Plans, Elevations and Details, See Supplement of This Number. Estimated Cost, Architect's Fees Not Included, $8,671.00

THE RUSSEL HOUSE

A house of stately design recently built at Omaha, Neb., is shown in the supplement sheet this month. The feature that dominates the design is the front portico with classical columns running through two stories by which the design strongly favors the colonial. The dip of the roof at the eaves is another prominent feature of the exterior.

The photograph shows the sweep of the porch along the left side to the large bay window of the sitting room from which access is had to the side steps of the porch.

The exterior is of siding and the roof is shingled. The first floor plan contains the reception hall with seat and stairway to the second floor; a colonnade opens into the parlor from which the sitting room is entered through sliding doors. The dining room is accessible from both the parlor and sitting room. In the second floor are five chambers and the bath room. The house throughout is very conveniently arranged and contains all manner of accommodations not found in the ordinary house. The roof plan is one that is unusually difficult to frame, and it is the subject of an illustrated article in this number, which will interest many readers.

ESTIMATING THE HEATING SURFACE OF A BUILDING

In his work, "Baldwin on Heating," William J. Baldwin gives the following rules for estimating the amount of heating surface necessary to maintain the heat of the air of enclosed spaces in buildings to the desired temperature:

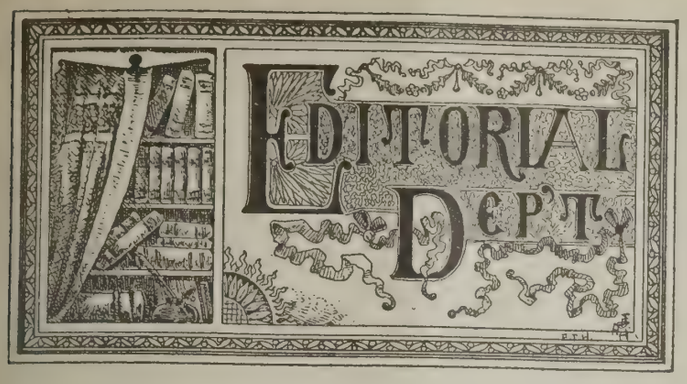
The heating surface necessary to warm a room, of course, should be proportional to the cooling surface, and the glass of the windows and the outside walls form the largest factors in cooling. The glass which forms the windows forms the highest cooling factor in ordinary practice, and it may be taken as 1,000, in which case the following table shows approximately the value of other building materials:

Window glass	1,000
Oak and walnut sheathing on walls	66 to 100
White pine and pitch pine	80 to 100
Lath and plaster, walls good	75 to 100
Lath and plaster, common	100 to 150
Common brick (rough)	150
Common brick (hard finish)	200
Common brick (hollow walls, hard finish)	150
Sheet iron	1,100 to 1,200

A square foot of glass and a square yard of ordinary outside wall have about the same cooling value. It has been found that 1 square foot of heating surface with steam at 1 pound pressure will just about offset the cooling done by 2 square feet of glass, when the outside temperature is 70 degrees. This is so well established now that it need not be questioned. In the early days of steam heating the writer was acquainted with this fact, and he devised the following rule:

Divide the difference in temperature between that at which the room is to be kept and the coldest outside atmosphere, by the difference between the temperature of the steam pipes and that at which you wish to keep the room, and the product will be the square feet, or fraction thereof, of pipe surface to each square foot of glass (or its equivalent in wall surface).

Thus: Temperature of room, 70 degrees; less temperature outside, 0; difference, 70 degrees. Again: Temperature of steam pipe, 212 degrees; less temperature of room 70 degrees; difference, 142 degrees. Thus: 70÷142=0.493, or about one-half of a square foot of heating surface to each square foot of glass, or its equivalent.



It must be distinctly understood that the extent of heating surface found in this way offsets only the windows and other cooling surface it is figured against, and does not provide for cold air admitted around loose windows, or between the boarding of poorly constructed wooden houses or for ventilation. These latter conditions, when they exist, must be provided for separately.

Sometimes orders are procured by simply exhibiting photographs of buildings previously remodelled with the improved lighting sash. There is considerable work ahead for the trade in this line.

Warman—"Ours is the worst neighborhood for gossip I ever saw."

McNix—"Why so?"

Warman—"If they see carpenters coming out of your house they'll pass it around that you're keeping boarders."

1911!!

Wishing each and every one of you, a happy, peaceful, and prosperous New Year.

* * *

Let the good resolutions made at the first of the year, remain with you, and hold fast to you, during the whole of this 1911.

* * *

It has been the custom for several years with many of our readers who are employers of labor, to gladden the hearts of a number of their deserving workmen each year, by presenting each of them with a paid-up subscription to THE NATIONAL BUILDER, for the incoming year. This is an excellent custom, and one that must commend itself to people who are desirous of bettering the conditions of their working men. The generosity of the employers is more than amply rewarded by the better efforts, and improved efficiency of the men receiving the journal. You have not adopted this custom, of giving to your younger employers, some token or reward for their services rendered or services anticipated, should try this experiment, and we are convinced you will be agreeably surprised. You need not confine your gifts to the giving of THE NATIONAL BUILDER. There are many suitable books advertised in our pages, from which some special one, particularly adapted to the requirements of the individual for whom the gift is intended, that could be presented with profit to both giver and receiver, besides, it is always more "blessed to give than to receive."

* * *

There are other things besides "THE NATIONAL BUILDER," or technical books, that may be suitable and appropriate gifts to workmen. Take for instance, a pair of saws. "A cut-off and a rip"—or the one hundred and one other tools, such as planes, chisels, hammers, mitre boxes, scrapers and gauges. What better gift to a plasterer, or a bricklayer than a set of trowels, pointers, plaster molders, floats, etc.? These little evidences of appreciation by the employer, when given in a proper spirit, will most assuredly bring back profits on the investment, added to by the gratification of knowing you have helped on the road to success, a struggling laborer, whose load of home responsibilities, debarred him from purchasing the class of tools that would enable him to perform a greater and a better service in a shorter time. An old Scotch saying has it, "That naething is lost a freend gets," might be amended and made to read—"That what ye gae to yer deserving workmen, is money saved."

* * *

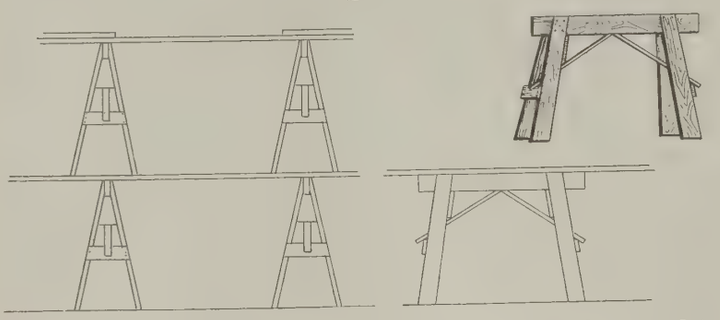
Dealers who advertise in this, or similar journals, and who have no further use for this paper, after looking over it, would be doing themselves and some deserving workmen, good service by giving their paper to them as they are published, instead of casting them into the waste-basket or throwing them on the floor for the office boy to destroy. It may be that in some instance or another, you may, by this little act of kindness, kindle a spark of action or genius, that will one day be of great importance to the world at large. "Do good and be happy!"

* * *

The policy of THE NATIONAL BUILDER, has always been of a conservative kind. We have at all times refrained from "blowing trumpets or beating drums," or announcing ourselves as the "biggest thing on earth," and have confined ourselves to "pegging away" in our own sphere of influence, that is to say, we have made no attempts to invade the domains that properly belong to the purely high class architectural journals such as "The American Architect," "The Western Architect," "The Architectural Record," and a few others, but have contented ourselves with working among contractors, operative builders, and decorators, and in these fields, we are vain enough to think we have been fairly successful, owing in a great measure, we fancy, to the fact, that we know—from personal knowledge—what to serve up to readers in these classes, and, we imagine, we have served it up in such a manner as to be acceptable to those for whom the meats were intended; as evidence of this, we have but to call the attention of our readers to the figures showing our circulation. No journal devoted to the interests we represent, ever before had a circulation as large as these figures show, either in this country of "immensities," or in Europe; but these figures were not reached without effort, and a very large expenditure. We are not given to boasting or of making promises, but sometimes it is necessary to inform readers of some of the things they may expect during the coming year, and because some of our subscribers have intimated they would like to get information on the several subjects asked for in their correspondence. We have engaged the services of an expert to prepare for our pages, a series of articles on STEEL CONSTRUCTION, also wood and steel construction, and brick, concrete, and steel construction. A series of papers on Architectural Drawing, lettering, etc., will be continued. A column of real practical hints and methods will appear each month, and articles of interest to the workman, contractor and builder, will be furnished by our regular correspondents, and our question and answer columns will give every reader of the paper a chance to ask for any information he may want, also opportunities to air his views on any of the subjects submitted or discussed. We can safely say to our readers that the NATIONAL BUILDER for 1911 will equal in every particular, and excell in many, any previous issue of the paper, and this is saying a great deal.

* * *

While some people live in cellars, others live in $25,000 rented flats. Until lately no millionaire in New York could, if he wished, pay a higher rental than $20,000 a year for his flat. But that disability has now been removed. They are building in Fifth avenue a block of flats, seventeen in number, each of which is to be rented at $20,000 a year. Each flat contains eighteen rooms, of which the four principal rooms—salon, dining and living rooms, and gallery—cover an area of 2,500 feet, which can be converted at will into one immense hall for entertaining. Each flat has its own elevator, refrigerating plant, and incinerating apparatus for the destruction of refuse, as well as vacuum cleaners and electric laundry and ironing machinery. Of course the appointments of the living rooms are amazingly luxurious.



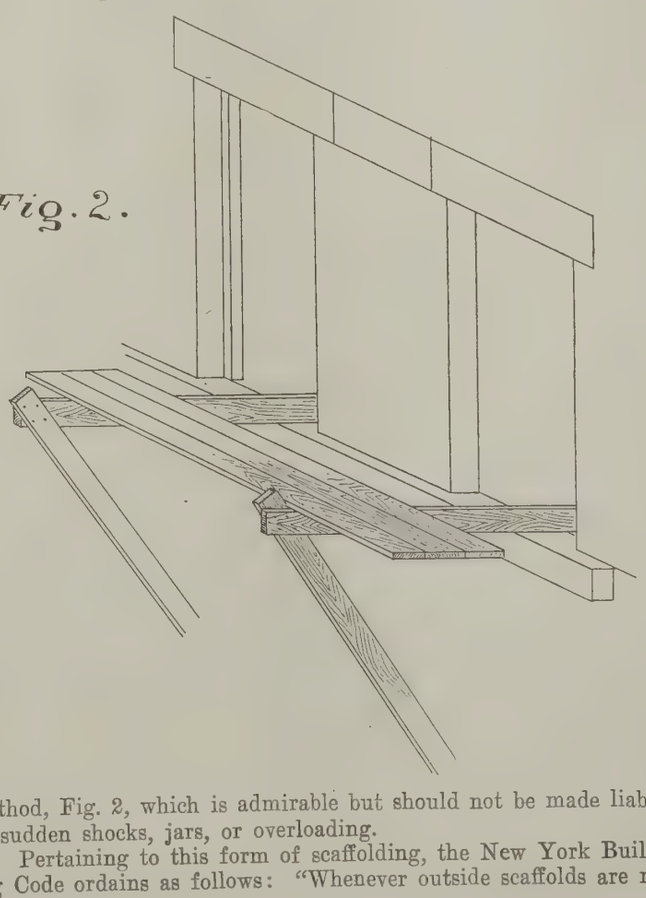
THE IMPORTANCE OF SAFE SCAFFOLDING

By OWEN B. MAGINNIS

AMONG the numerous auxiliaries employed in, or essential to safe and successful building construction, there is none more important than the scaffolding, so in this article it is my intention to consider it in its most practical sense and analyze some details.

The word or technical term "scaffold" is very ancient, like the trade or art itself, having been employed in building and engineering works from time immemorial, but as it is not the purpose

Fig. 1.



of this article to treat the subject historically, we will proceed to the actual modern practice.

Primarily of course, the first and perhaps the most useful appliance we meet with for ordinary heights, is the sawhorse, or mason's horse, familiar to all readers, but they can be built up to any height in tiers as shown at Fig. 1, where a series of two tiers is represented.

Assuming that one row of horses gives a height of 4 or 5 feet, two would give 8 or 10 feet 2 inches, the thickness of the planks being added, so 3 tiers would give 12 feet 4 inches or 15 feet 4 and so on, as required to the height desired.

The old form of pole and putlog scafford is rarely now used on the western hemisphere, having been superseded, either by a series of sawn square timbers framed or cleated together after the fashion of Fig. 3, or the adoption of the outrigger or thrust-out

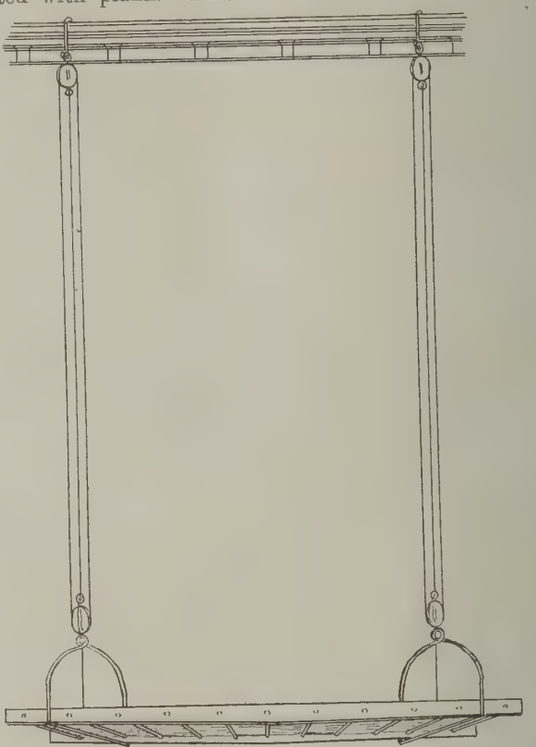


Fig. 2.

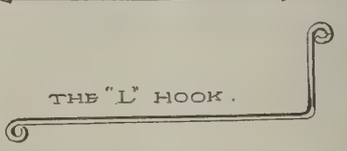
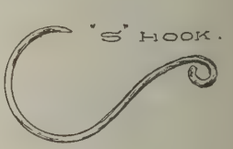


method, Fig. 2, which is admirable but should not be made liable to sudden shocks, jars, or overloading.

Pertaining to this form of scaffolding, the New York Building Code ordains as follows: "Whenever outside scaffolds are required to carry on the construction of buildings over eighty feet in height, whether the same be constructed by poles or thrust-out scaffolds, there shall be erected on its outer edge and ends an enclosure of wire netting of not over two-inch mesh, or of boards not less than three-fourths of an inch thick, placed not over one and one-half inches apart, well secured to uprights, not less than two inches by four inches, fastened to planks on timbers and resting on putlogs or thrust-outs. * * * The said thrust-outs shall be not less than three-by ten of spruce or yellow pine and to be doubled or trippled, as may be required for the load to be carried, and to be thoroughly braced and secured; or said timbers can be in one stick in proportion to the load.

The flooring on thrust-outs and putlogs shall be tightly constructed with plank. This said floor and enclosure shall not be



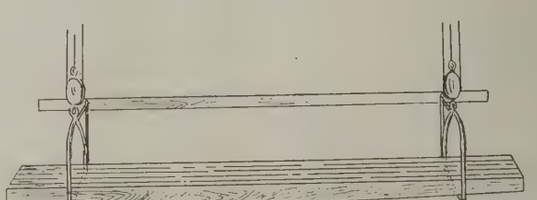


Fig. 4.

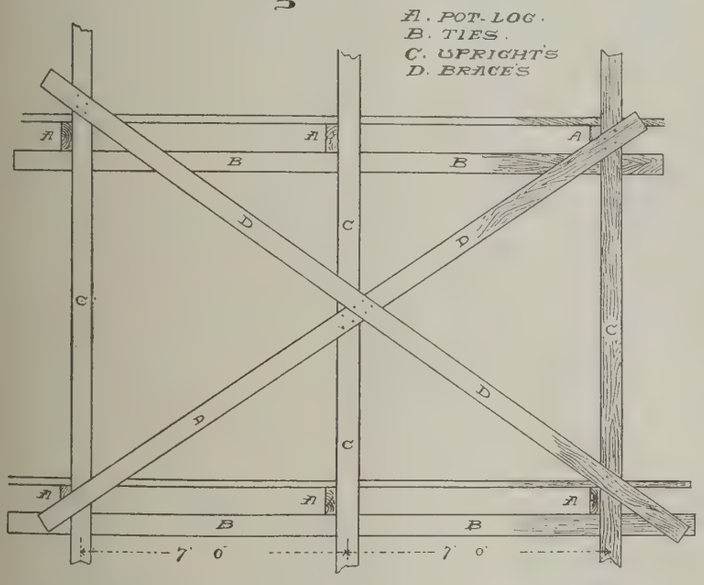
removed until a like floor and inclosure is already prepared and in position on the story above."

From the foregoing excerpt, builders will realize how the pedestrian public is protected, but those who are practical will note that the safety of this form of scaffolding is entirely dependent upon the strength of the timber, and as accidents have already occurred through the sudden fracturing of a thrust-out, it behooves both the foreman or whoever is directing the operations and the men also to examine each timber minutely, though to my mind



it would be better to add supporting braces indicated in the sketch, if a footing can be found for the bottom ends, which may be often obtained on the sills below.

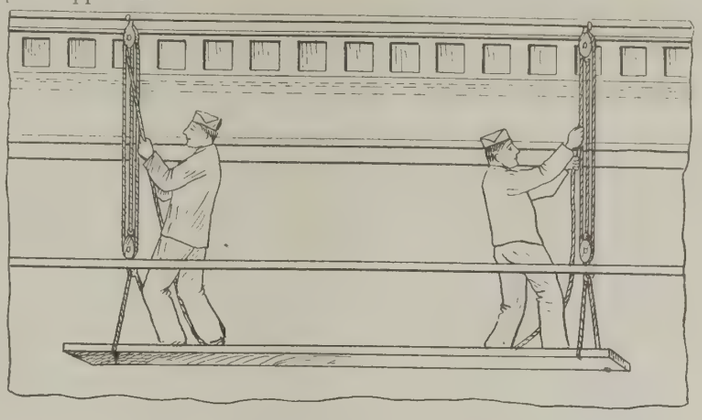
At this juncture, we must take up the matter of nailing, when putting up the different parts of scaffolds together. This should be done most carefully, and not in the slipshod fashion in which I often see it done. If cut nails are used, they shoud have their flat sides running parallel with the grain of the wood, be dovetailed or driven in an oblique ar slanting direction, well in, until the head is buried in the woody fibre. It is a dangerous mistake not to drive them home, and I once, in the east, knew a buidler who was so anxious to save nails that a scaffold broke, a carpenter was killed, and $2,000 of the builder's money went to console the widow and children.

Similarly, it is not always wise to trust too much to the bearing value of nails, so when a scaffold is to be weighted with materials, it would be well to nail cleats, or blocks under the putlogs or ledgers to gain extra strength and safety.

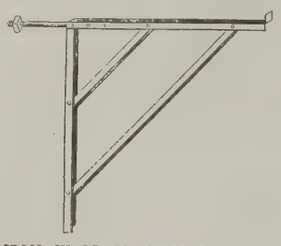
For scaffolds for great height, there is no method which excels that represented in Fig. 3, which is, as all readers will note, simply the reliable, time-honored system of diagonal bracing worked out in elevation as a series of squares, oblongs or paralellograms, the uprights being the sides, the putlogs or bearing ledgers, the top and bottom lines, and the braces the diagonals. The nailing and bolting is as usual.

Fig. 3.

For outer or front wall scaffolds of this description, I would recommend that the outside, or street side line of uprights, be battered, or sloped from the edge of the sidewalk or curb line up, and that the whole structure be securely bound to each rising and succeeding tier of floor-beams, with cables or ropes.

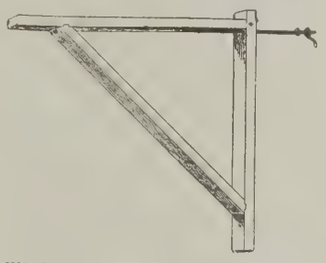


This cut shows two trusses and a plank used as a temporary stage. This arrangement is simple but very strong and firm.



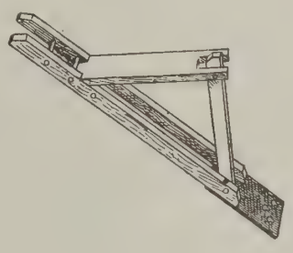
This Standard, or Parlor Truss, is usually made in sets of six or more. With a set of six and a few planks a scaffold for frescoing a room 15x25 ft. can be very quickly made. Height, 6 to 12 ft.

Coming now to the subject of swinging scaffolds which in these days of the construction of very high buildings play so important a part, I would draw the attention of readers to the illustration where a scaffold of this character is shown swung ready for the mechanics. It is used by masons and bricklayers for pointing up and washing down, in masonry and brickwork, by painters for their work, also for whitewashing or repairs, as the occasion demands, and it is therefore a very essential part of a builder's plant. In this sketch is shown also the necessary hook which combined with the blocks and tackle make up the whole complete appliance.



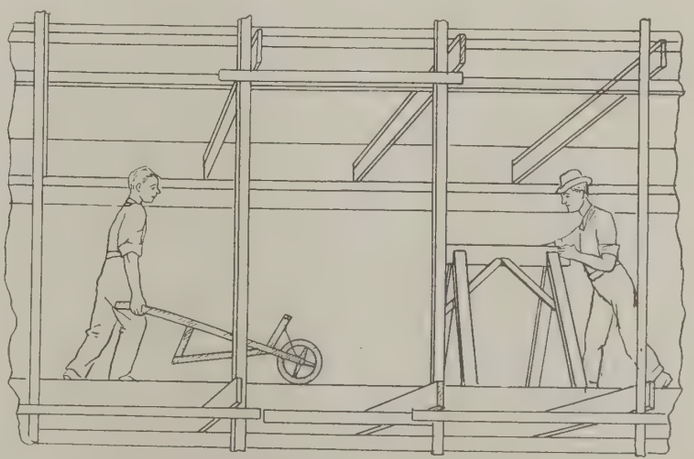
SCAFFOLDING.

Let me here dwell for a moment on the value of a knot Fig. 4, and readers will see that to be safe, and to be able to work



IRON WALL BRACKET FOR PAINTERS AND DECORATORS.

WOODEN WALL BRACKET FOR CARPENTERS, PAINTERS AND DECORATORS



easily and without danger—each man must make his knot properly and thoroughly on either end of the scaffold platform lest it may drop and the mechanic be precipitated to the ground below. And

FOLDING SHINGLING BRACKET.

then how is this knot to be made?

It is simple enough, but must be sure. So many things are so simple and not always sure. A simple half hitch turned over the hook and it will hold, but hempen ropes are unreliable in wet weather and should be knotted with an 8-knot or a timber hitch.

The remaining illustrations show the best forms of scaffolds for modern work.

As under each caption and figure their value is explained, I do not deem them worthy of extensive description. Suffice that they are valuable and necessary are easily within the scope of the construction of the practical builder.

In connection with the swinging scaffold subject, I might state that there are in present use many forms of patented kinds, some being hung with wire ropes, and some by steel rods butted together. The former are hung from projected I beams, set on the roof tier of beams of the steel frame of the building. The cables are lowered or raised by means of endless chains as ropes working on a screw and pawl set on the beams. I regret that the inventors will not allow the publication of their designs, so readers must perforce use their own observation in the cities where these scaffolds are in daily use on high building construction.

Finally, as there is dependent so much on safe scaffolding and successful building, I would conclude this article by saying, "Surely the whole splendid cause of building construction has numbered enough martyrs, and surely it is not too much to ask that all scaffoldings should be safe, in order that craftsmen, artisans and laborers can execute their work with a sense of security and profit.

If this article can draw the attention of the building community in this direction. I shall have reason to be thankful.

ADVICE TO ASPIRING CONTRACTORS

By CHAS. ANDERSON

AS another springtime approaches with all indications of another record year for builders, there will no doubt be a large number of journeymen carpenters and other building tradesmen making their initial step as contractors. In the writer's opinion there could be no more opportune time to offer a few words of advice.

It is not my purpose to try to discourage any, but it is an undeniable fact that probably not more than 10 per cent of those who start into business succeed from the first. Some fail once and succeed on the second attempt; while a great many of the most prosperous business men of today have failed three times before they have succeeded.

It would seem that many must learn from actual experience how to overcome the many snares that lie in the path of the business man before they are able to steer around the dangerous shoals that cause wrecks.

The late P. T. Barnum once said that a man must fail three times before he knew how to succeed. The writer believes that business is being reduced more and more to a science year after year, therefore a great many business disasters could be averted if the inexperienced man would profit more by the advice of others who have made a success, instead of relying so much on his own individual judgment.

CONTRACTING VS. OTHER BUSINESS.

The contracting business is one of those peculiar undertakings that require very careful and judicious management; it is unlike almost any other business.

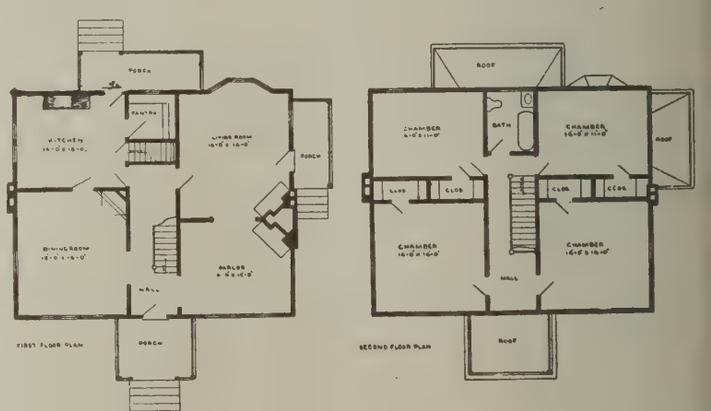
The merchant has his business concentrated in one place where he can watch it, while with the contractor his work is scattered, a job here, another there, etc. It is impossible for a man to be everywhere at the same time, he therefore is compelled to trust largely to hired help. There are a great many leak holes where the profits may be lost that the inexperienced contractor may never think of until too late. Perhaps one of the largest leaks is the loss of materials (stolen from the work). The writer knows of a case in an eastern city where a builder was erecting a row of dwellings recently who lost something like $1,000 worth of materials in this way, and finally was compelled to put on a night watchman. This is getting to be an item that the contractor must take into consideration when making his estimates. There is so much material that cannot be placed under lock and key, and many people seem to think that a few boards, a 2x4 inch, a bundle of lath or shingles, will never be missed from a large pile. Needless to say, many a contractor's profits are badly cut into in this way.

THE BUSINESS END.

There are many A-1 mechanics who make the mistake of thinking that their mechanical ability will carry them through. This is, indeed, a serious blunder; some of the best mechanics have made the greatest failures. Unless you have a fair knowledge of business tactics the writer would advise leaving contracting alone until you first take up a commercial course. In fact, the business end is the more essential of the two; you can hire good mechanics, but it is very difficult to hire the business head that will work to your interest. Business systems for contractors will be made the subject of a future article, as space does not permit dealing with it here.

SOME COMMON ERRORS MADE.

First, many take there first contract too cheap in order to get started, and never do the second.



Second, some take too much work; more than they can properly attend to or perhaps finance. It must be remembered that there is more profit to be made out of one job well managed than out of two jobs neglected; it is not always the man with the most work on hand, employing the largest crew, that is making the most money.

When you have more work than you can take care of properly you cannot give satisfaction to your customers. (A satisfied customer is your best ad.) Do not try to get every job in sight in order to look big.

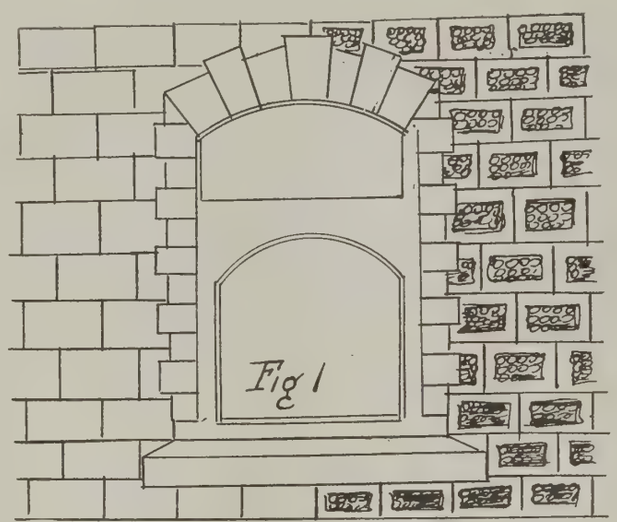
Third, improper and inexplicit plans and specifications are the cause of many failures; with such you are often called upon to do more than you figured on doing. Know exactly what you must do before you sign a contract; it is not wise to be too exacting in small matters, but many beginners are overzealous to please and allow themselves to be imposed upon. Diplomacy used in the right manner will usually let you out of such positions without causing friction. The contractor must always carry himself cool and collected; consider well before you act or speak.

Fourth, the purchasing of supplies, estimating, handling the prospective builder, handling help, etc., are very important considerations that will be dealt with later.

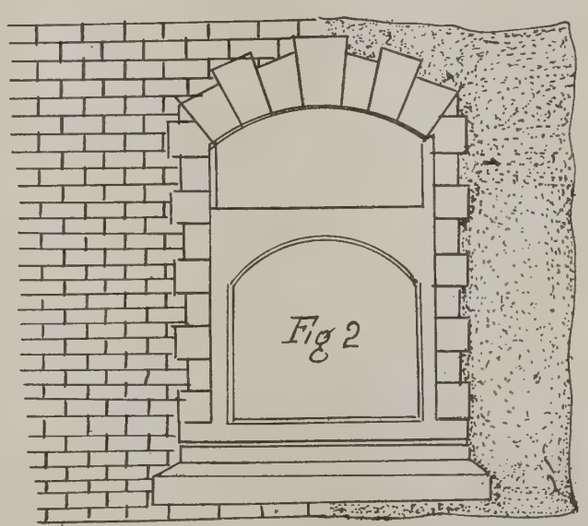
(To be continued.)

HOUSE OF MODERATE COST.

A HANDSOME PILE OF BRICKWORK.



A BRICK BUNGALOW ON THE IRISH COAST.



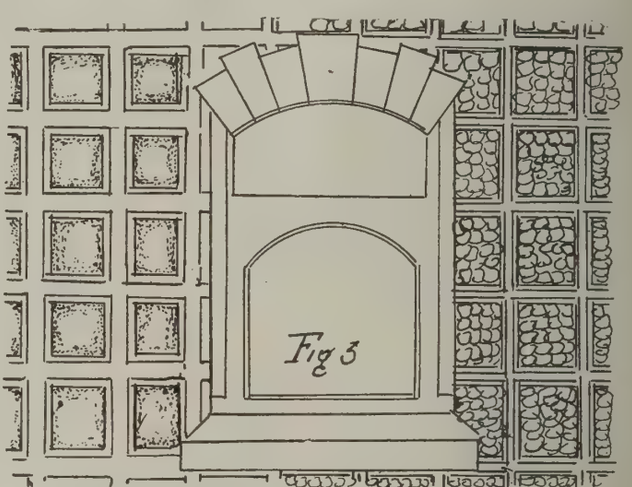
CASEMENT WINDOWS AND CEMENT BLOCKS

By GEORGE RICE

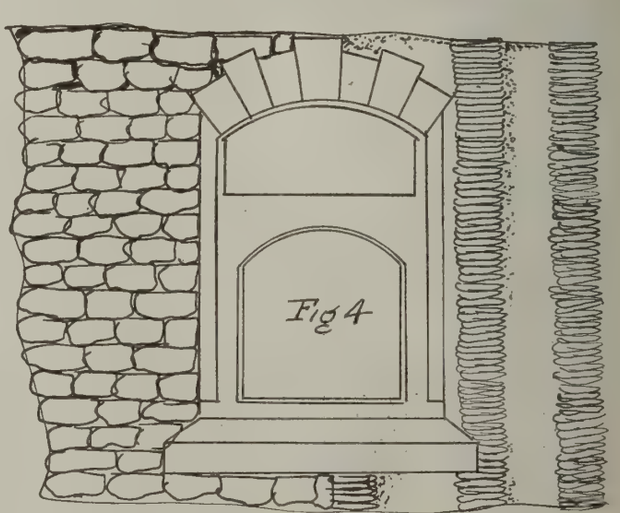
THE accompanying drawings were made from models of casement windows and cement blocks seen by the writer. The elevations are of the common type of mullion casement window with sash and fixed transom. In Fig. 1 the sash is set up in random coursed stone, on the exterior of which are the patterns of cement blocks. Each figure shows two styles of settings, one style on either side.

In some cases roughly squared ashlar is used in the frame. Dressed stone jams are required and a sill and segmental arch. But it is mainly of the cement wall we write in this article. There has been considerable progress in this line of work in all parts of the country in the past few years, as is well known to builders and contractors. Nearly all of the firms are obliged to put in apparatus for working with the stones of cement.

The draughting rooms of the architects are full of plans with hollow blocks as the center about which the work of building hinges. Wherever the writer visited he was confronted with plans of which the architects and builders are going to do with the ever-increasing designs of hollow blocks made from cement. Therefore in many of the offices I noticed sketches drawn up with various types of hollow block architecture as a part of the plan, as in the accompanying illustrations. One of the schemes for showing the effect of the cement block combination consists in erecting the casements in small size and building with the blocks, as in the cuts.



It is very easy to handle the little model blocks. Some very unique designs of architecture can be worked out in the office and the table of the architect. In one place they showed me a mill with very artistically patterned windows, set in hollow block designs.



Undoubtedly the era of design in the hollow cement block is at hand. While the plain blocks are almost always preferable from a building standpoint, no harm is done in having the face of the blocks indented with floral or figure design, providing that the designs do not sink too deeply into the body of the stone. I saw some very much weakened blocks in one model of a building, due to the impressions and indentures which were necessary in order to model the figures on the front of the blocks. But for the common pattern which is used on blocks, no material weakness results. In the cut in question the blocks on one side of the casement are entirely smooth. The smooth block is always popular.

The users of hollow blocks select the smooth, firm, plain surfaces much oftener than they choose the patterned blocks. However, there are some builders who demand the face blocks with various impressions and figures defined thereon. The style of face blocks shown on the right side of the cut are in good demand.

Then there are some builders who require blocks finished off in representation of ordinary bricks. Just why anyone should demand a pattern of this nature is not known. But the makers of concrete blocks tell me that there are often calls for this class of work, a sample of which is shown at the left side of the sample in figure 2.

In the construction of the blocks with brick lines defined on them, the operation is the same as in the making of the smooth-faced blocks, except that the brick lines are impressed therein by the employment of the necessary risings at proper intervals on the face side of the mould. Occasionally you will find instances of hollow brick made and finished on the pattern of the hollow cement block, and the size no larger than the ordinary clay brick. Then there are people who want the smooth, speckled surface way across the front, such as is shown in Fig. 2 at the right. I have seen this requirement carried to the extreme of plastering over the

entire finished surface, so as to present a new and entirely smooth surface for the wall. The concrete block makers have introduced some blocks which can be set up with almost invisible lines, thereby creating what is apparently a solid front. But the lines at the juncture almost always reveal themselves in time. Therefore in order to fill the requirements of the odd taste of some folks, the contractors are obliged to go over the wall with a thickness of cement. This surface is then worked to make the proper concrete face representation. Another style of block is exhibited at the left side of the diagram No. 3. This is one of the styles in which the block is edged, and these smooth edges fit snugly, forming the effect as shown.

In recent years there has been quite a demand for a mottled style of block. There are calls for cement blocks set with broken bottle glass, and some set with stones, as at the right in Fig. 3.

I find that the manufacturers of concrete blocks do not encourage these odd schemes. The manufacturers believe in the simple, substantial, practicable grey block, properly finished for building purposes. But the manufacturers cannot have it all their own way. They are often called upon to make blocks with peculiar finish and form. Hence the pebble block may be seen in service as well as the block which requires some of the workmen of the plant to go to the junk shops and get old bottles. These old bottles are broken and the broken material is adjusted by hand in the soft block when the latter is first made. The workmen cut their hands and are otherwise annoyed.

Then there comes the man who orders concrete blocks made for his building in representation of common stones, as at the left side of Fig. 4. This is not by any means an exceptional order. Some of the concrete block makers refuse these bothersome orders on the plea that they are too busy with regular work, or that they do not have the proper moulds for shaping the odd patterns. Other manufacturers, desiring to build up their business and to accommodate, undertake the work, although there may be little money in the job. The new moulds have to be made, and this costs money and consumes time. However, from what I could learn by calling at a number of concrete block works, the majority of proprietors were willing to furnish whatever styles of blocks they could make, even though the margin of profit might not be large. As a whole the profits run high and are liberal. The cement block maker, whether he is turning out the regular run of blocks or special patterns, can always depend upon good prices and fair profits.

MILL CONSTRUCTION

By WARFIELD WEBB

MILL and factory construction, as well as residences and office structures, demand a material that will withstand the test of severe flames. There are several materials that will add to the possibility of this hope, and there is a more notable advance in this direction of late than has been noted in the past. While the subject of fireproof factory construction can become a matter of importance to every industry, naturally that of combustible materials, or materials that are easily consumed, should demand the most imperative consideration. Not alone does this demand apply to owners, but to contractors as well, and they should see to it that the matter is given a clearer understanding and more intelligent co-operation by both owner and builder.

The admirable qualities of concrete, for instance, are being generally appreciated for the building of many kinds of plants. For the manufacture of lumber, wood working specials, fabrics, and kindred lines, as well as for combustible materials, find in concrete a most desirable structural material. If we consider the immense losses each year from destruction by fire of such plants, it will bring quite forcibly to our minds the need for the adoption of some structural material that will prevent the onslaught of the flames. Aside from the danger, which is often immiment, from loss by fire in such plants, the increase in the hazard, making insurance difficult and well nigh prohibitive to obtain, only by paying the most exhorbitant rates.

The danger then, that a mill or factory operator incurs where the building is of frame or poor construction is a matter for his serious consideration. As is often the case these plants are isolated, and the protection that would otherwise be accorded them is impossible to obtain. The matter then assumes one of grave import for the owner, and is one that must not be overlooked by the builder.

There is a more careful inspection into this matter and it is becoming more properly understood and appreciated by a larger percentage of operators. For various reasons, primarily their unbelief in concrete, their hesitation to use other materials than those with which they have long been accustomed; the cost, which they believe would be far too great to permit of its adoption—it can be said that these are at least a few of the reasons why concrete has failed to impress itself upon the average factory man as it might have done in the past.

It is not saying too much to admit the fact that for ordinary factory construction concrete has been found a very admirable material. This includes its several forms, reinforced, brick and block. The one item of fire protection is of such importance that there should be no hesitation on the part of any one who operates a plant of the above description to look at it in this light. We recall an instance of where a frame factory building was consumed by fire that was very near the city limits, and still too far to be reached to any advantage by the fire department. The result was a total loss and complete destruction, simply from a lack of water being supplied to extinguish the flames. A concrete structure under like circumstances, would have withstood the flames, and the loss, at most would have been trivial. The outcome was that the company realizing its loss did not rebuild the plant.

As a contrasting incident to this there has recently been completed a large lumber manufacturing plant that is removed far from the city, and that would have no possible chance of escape from destruction, should fire start therein. However, to obviate this the company builded it of concrete, and is safe in feeling a relief from this danger. This is cited to show the forethought on the part of the owners, and as this happens to be a large lumber manufacturing company, it might seem a trifle strange that they would adopt this form of construction.

The fact that lumber is scarcer and naturally more costly than it was several years ago, is only another argument in favor of the erection of factories with some form of material other than wood. Durability is a vital consideration in this connection, and there should be more concern given the matter of permanency by manufacturing concerns. There is a saving too, in the concrete structure over a few years ago. Improvement in methods of construction, reduced cost of materials, and a greater knowledge about the industry have been factors that mean much to the prospective builder.

Contractors are giving more consideration to concrete as a structural material. So many builders, of all classes, are now being erected with concrete, either as a whole or in part, that it becomes a matter of more than passing interest to give concern to every progressive builder.

If we consider the matter of sanitation in the construction of many plants to-day, which becomes a vital factor, there is much to be found in favor of concrete. If there is to be heavy machinery installed the foundation and floor will assist in making the structure more durable, and the danger of damage to equipment in this respect less liable. These and many other points are of enough importance to interest every contractor, and are points that he can use in favor of mill construction of concrete. With more factories constructed in this way there will be fewer losses from fire, and a reduction in the insurance rates, two factors that are worthy to be borne in mind. With the fire danger reduced we will insure greater permanency to our buildings, and in other ways reduce the losses that have become so enormous in this country, and that must increase unless the proper remedy has been found and adopted to prevent them.

Seen and Heard on Long Island

A teacher tells me that at a Brooklyn school, not long since, the class in geography was asked: "What are some of the natural peculiarities of Long Island?" The pupils tried to think, and after a while a boy raised his hand. "I know," said he. "Well, what are they?" asked the teacher. "Why," said the boy, with a triumphant look, "on the south side you can see the sea, and on the north side you hear the sound."—Spare Moments.

NOTES ON BRICKWORK

WHERE possible every brick in the footings of a wall should be laid a header. The reason of this will be clear on a little consideration. The bricks laid in the outer course of footings, if put in stretchers, only lap in the wall two inches and there is a great tendency for them to become displaced, as indicated by Fig. 1. Where, however, they are laid headers, three-fourths of their length is bound into the wall, and they can scarcely fail, except it be by reason of the bricks themselves splitting into pieces. The general form recommended for footings is that shown in Fig. 2, and the arrangement will produce as strong footings as can be had. In the case of very heavy buildings the tendency of the brick to break may be overcome by building in two courses at the bottom, which is the weakest point.

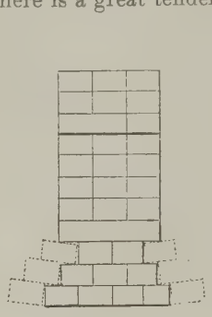


FIG. 1. DISPLACED BRICK.

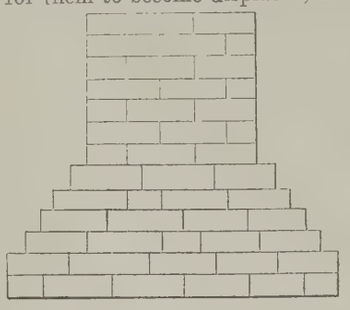

FIG. 2. FOOTINGS FOR HEAVY WALLS.

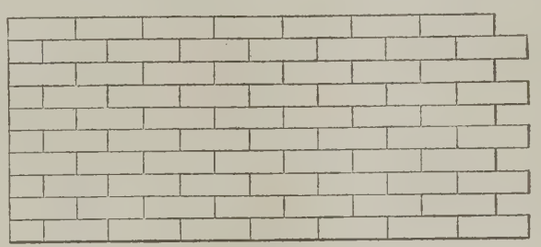

FIG. 3.

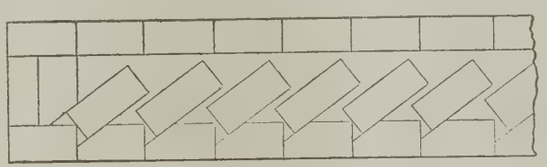

FIG. 4.

The diagrams, Figs. 3, 4 and 5, show the plans and elevations of an external wall in running bond. Fig. 4 shows plan or wall having diagonal bond. This style of bonding makes a very strong wall and is often used in front walls, particularly when the walls are faced with pressed bricks, or with stone or marble slabs—or tiles. Sometimes this bond, like the bond consisting of five, or less, courses of stretchers and one of headers, is called, wrongly, "American bond." It was used long before America was discovered, in Germany, England, Holland and Spain.

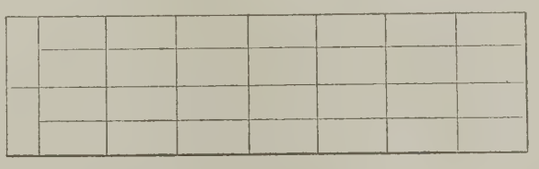

FIG. 5.

FINISHING HARDWOOD FLOORS

The efficiency of the hardwood floor depends very greatly on the character of its finish. Here are some suggestions for finishing oak, maple, and other hardwood floors, which will prove of service to the builder.

Oak floors require a filler, if good, smooth finish is desired in the natural, no matter what material is used. Maple does not require filling. For oak floors a good mineral paste filler and two light coats of grain-alcohol shellac varnish, or, in place of the latter, waxing often with a good floor wax will keep the floor from darkening.

AN ORDER OF INDUSTRIAL MERIT

"Fifty per cent of the accidents to American life and labor are preventable," according to an official of the American Museum of Safety, "and it proposes to show how this can be done, through its permanent exposition of safety devices in New York City."

At the exercises in connection with the formal opening of the new museum two gold medals offered by the Travelers Insurance Company and the Scientific American to the individual industrialist or corporation that has done the most for the safe-guarding of its machines and processes, and for the best safety device exhibited at the Museum, respectively, will be awarded by the trustees of the Museum, November 21, at the Engineering Societies' Building.

Among the exhibits already received are a series showing the work of the factory Safety Engineer and the Safety committees, another idea of the new thought in conserving human life, by establishing in the up-to-date plant an official whose sole work is the promotion of safety.

WHITE OAK VERY SCARCE

The so-called white oak timber of our markets is often a mixture, not only of various species of the white oak group, but also of other species, such as the red oak. This generally unknown fact is reported by the Department of Agriculture, which, as a part of its forestry work is often called upon to pass judgment upon the identity of market woods in dispute.

Foresters divide all the oaks into two distinct groups, the white oak group, and the black oak group. The black oak requires two years to mature its acorns, and the white oaks but one year. The woods of the two groups are structurally different. In the early days of its abundance, market white oak was derived almost entirely from Queros Alba, the true white oak. This species combines the utmost strength and toughness of any of the timber oaks. The immense inroads made upon what were regarded as the inexhaustible white oak forests, which stretched from the Atlantic seaboard to Missouri, gradually so reduced the supply that the use of other species became inevitable.

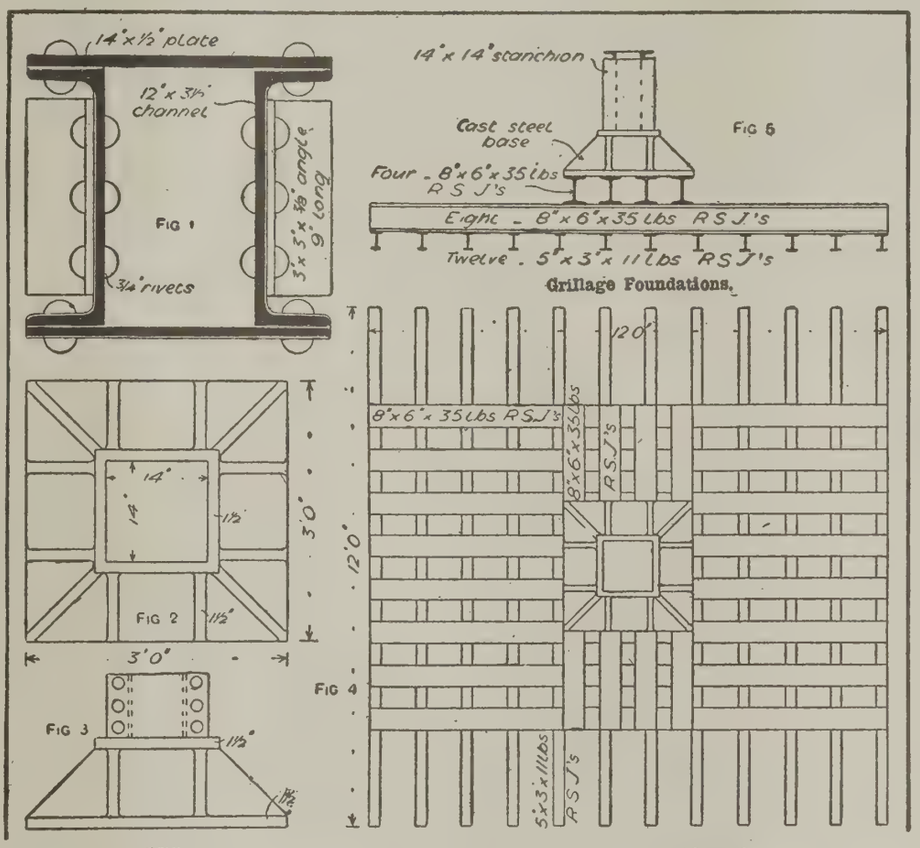
It is almost impossible, at the present time, to obtain a consignment of white oak that does not contain pieces of some other species. The species most used, in addition to the true white oak, are burr oak, chestnut oak, chinquapin oak, post oak, swamp white oak, cow oak, and overcup oak. Real white oak timber of No. 1 quality is usually cut into quarter-sawed boards, while a combination of one or more white oak and red oaks may constitute other cuts of "white oak." In many markets the term "cabinet white oak" is now understood to include a mixture of white oak and red oak, while it often signifies red oak only.

The Department of Agriculture affirms that, for the ordinary purposes for which true white oak is used, practically all the trees of the group yield woods that can be interchanged, and will serve equally well.

FIRST AID FOR THE INJURED

A large woodworking factory should have a special room set aside for the purpose of rapidly rendering assistance to employes who have sustained serious injury from the machinery installed in the workshops. Guards of all kinds have been devised, it is true, but still the risk with circular saws and cutters, revolving at a high speed, is very considerable. In these days of compensation it is in the interest of the employer to use every endeavor to prevent complications arising from a wound which may lead to a prolonged absence from work. Among two or three hundred workers someone is frequently getting injured, no matter how careful they may be nor what precautions are taken to ward off danger by means of safeguards and warnings.

The first-aid appliance need not be costly, but should be kept in a dust-proof cabinet or cupboard. The modern surgeon insists above all things on cleanliness, and before a cut is bandaged it should be thoroughly cleansed, and so it stands to reason that all the appliances should be spotless and aseptic.



Splints, bandages, restoratives and glass bowls, with warm water for washing cuts or wounds, are essential, and there should be telephonic communication with the nearest medical man or club doctor.

There are times when the ability to stop a flow of blood by pressure on the artery may save a fellow-worker from succumbing from loss of blood before medical aid arrives.

CONSTRUCTION OF GRILLAGE FOUNDATIONS

A CORRESPONDENT, living in a large city, wishes to know what is meant by grillage foundations and asks us for a sketch and description of such that would carry about one and a quarter tons to the square foot. We reproduce the following, which is from a paper prepared by Mr. H. Adams, C. E., which we think covers the ground:

Grillage foundations are composed of rolled steel joists laid side by side under the base of a stanchion and resting upon another layer of rolled joists extending wider, and so on until the pressure per unit of area is reduced to that which the soil is capable of bearing safely. The joists are usually embedded in cement concrete. And the matter is of sufficient importance to readers of NATIONAL BUILDER to give a full answer. In designing a grillage foundation commences with the load to be carried and the safe pressure upon the earth. In this case the load is 175 tons, and the safe pressure

1.25 tons per superficial foot, then $\frac{175}{1.25} = 140$ sq. ft. area required at base of foundation, and $\sqrt{140} = 11.83$, say 12 ft. width of side, with twelve rolled-steel joists. The stanchion will be approximately as Fig. 1, composed of two 12-in. by 3½-in. by 32-lb. channels, and two 14-in. by ½-in. plates, with ¾-in. rivets, 4-in. pitch. The sectional area will be about 33 sq. in. and the stress $\frac{175}{33} = 5.3$ tons per square inch. The base may be built up of plate, gussets, and angles as for resting on stone or concrete, but a more usual method is to put a cast-steel base under the stanchion, as in plan (Fig. 2) and section (Fig. 3), allowing, say, 20 tons per square foot. $\frac{175}{20} = 8.75$, $\sqrt{8.75} =$ say 3-ft. side of cast-steel base. Placing the first layer of joists at 9-in. centers, there will be four required in the top row, projecting midway from the steel base to the outside of foundation, giving a length of $\frac{12-3}{2} + 3 = 7.5$ ft. The number of joists in the middle layer $= \frac{4+12}{2} = 8$. Then the plan of the foundation will be as Fig. 4, and section as Fig. 5. The next step will be to calculate the size of the rolled joists. Beginning with the lower ones, the distributed load pressing upwards is 1.25 tons per square foot, the joists twelve in number, their overhang $\frac{12-7.5}{2} = 2.25$ ft., so that they must be calculated as cantilevers under a distributed load, the maximum bending moment being $\frac{wl^2}{2} = \frac{1.25 \times 2.25^2}{2} = 3.164$ ton-ft. Then the equivalent distributed load on a beam supported at the ends would be found from $\frac{W\ L}{8} = 3.164$, whence $W\ L = 8 \times 3.164 = 25.312$, which is the load in tons 1 ft. would carry. Referring to tables, a B.S.B. 6, 5-in. by 3-in. by 11-lb. joist is found to be sufficient. Taking the middle layer, there are eight joists covering a width of 7.5 ft., say 12-in. center to center. Their projection will be $\frac{12-3}{2} = 4.5$ ft., and the load they will have to bear $4.5 \times 12 \times 1.25 = 67.5$ tons, or $\frac{67.5}{8} = 8.44$, say 8.5 tons each. Then, as before, $\frac{wl^2}{2}$ or $\frac{W\ L}{2} = \frac{8.5 \times 4.5}{2} = 19.125$ ton-ft. Then for an equivalent distributed load over a beam supported at the ends, $W\ L = 8 \times 19.125 = 153$, which is the load in tons 1 ft. should carry. Referring to the tables, it will be found that this value is given very nearly by a B.S.B. 14, 8-in. by 6-in. by 35-lb. joist. Next for the top layer, the projection is $\frac{7.5-3}{2} =$ 2.25 ft., and the load the joists have to bear will be 175 tons $= \frac{175}{4} = 44$ tons each on the length of 7 ft. 6 in. $= \frac{44}{7.5} =$ say 6 tons per ft. run $= 6 \times 2.25 = 13.5$ tons on the projecting portion. Then $\frac{W\ L}{2} = \frac{13.5 \times 2.25}{2} = 15.2$ ton-ft., and equivalent distributed load on beam supported at ends $W\ L = 8 \times 15.2 = 121.6$, which is the load in tons 1 ft. would carry, requiring a B.S.B. 14, 8-in. by 6-in, by 35-lb. joist as before. The joists would be bedded in 1:3:6 concrete to enable them to spread the pressure properly, and also for their protection against corrosion.

FRAMING THE RUSSEL HOUSE ROOF

By WM. C. A. STEVENSON

THE roof of the Russel House, published in this month's supplement, is perhaps the best example lesson in roof framing that we have published for a long time, there being only four common rafters in the main roof; it is made up of hips, valleys, jacks and cripples. Many mechanics who consider themselves good roof framers would find that this roof would start the wheels in their head working overtime.

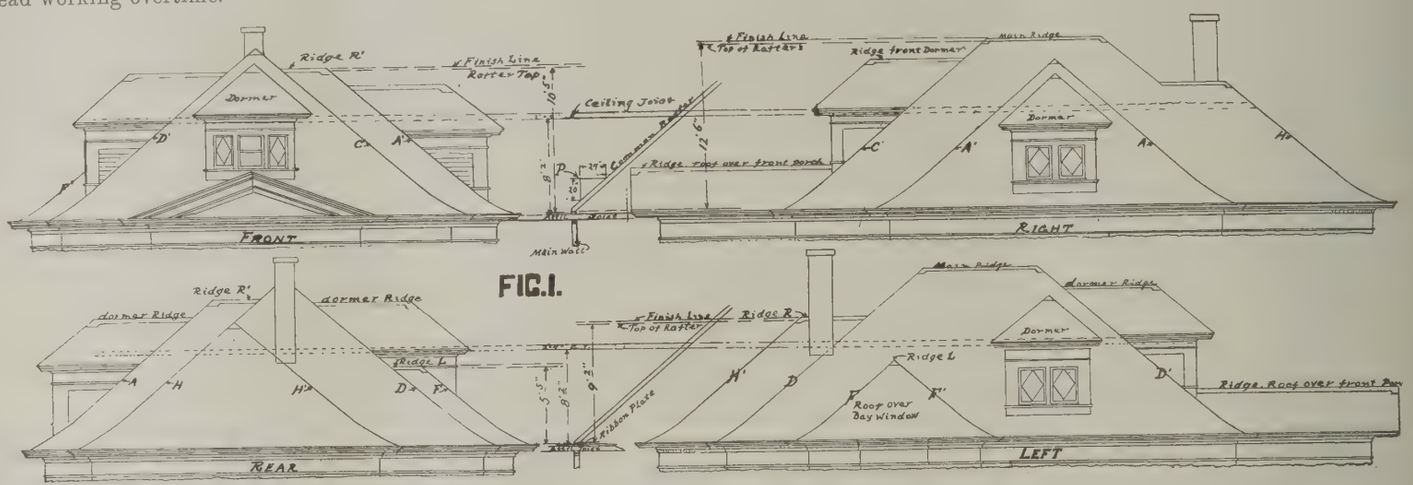


FIG. 1.

To explain this roof fully, illustrating every part, would take up more space than can be given to it here. I have, however, been as explicit as possible in the limited space allotted to it, so that the workman with any knowledge of roof framing at all will be able to understand.

For the benefit of the inexperienced, I will here define the five different rafters used in roof framing.

The Common: The straight, plain rafters running from the plate to the ridge.

The Hip: The rafter running diagonal from an external angle of the plan and forming an external angle of two sides of the roof.

The Valley: The rafter running diagonal from an internal angle of the plan and forming an internal angle of two sides of the roof.

Jacks: The rafters running from the plates and cutting against the hip.

The Cripples: The rafters cutting between hips and valleys, or valley to ridge.

Fig. 1 shows the four elevations of the roof lettered to correspond to the same pieces on the plan Fig. 2. (The valleys cannot be seen in the elevations.)

It will be seen at Fig. 1 that the pitch of this roof is 10 inch rise to the foot run (except the roof over the front porch, which is 5 inch rise to the foot run); the common run at the widest is seen to be 15 feet, half of 30 feet, the main ridge is therefore 15x10= 150 inches = 12 feet 6 inches high above the plates. Ridge R' is 25 feet ÷ 2 = 12 feet 6 inches x 10 = 125 inches = 10 feet 5 inches high above plates. Ridge R is 22 feet ÷ 2 = 11 feet 0 inches x 10 = 110 inches = 9 feet 2 inches high above plates. Ridge L is 13 feet ÷ 2 = 6 feet 6 inches x 10 = 65 inches = 5 feet 5 inches high above plates. (See dimensions given on Fig. 1.)

Before we take up the question of finding the lengths of bevels and cuts we will discuss the best method to frame this roof and where to begin, as this is where not a few find difficulty? If the reader will now look at Fig. 2 I will try to explain what I deem the best and most practical method.

The hip rafters marker D-D' and C' I would raise first, putting in the main ridge, which would require a temporary shore under it where D meets it, to hold it up until valley B and a few cripples are in place. Note.—Valley B is extended up to the main ridge as shown by the dotted lines, valley B' cutting to it at the intersection of ridge R, which is just 2 feet 1 inch on the level below the main ridge. Next raise hips H-H' and valley G, then the short hip C, and a few cripples from valley B to ridge R. The roof will now be self-supporting; the balance may be erected as desired.

In framing in the dormers cut a trimmer between the rafters marked s, which should be doubled, allowing the rafters in the main roof to extend down to this trimmer as shown by the dotted lines; the main roof is then boarded over and the dormer roof allowed to die onto it, thus forming the valleys for the dormers without cutting a valley rafter in, the framing of the dormer hips, etc., is the same principle of the main roof.

The same plan may be followed for the valleys E-E' over the bay-window, by running the ribbon plate through as the dotted lines show. Valleys I-I' are formed likewise.

It will be seen by the detail of the cornice on the supplement, that the cornice projection is formed by planting the rafter tails on top of the main rafters, thereby forming the bell-cove seen in the roof at the eaves, therefore, in cutting the rafters, we only require to cut them flush with the main wall plates.

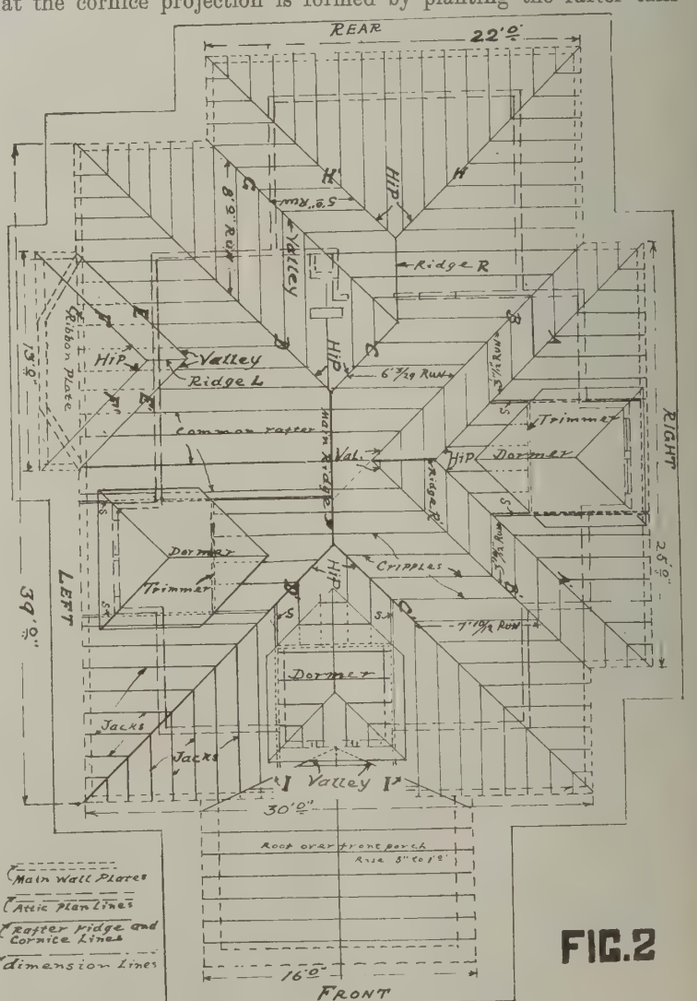

FIG. 2

At Fig. 3 is illustrated how to find the lengths of the various rafters with the square. Note.—The use of the side of the square graduated to twelfths. This enables us to work to a 1/12-scale, an inch representing a foot, and a twelfth an inch.

As the pitch of this roof is 10 inches to the foot run, to find the length of the common rafter we measure across the diagonal of the square from 12 on the blade to 10 on the tongue, which is seen to be 15 8/12-inch, the length of the common s, jacks and cripples, to each foot of run, the figures 12 giving us the foot or seat cut, and 10 the plumb cut. The jacks have a cheek cut also, where they fit to the hips, the cripples having a cheek cut at both ends to fit both hips and valleys, except when the one end extends to the ridge; then there is only a cheek cut at one end. (The method of finding cheek cuts was described in the December number. It will therefore not be necessary to take that up here, as the reader can refer to it.)

The first jack set 20 inches from the corner would also have a run of 20 inches = 1 2/3 feet, multiplied by 15 8/12 inches = 26 2/12 inches long; spacing them at 16 inch centers each one would therefore have 16 inches more run than the preceding one. Sixteen inches is 1 1/3 feet multiplied by 15 8/12 inches = 20 11/12 inches longer. (Each jack is therefore 20 11/12 inches longer than the last.)

The cripples in each run between hip and valleys would all be the same length. Example: To find the length of the cripples from valley B′ to hip C′ the run is seen to be 7 feet 10/12 inches x 15 8/12 inches = 111 8/12 inches = 9 feet 3 8/12 inches length on top edge—long to short point. The others can be found in like manner by multiplying the run as marked by 15 8/12 inches.

In order to find the length of a hip or valley the run must first be known, which is the diagonal of the square of the common run. Example: Fig. 2 shows the common run to the main ridge to be 15 feet 0 inches; therefore, to get the run of hips D-D′ and C′ we measure the diagonal of the square from 15 inches to 15 inches as at Fig. 3, and we find it measures 21 3/12 inches, the run for these rafters, and also the valley B as it extends to the main ridge.

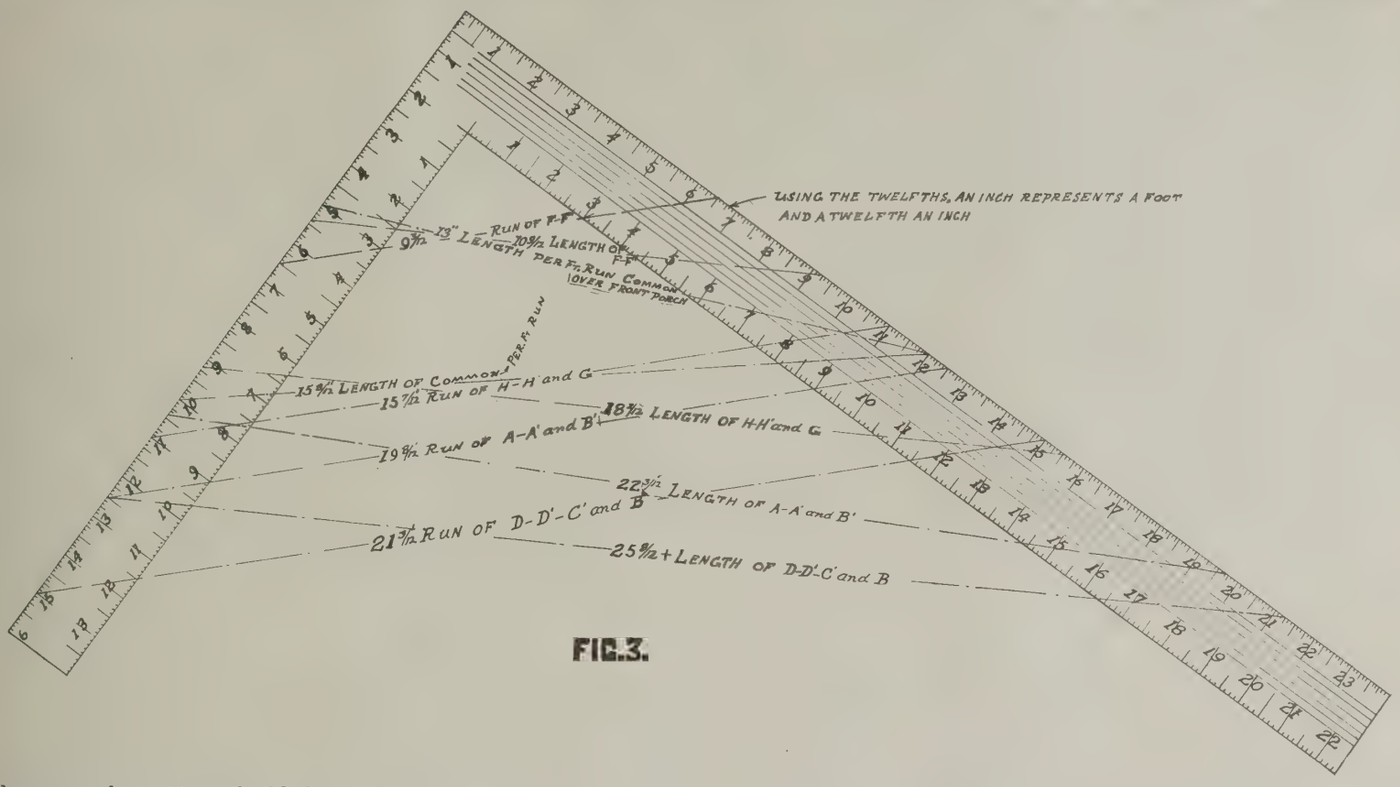

FIG. 3.

As before found, the main ridge is 12 feet 6 inches high above the plates, this will be the rise and 21 3/12 inches the run on the square, which shows us that these rafters are 25 8/12 inches = 25 feet 8 inches long.

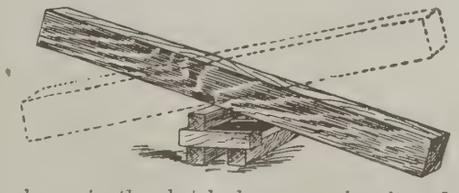
Further explanation ought not to be necessary, as the diagrams show clearly how they may be found.

I have not made any allowance for the ridge boards, hips and valleys in calculating the lengths, having worked to the centers in each case; the workman would therefore require to allow for the wood taken up with these in cutting the rafters and cut them that much shorter. Thus, jacks would require to be cut half the thickness of the hips shorter; the commons half the thickness of the ridge; the cripples half the thickness of the valley at one end, and half the thickness of the hip at the other end.

The roof over the front porch is simply a common rafter roof, rising 5 inches to the foot run, which is seen to be 13 inches long to each foot run.

COST OF SAND-LIME BRICK

The following information shows the cost of producing sand-lime brick in a single unit factory, capacity up to 20,000 brick of standard size, per day of 10 hours:



1 foreman.
1 engineer (to do his own firing).
1 engineer (night watchman).
8 common laborers.
2½ tons lime.
3 tons steam coal or equivalent.
Oils, waste, $2.00.
Repairs, wear and tear, $5.00.
Total for 20 M. brick.

Expense for management, insurance and incidentals are to be added.

If the sand has to be shipped in, add the cost of two cubic yards for each thousand brick.

RAISING A HEAVY TIMBER WITHOUT TACKLE

A heavy stick of green timber 12 inches by 14 inches and 48 feet long was raised to a height of 7 feet 6 inches in fifteen minutes without the use of tackle, and one assistant. The timber was

raised as is shown in the sketch, by see-sawing it and building up a crib of blocks beneath it. Each time one end of the timber went up a new block was placed, the work proceeding in this manner until the desired height was attained.—The Operative Miller.

STEEL A SUBSTITUTE FOR WOOD BEAMS

By S. VAN RAALTE

THE BEST modern practice, and the demands of municipal building laws, compel the use of fireproof beams for the support of all masonry walls, over openings of large span. While the calculation of these is more in the province of the architect and engineer, it often happens especially in alteration work, that our versatile friend, the contractor, finds he has it to do.

There are many methods of calculation more or less complicated, for steel beams supporting walls, floors, roofs, etc., all involving the use of a standard handbook, which comparatively few of us possess. Even if we do, and are not familiar with the use of it, we have a tedious problem with several liabilities of error.

The table in this article gives in the heading of each part the size of a beam, white pine or hard pine as the case may be. The left hand column gives the various spans, the next column being the maximum distributed load that the wood beam can carry, and not deflect or sag down more than one thirtieth of an inch for every foot of span.

The third column gives the depth and weight per lineal foot of the I beam which will safely carry the same load as the wood beam, and deflect no more than it. The fourth column gives us the same data but it deals with channel beams.

The fifth column gives the depth and weight per lineal foot of each of two I beams that will together safely carry the load with the same restrictions as before, and the last column gives the same particulars of each of two channels.

24	10056	12-in.@31.5 pounds	15-in.@33 pounds	9-in.@21 pounds	12-in.@20.5 pounds

The application of the table is direct, if the size of the wood beam is known, as it would be, if we were taking out an old beam and substituting a steel one for it, but there is a factor that must be kept in mind. It is this, steel beams are inclined to twist sideways when used for long spans and fully loaded. The usual handbook rule is that beams shall be braced against twisting, at spaces of 20 times their flange width or the load shall be reduced accordingly. In our table the loading has been cut down considerably in order that the vertical deflection shall not exceed one-thirtieth of an inch per foot of span, so the bracing against sideways distortion can be safely spaced at distances of thirty times the flange width.

From this it can be easily seen that each of the four arrangements of beams have more or less advantages over the others, or perhaps it might be better stated that each style of beam is best adapted for a particular purpose.

For supporting a wall load two I beams, or two channels used with cast iron separators between, form probably the safest and most convenient beam. In these, separators as shown in figure 1 should be spaced at distances of 30 times the flange width of a single beam, in order that the two may act together. The usual pipe separators should not be used unless the interior space is filled with concrete, or masonry.

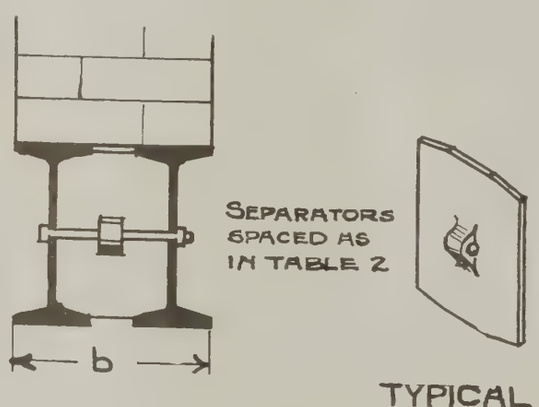

FIG. 1.

For the sideways distortion or twisting, the width out to out of the assembled beam may be considered as the flange width. By spacing the beams a sufficient distance apart any exterior bracing becomes unnecessary. In cases where either a double or single beam is used as a lintel, if the wall is anchored by the joists three feet or less above the top of the lintel, the twisting of the beam may be disregarded.

The I beam used singly is usually the most convenient support for roof and floor joists, and where the joists abut the web on both sides, the beam may be reckoned safe from twisting. If they simply rest on the top flange, some kind of clip must be used at the 30 times flange width spacing. This clip need only grip the top of the beam, and if it is not furred and cased, can be made so small that the ceiling plaster or boards will cover it.

Where the joists are on only one side, a clip must be devised to hold the top flange of the beam, and this is also good where a beam supports a wall and has the joists on one side only.

The channel used singly is best adapted for the support of floor joists against a wll, but it can be utilized for the same purposes as an I beam, keeping always in mind that it is narrower and must be braced against sideways distortion.

Summing up it can be generally said that a double beam should be used to support masonry, and the single beams to carry floor, ceiling and roof loads.

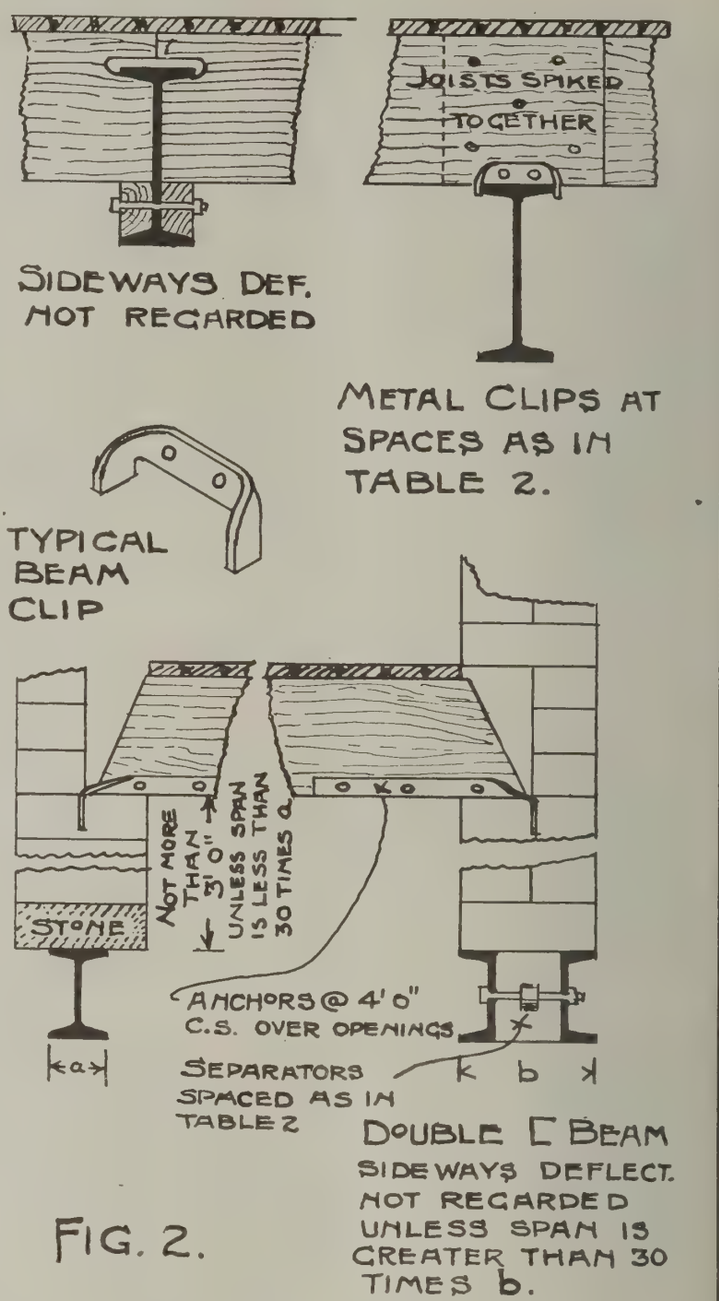

FIG. 2.

Below is a table giving the flange width and spacing of clips or bracing in single beams, and of separators in double beams, but it must be kept in view that this spacing only holds good where the load has been reduced for deflection.

Where this is not done, that is, where beams are loaded to the manufacturers tabular load, the spaces should be two-thirds of that given here.

Spacing of bracing or separators in Standard I beams and channels, loads being corrected for a deflection of 1-360 span.

I BEAMS.				CHANNELS.			
Depth of Beam.	Width of Beam.	Weight per Lineal ft.	Spacing of Bracing or Separators.	Depth of Beam.	Width of Beam.	Weight per Lineal ft.	Spacing of Bracing or Separators.
3-in.	2½-in.	5½ pounds	5 ft. 10-in.	3-in.	1⅞-in.	4 pounds	3 ft. 6½-in.
4-in.	2⅔-in.	7½ pounds	6 ft. 8-in.	4-in.	1⅝-in.	5.25 pounds	3 ft. 11-in.
5-in.	3-in.	9¾ pounds	7 ft. 6-in.	5-in.	1¾-in.	6½ pounds	4 ft. 4½-in.
6-in.	3½-in.	12¼ pounds	8 ft. 4-in.	6-in.	1⅞-in.	8 pounds	4 ft. 10½-in.
7-in.	3⅔-in.	15 pounds	9 ft. 2-in.	7-in.	2 1-10-in.	9¾ pounds	5 ft. 3-in.
8-in.	4-in.	18 pounds	10 ft. 0-in.	8-in.	2¼-in.	11¼ pounds	5 ft. 7½-in.
9-in.	4½-in.	21 pounds	10 ft. 10-in.	9-in.	2⅞-in.	13¼ pounds	6 ft. 0½-in.
10-in.	4⅔-in.	25 pounds	11 ft. 8-in.	10-in.	2 3-5-in.	15 pounds	6 ft. 6-in..
12-in.	5-in.	31½ pounds	12 ft. 6-in.	12-in.	2⅛-in.	20½ pounds	7 ft. 4½-in.
12-in.	5¼-in.	40 pounds	13 ft. 1½-in.	15-in.	3 2-5-in.	33 pounds	8 ft. 6-in.

Another point to bear in mind is that holes in the web of steel beams do not greatly reduce the strength, but holes in the flanges do, so that if lagging is required, it should be so arranged that all the holes are in the web.

The steel beams given in these tables are kept in stock by every manufacturer and kept while in some cases special beams would be more economical, the difficulty of obtaining them in small quantities prevents their use.

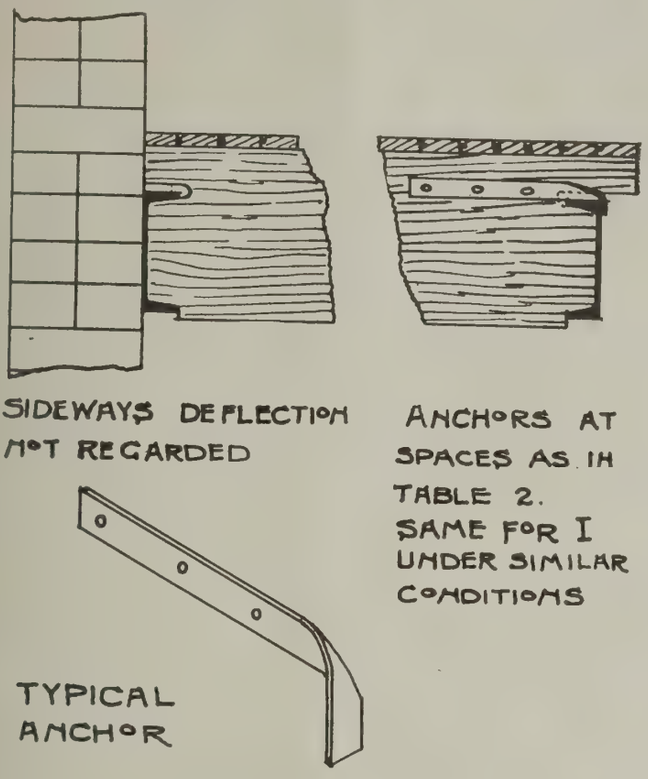

FIG. 3.

The various drawings give a few suggestions of good methods of using steel beams, with typical anchors and separators.

To the poet life's a song;
To the doctor life's a patient
That needs treatment right along.

To the soldier life's a battle,
To the teacher life's a school;
Life's a good thing to the grafter,
It's a failure to the fool.

To the man upon the engine,
Life's a long and heavy grade,
It's a gamble to the gambler,
To the merchant life is trade.

Life's a picture to the artist,
To the rascal life's a fraud;
Life perhaps is but a burden
To the men beneath the hod,

Life is lovely to the lover,
To the player life's a play,
Life may be a load of trouble
To the man upon the dray.

Life is but a long vacation
To the man who loves his work;
Life's an everlasting effort
To shun duty to the shirk.

To the heaven blest romancer
Life's a story ever new;
Life is what we try to make it—
Brother, what is life to you?

ZINC ROOFS

By H. M. SANDERS

THE rise of zinc for roofs of buildings is better known and more generally practiced in England and other European countries, than in this country. In view of thrs fact it may not be considered an inappropriate subject for us to consider at this time. It is true that the use of zinc for roofs in these European countries, is confined to the cheaper class of buildings, and rarely if ever used for buildings of a permanent character. It is also true that some years ago the Society for the protection of ancient buildings in England, issued a pamphlet characterizing zinc roofs as a "pest" spreading over the country. Still, England, like this and other countries, is constantly putting up a large class of cheaper buildings than those of the ancient order, and being of a more temporary character, seeks a cheaper material for the roofs, than lead or copper, whose value as to durability is measured by centuries of use and not by years. So that because of its cheapness as compared to lead or copper, it has thus become more or less a favorite as a roof material for a large class of buildings.

In this country the prevailing metal roofs for our cheaper class of buildings is tin-plated metal. Now how does a zinc roof compare with a tin roof, as to durability?

Not so much perhaps because of the simple fact that it was being used on the cheaper class of buildings, but rather because, realizing that great durability and lasting qualities was the one thing essential in a roof material for permanent buildings, and knowing something of the nature and character of zinc, that it was a short lived metal for roofs as compared to sheet lead or sheet copper whose durability for roofs, had become so well established by centuries of use they seemed to look upon the use of zinc on the cheaper buildings as a kind of menace in the future to what might become the roofs of the permanent buildings. This of course would depend very much upon conditions. What conditions? First, the comparative value of the metal used for the roof, not only as between the zinc and tin plate metal, but the comparative value of the roofing tin plate today as compared to that used 50 or 60 years ago.

Zinc roofs would compare favorably with tin roofs whose base plate was steel, as most of it is as manufactured today, but it would not compare so favorably with the tin plate, whose base is charcoal iron such as was manufactured 75 or more years ago. The tin roofs of this class has a record of 75 years endurance and durability on building. But since the introduction of the steel, as the base of our tin plate, it may be said with truth we believe, that the zinc roof properly put on is the most durable roof, for it will last from 25 to 30 years.

It is true, zinc may vary in value, but, we believe, all that which is made in this country is of a uniform grade of value. In foreign countries, where they use more of it for roofing purposes than in this country, there are more entering this field of its manufacture, and the competition has tended to cheapen the metal in localities both in price and quality. But the best and purest sheet zinc obtainable in Europe, we believe, is that known as the V. M., made by the Vilella Montague Zinc Company of Belgium, as the spelter from their sheet zinc is made is practically pure; as shown by the following analysis:

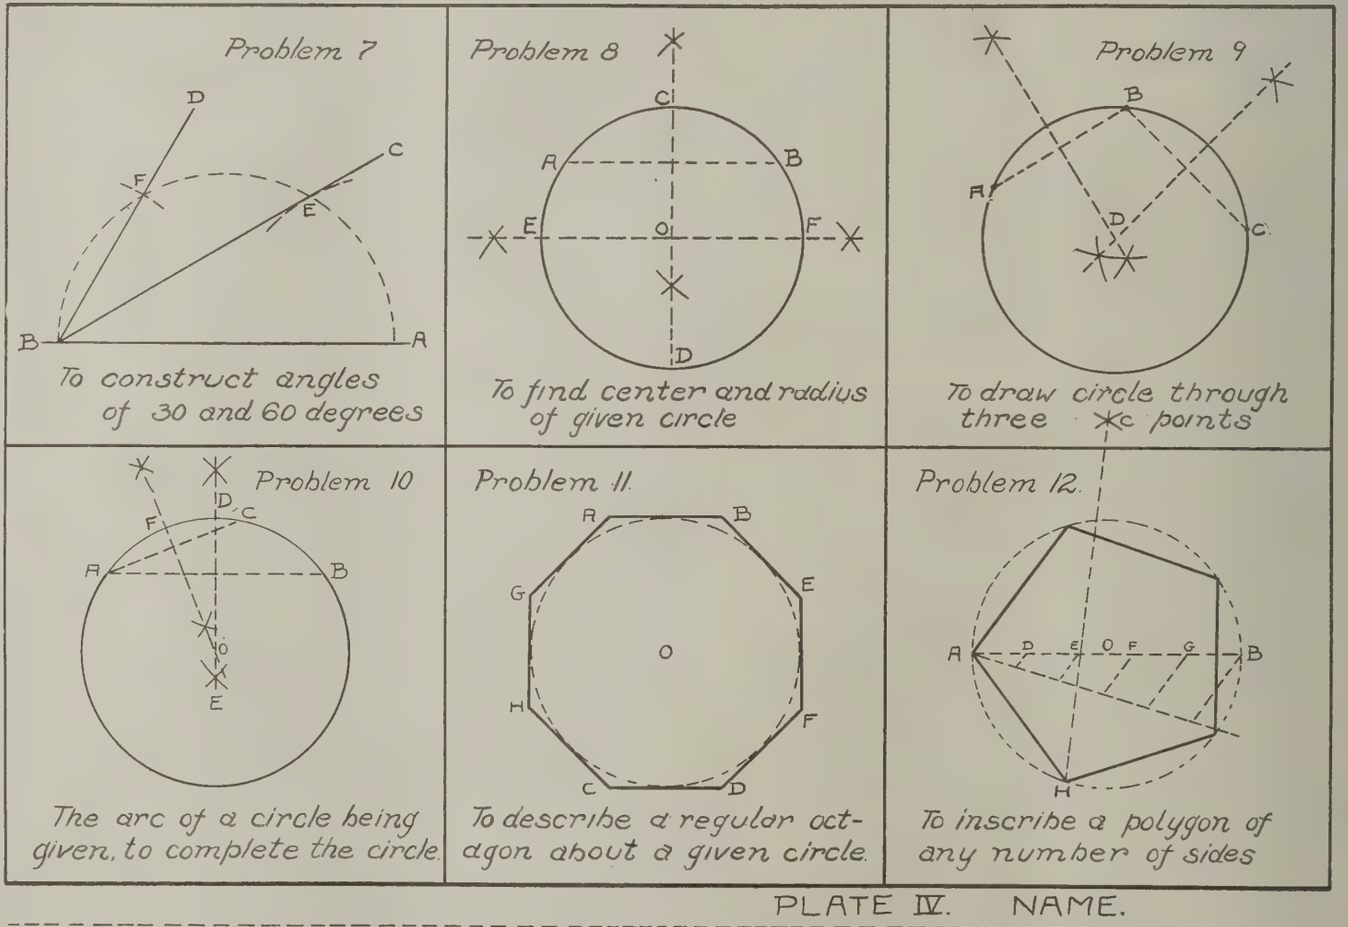
Zinc	0.995
Iron	0.004
Lead, etc.	0.001
	1.000

While absolutely pure zinc is not obtainable, commercially, the amount of alloy in this formula is so small that it is considered practically pure. So that from the very nature of the metal itself being practically pure like lead and copper, and as it is not a plated metal like tin plate, requiring a baser metal for its body plate, is not subjected to the same disparaging conditions as to value, as the tin plate.

The distinguishing feature of a good sheet of zinc, is in its light even color, whereas a cheaper grade would be of a darker hue, with more or less of a mottled appearance, caused by the presence of other alloys, and be more likely to crack when bent, or working it into shape and form.

(To be continued.)

BUILDER'S COURSE IN ARCHITECTURAL DRAWING



RALPH F. WINDOES.

(Continued from December.)

PLATE IV.

EXERCISES IN PLANE GEOMETRY.

LAY out this plate as you did Plate III, as there are six problems to work. Be careful as to where you place the figures in the squares, as you want room left for the lettering. Make your figures large enough, so they will look well, and above all, understand each problem as you work it out, as these exercises will be of great value to you in the future.

PROBLEM 7.

To Construct Angles of 30 and 60 Degrees.—Draw line AB and at any point on it strike a semi-circle. With A as center and radius equal to the radius of the semicircle, draw an arc intersecting at E. With B as center and same radius, draw an arc intersecting at F. Draw lines from B through E and F. Angle ABC is an agle of 30 degrees, and angle ABD is an angle of 60 degrees.

PROBLEM 8.

To Find the Center and Radius of a Given Circle.—Draw the chord AB and bisect it by the perpendicular CD. Bisect CD by the line EF and the intersection at O will be the required center, and OF the radius.

PROBLEM 9.

To Draw a Circle Through Three Points Not in a Straight Line.—Locate the points ABC and join them by straight lines. Bisect the lines AB and CD by perpendiculars meeting at D, and with D as center draw a circle through the points.

PROBLEM 10.

An Arc of a Circle Being Given to Complete the Circle.—Join the extreme points of the arc by the chord AB, and bisect it by the perpendicular DE. From A draw chord AC and bisect it by FO and where it meets DE is the center of the circle of which ACB is an arc.

PROBLEM 11.

To Describe a Regular Octagon About a Given Circle.—This method is purely a mechanical one, and strictly speaking should not be called a problem in plane geometry. Draw the circle whose center is O and the horizontal AB and CD parallel to each other and touching the circle. Next draw the verticals EF and GH parallel to each other and touching the circle. With the 45 degree triangle complete the octagon.

PROBLEM 12.

To Inscribe a Polygon of Any Number of Sides.—This is a very good method and should certainly be retained in the memory of the student. By it you can draw a regular figure of any number of sides. For example, we will draw a pentagon, or five-sided polygon. Draw the circle whose center is O and divide the diameter into the same number of parts as there is sides to the figure, in

this case five. To divide the diameter, use the method given in Problem 4. With A as center and radius AB, strike an arc at C, and with B as center and same radius strike an intersecting arc. Through C and the second division E, draw CH to the circumference. Then chord AH is one side of the pentagon. Step off the remaining sides with the dividers.

PLATE V.

EXERCISES IN PLANE GEOMETRY.

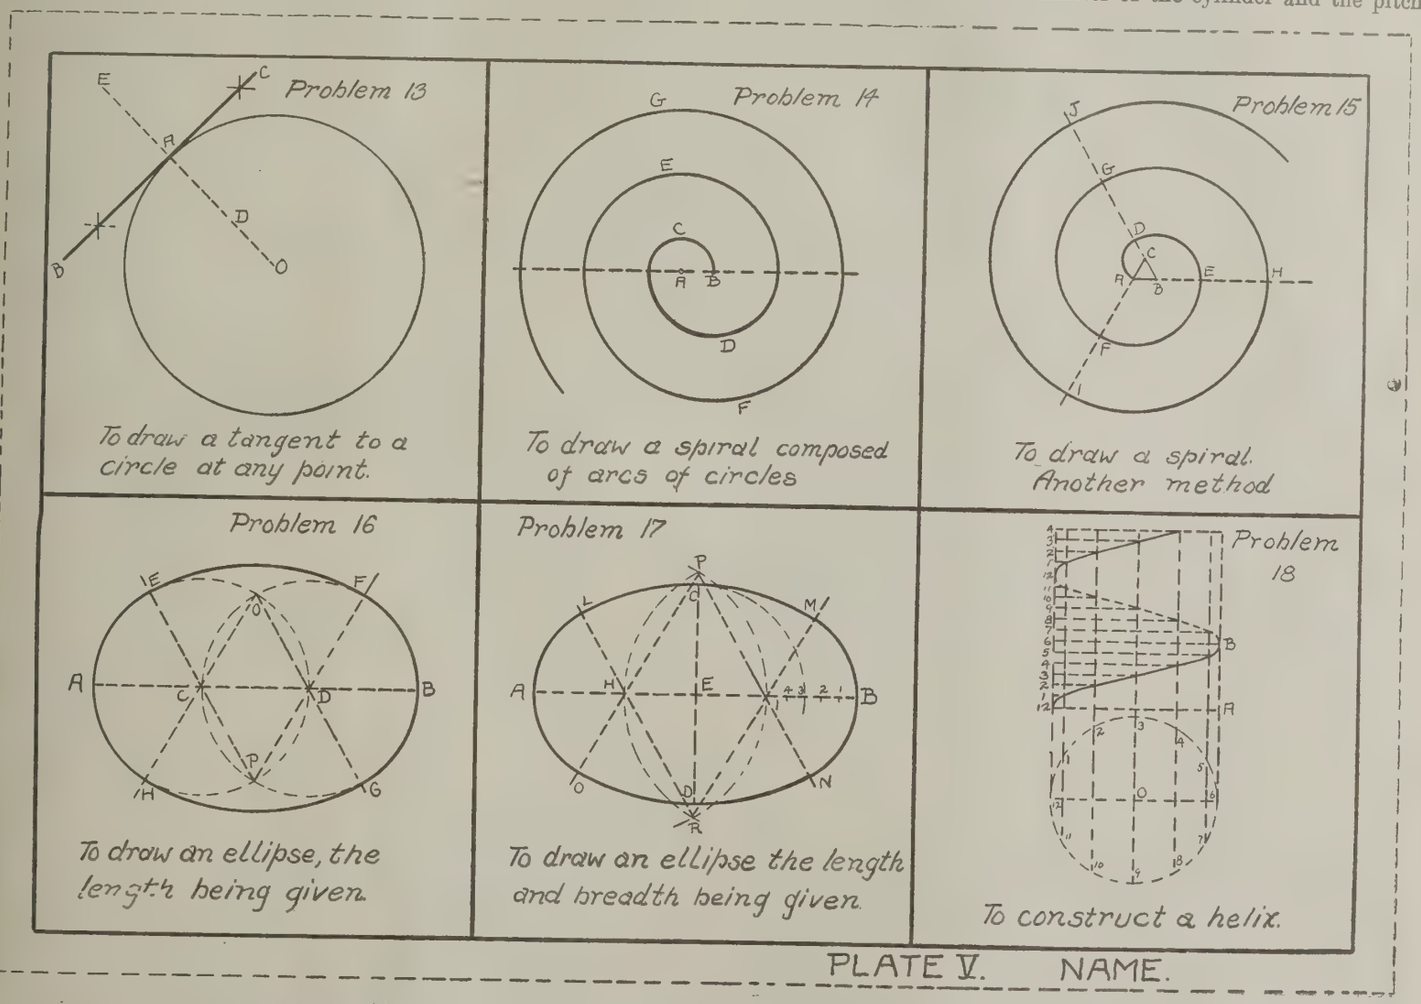
Lay out this plate as you did Plates III and IV, and finish it the same.

PROBLEM 13.

To Draw a Tangent to a Circle at Any Point.—Given circle whose center is O. To draw a tangent to it at point A. Draw OA and continue it. Lay off AD equal to AE. At E and D, strike arcs interesting at B and C. Connect these points and BC is tangent to the circle at point A.

PROBLEM 14.

To Draw a Spiral Composed of Arcs and Circles.—Produce a straight line through AB indefinitely both ways. With A as center and AB as radius, describe the semi-circle C; then with B as center draw the semi-circle D, joining C, and continue this operation, using the centers A and B alternately.



PROBLEM 17.

To Draw an Ellipse, the Length and Breadth Being Given.—This is also a false ellipse and should properly be called an oval. With E as center and EC as radius, draw arc cutting AB in F. Divide FB into three equal parts and continue another to 4. Take the distance B4 and set it off on each side of the center E, at H and I. With H and I as centers and radius equal to HI, describe arcs cutting each other at P and R. From these last points draw indefinite lines through H and I. With H and I as centers, and radius equal to HA, draw the arcs OL and MN. With P and R as centers and radius PD, describe the arcs ON and LM, to complete the figure.

PROBLEM 18.

To Construct a Helix.—If a point travels around and up, or down, a cylinder with a uniform motion, we say the path it describes is a helix. The screw thread is an example of this. The line of a winding stairway is a helix and not a spiral stairway as it is commonly called. The pitch of the screw thread is the distance between threads measured along the axis of length. The pitch of the helix is the same. In Problem 18, AB is the pitch.

To draw the curve the diameter of the cylinder and the pitch

PROBLEM 15.

To Draw a Spiral (Another Method).—Construct the small equilateral triangle ABC and produce its sides. With C as center and AC as radius, describe the arc AD. With B as center and BD as radius, describe the arc DE. With A as center and AE as radius, describe the arc EF. Continue this operation, using successively points C, B, and A.

PROBLEM 16.

To Draw an Ellipse the Length Being Given.—This is not a true ellipse, as it is composed of the arcs of circles, but it serves as one in nearly every case. Divide the given length into three parts, AC, CD, and DB, all equal in length. With C and D as centers, and AC as radius, describe two circles cutting each other in OP. From OP, draw lines through CD, cutting the circles in E, F, G, H. With O and P as centers, and radius equal to OH, describe arcs between HG and EF, to complete the figure.

must be known. Draw the circle whose center is O with the given diameter. Divide the circumference into an even number of equal parts, in this case twelve. Lay off a rectangle above the circle whose base is equal to the given diameter. On one side of the rectangle lay off the pitch. Divide the pitch into the same number of parts as the circle was divided. Number the points on the circle and on the rectangle. Draw vertical lines up from the points on the circle, and intersecting horizontal lines over from the points on the rectangle. Points of like number should intersect. Through these points draw a neat irregular curve, as shown. Where the line comes up on the other side of the cylinder, it is out of our view, so it is put in dotted.

(To be continued.)

OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. ANSWERS

STAIRS WITH WINDERS.

From One of the "Chips," Toronto, Ontario.—In answer to "Mechanics," of Rochester, N. Y., I send the inclosed diagram, which will show him how to set out his treads full size on the floor directly under where the stairs are to stand. Fig. 8 shows the plan for a stair in which both flyers and winders are seen, both in the plan and on the strings. P P P is the plan, A and B the strings, and E E the joint whenin place. The bevels are found at E E, and at the foot and top floor. M M shows the quarter cut, which is divided into three parts, and from the center C lines are drawn cutting the quadrant at the points of division, and continued through until the other side of the stair is reached. This division makes the lines for the winders. Another plan of stairs having four winders is shown at Fig. 9. Explanations are unnecessary. Another plan having seven winders is shown at Fig. 10. This has a circular well, as seen at A B C D E. Treads and winders are all numbered, so the whole is plain and easily understood.

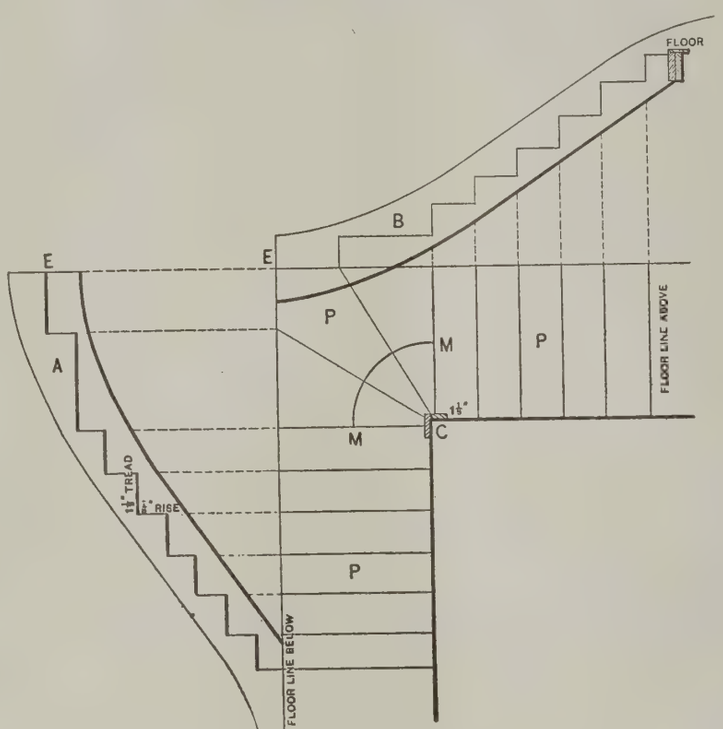

FIG. 8.

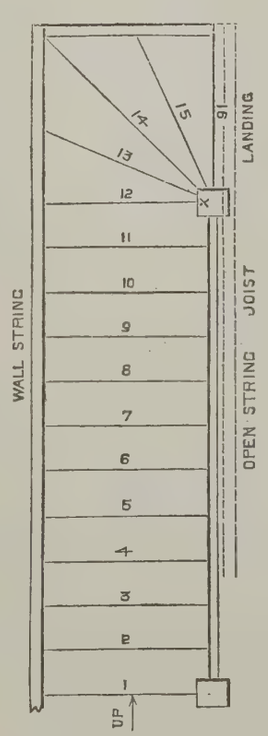

FIG. 9.

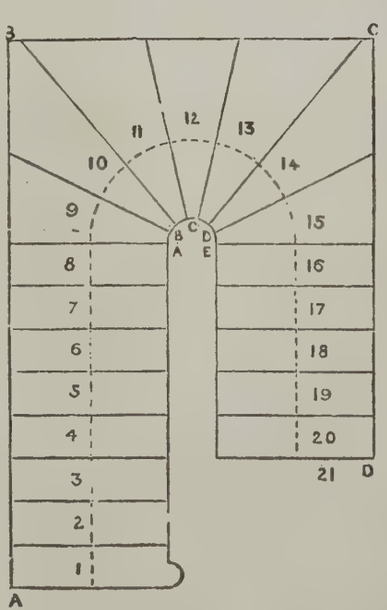

FIG. 10.

OCTAGON BAY WINDOW.

From "One of the Chips," Toronto, Ont.—In answer to this request I send you the following method of forming an octagon, and from this any window or other structure can be laid out. Let H J, Fig. 7, be the given side; at right angles to H J draw J S and H R indefinitely; on J as center with J H, as radius mark the quarter circle O K N; on H as center with the same radius, mark the quarter circle P L M; bisect the quarter circles K and L; connect J K and H L; draw K T and L Q parallel to J S and H R; make K T, T S, L Q and Q R each equal J K or H L; connect T S R Q and the figure is complete.

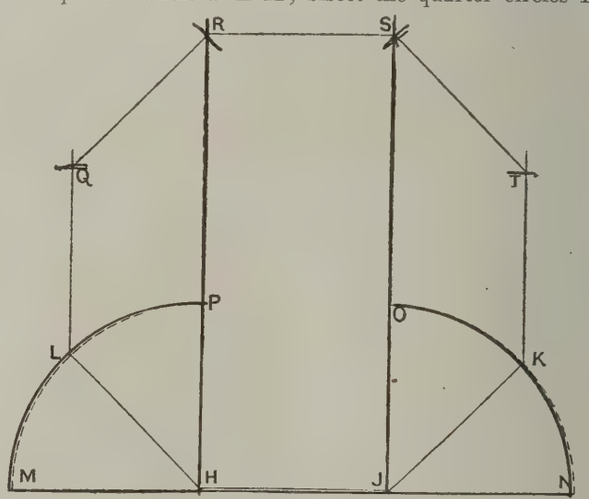

FIG. 7.

CUTTING PLATE GLASS.

From "A. Ashmun Kelly," Malvern, Pa.—The painter of Duluth, Minn., who wishes to know how to cut plate glass, as his diamond will not cut deep enough, is advised to secure a heavier diamond, one made for the purpose. I have seen men cutting the heaviest plate glass with a heavy diamond, and as easily as a painter will cut an 8x10 window glass. He will draw the diamond steadily along the straight-edge, then take it up in both hands and give it a slight knock on his knee and the piece cut off will break away nicely. Having had some little experience with cutting window glass, as a painter, I was surprised to see how apparently recklessly the professional cutter did his work, and I asked him if he did not feel nervous or fearful of breaking the glass, as that was always my feeling. He replied no, that if he should happen to break a light or plate, even, there were plenty more on hand. It requires nerve or confidence to become an expert glass cutter, and the man who hesitates when cutting glass is usually lost.

CUTTING PLATE GLASS.

From "J. A. B.," Lake Megantic.—In answer to question relating to the cutting of plate glass, I have done the cutting very easily, in making a line with the diamond on both sides of the plate to be cut. I have not experienced any difficulty in separating the glass. I think if Mr. Painter of Duluth, Minn., makes a trial of it he will be pleased with the results.

RUBENS.

From "G. M. L., Ontario, Canada.—Replying to "Clam Digger," Norwalk. Rubens painted his great picture, "The Descent from the Cross," in 1608. This picture is considered his masterpiece, and is now in the Cathedral of Antwerp.

BIRD'S EYE MAPLE.

From "C. H. R.," Hutchinson, Kans.—I am comparatively a new subscriber and I am quite pleased with THE NATIONAL BUILDER. Some months ago I noticed an inquiry regarding "bird's eye maple," and up to date I have not seen it properly answered, so I send you the following: "Bird's eyes, or the similar marks, are formed by the circular inflections of the fibers formed around spicules, or small sharp points, which protrude from the inner surface of the bark into the soft woody tissues. A plank is covered with numerous small spots, like minute knots, looking like 'bird's eyes,' hence the name."

INSIDE FINISH AND CABINET WORK.

From "Joiner," Chicago, Ill.—Before being able to reply intelligently to the query asked by "C. M. K.," Modesto, Cal., I would require more particulars of what he really wants. If he will ask again and say whether it is moldings, door trim, window trim, stairs, base or what, and I will try and answer and send for publication. I will leave to others acquainted with cabinet work better than I to submit designs in this branch of woodwork.

CABINET WORK.

From "Wm. R. W.," Toledo, Ohio.—Replying to "C. M. K.," Modesto, in part, I submit the following designs, which I think

FIG. 4.

may prove useful. Fig. 1 shows designs for bedroom furniture which are not expensive, and may be made of oak, mahogany, cherry or birch stained. Fig 2 is "a buffet" of simple design and construction. Fig. 4 shows a mission table in simple lines. Fig. 5 is a kitchen cabinet, and so designed that any ordinary workman will be able to make one. These pieces are designed mostly for oak, but they may be constructed of almost any wood material and stained to suit. I might say that real good works on modern cabinet-making are published by "The Popular Mechanics" of Chicago, and by The Manual Training School Publishing Company, Peoria, Ill. These books do not cost much. They run, I think, from 50 cents to one dollar each. I daresay they could be obtained through the publishers of THE NATIONAL BUILDER like other books they advertise.

FIG. 2.

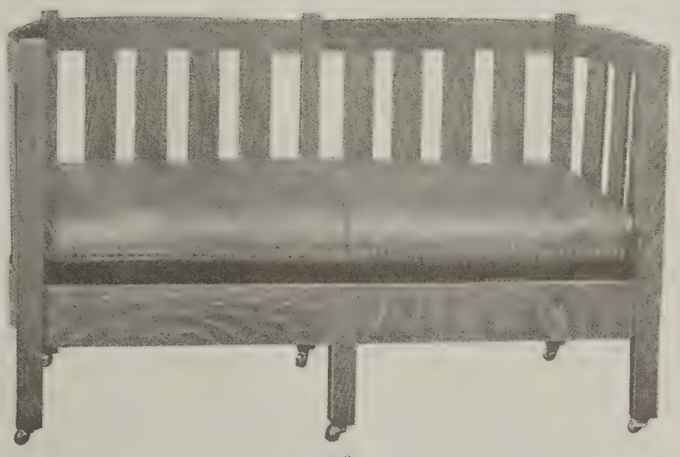

FIG. 3.

FIG. 5.

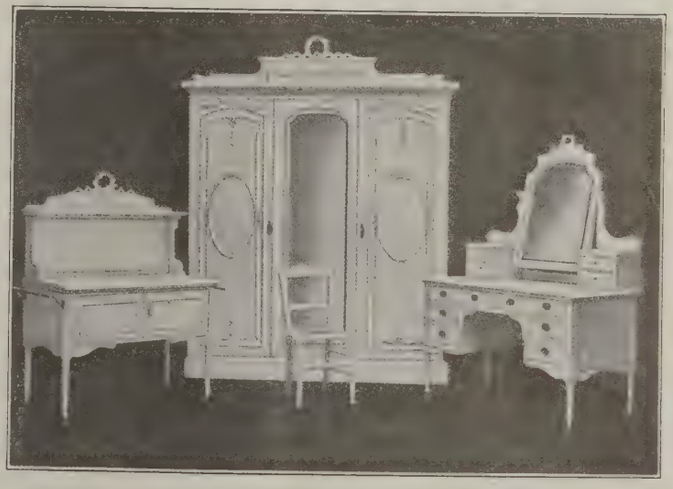

FIG. 1.

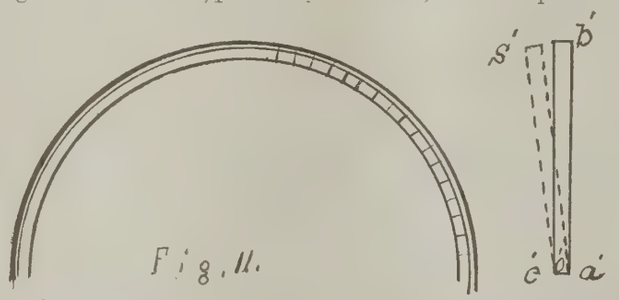
SPECIFICATIONS.

Answering C. W. C., Vancouver, B. C.—We are preparing just such a set of specifications as you ask for, and will begin their publication shortly.—(Ed.)

BUFFETS AND SIDEBOARDS.

In reply to D. H. J., Syracuse, N. Y.—We have published from time to time designs of furniture such as you ask for, and will continue to do so, and will bear you in mind when choosing designs for publication in future issues.—(Ed.)



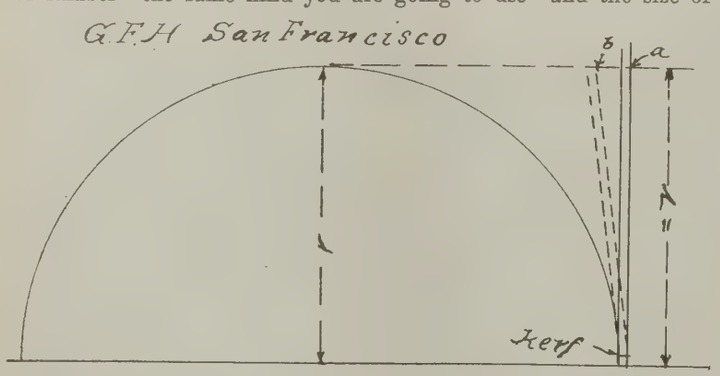
INLAYING.

From "A. D. A.," Chicago, Ill.—Answer to question on inlaying from J. C. O. L., Milwaukee, Wis.: It took me a long time to find out where I could get a book on inlaying or marquetry. The only book of this kind was written by Wm. Bemrose, and is published by Bemrose & Sons., 23 Old Bailey, Derby, London, England.

That is where I sent for one. The book shows how to do the work fully and has ninety colored plates and designs. The price is $3.00. I learned to do the work from my book, and will sell it to you at much less than cost. I am not in the book business, but always willing to help a reader of THE NATIONAL BUILDER.

KERFING.

From "T. A. F.," Washington, D. C.—If G. F. H., San Francisco, Cal., will first find the radius of his circle, then take a piece of stuff of a suitable length and equal to the thickness of that which is to be bent, as at c a, and let a b be equal to the radius of the curve around which it is to be bent; make a saw kerf at c' o' having a thickness of ¼ of an inch uncut; nail the piece below



c' a' and move it from b' to s', or enough to close the saw kerf at c', then b' s' will be the given distance between two saw kerfs. Use the same saw for all the kerf.

NOTE.—The editor has fully a dozen answers to this inquiry which have been sent in to him, and there is a sameness in them all. Those given are all that are required, but we thank our readers for their answers, although we may not use them.

KERFING.

From "J. W. S.," Los Angeles, Cal.—In order to get proper curves it may be necessary to experiment a little to get the proper number of saw cuts, and the proper distance of them. Take a piece of lumber—the same kind you are going to use—and the size of

ANS. TO NO. 428. FIG. 6.

the piece you are going to bend; it need not be longer than radius of your circle. Saw a kerf near the end, place it in the vise and screw tight, then bend over until the kerf closes; the distance the top moves, as from A to B in Fig. 6, will give the distance between kerfs. Use the same saw all the time and saw to the same depth, leaving about a quarter of an inch solid wood below the kerfs.

QUESTIONS

BAY WINDOWS.

From "Joel Winder," Manitown, Wis.—I would like to see a few designs for bay windows, with or without transoms, and having small lights on top. I would like also to see a design for a step-window for a hall running up the incline of the stairway. Would like three sashes, or three sheets of glass in the bays, and in the step-window. Such designs would be very much appreciated by one of your oldest subscribers?

TIN ROOFS.

From "R. O. N.," Scranton, Pa.—Is it good policy to paint tin roofs, and if so, what kind of paint should be used?

SHINGLE ROOFS.

From "Michael Z.," Green Bay, Wis.—How long should ordinary shingles hold good? Does painting a shingle roof add to the life of the roof? In painting a roof, what kind of paint is the best to employ for the purpose? Any other information on the question of shingle roofs will, I am sure, interest many readers beside the writer.

FIREPROOF ELEVATOR SHAFTS.

From "Chicago Man," Chicago, Ill.—I am about to build a "Skyscraper" in which there will be several elevator shafts, and I would like to find out if there is any method of making the shafts fireproof, or nearly so, and of preventing the shafts from becoming a flue in case of fire? I am somewhat confused on the question owing to getting so many conflicting opinions on the subject. I will draw my own inferences from whatever you may say, and I think, judging from past experiences, that I will get some good pointers from you and your subscribers.

TAPER FRAMING.

From "John W. K.," New Ontario, Ont.—How are the bevels obtained for framing tapered work, such as the shoulders on posts, the bevels on braces, etc.?

TAR AND GRAVEL ROOFS.

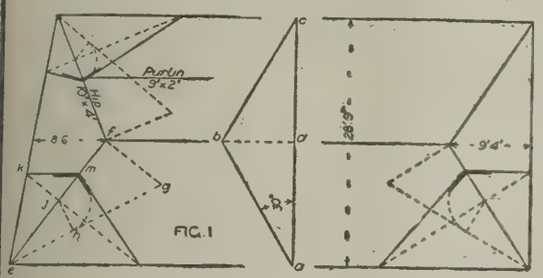
From "A. J. C.," Erin Springs, Okla.—Will some kindly disposed reader please inform me of the best method of putting on a tar and gravel roof, and the best materials to use for the purpose, and oblige an old reader?

HIPS AND VALLEYS.

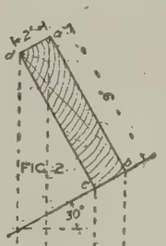
From "J. A. B.," Lake Megantic.—I would be thankful if some reader would send to this department of "our favorite paper" if there is a way of finding the lengths and bevels of hip, valley and jack rafters without the need of making a drawing. Any answer on the subject will be greatly appreciated.

REGISTER DESK IN WALL.

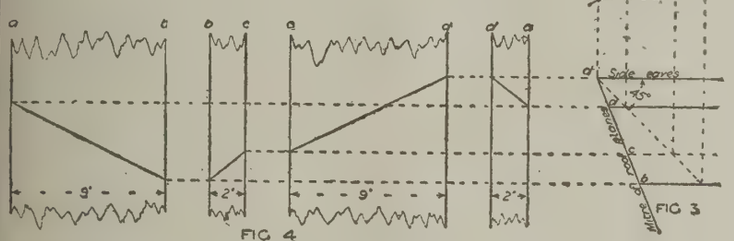
From "Davis," Sacramento, Cal.—I am to make a register desk and would like some information as to the way it should be made. I give the conditions as near as possible. The register book is 18x20 inches when open, and it must be made to hold the book when closed, and the desk or cabinet must not project beyond the wall to which it is fastened more than 3 or 4 inches, as the space is limited. Any information will be thankfully accepted.



From F. H. R., Buffalo, N. Y.: I have been a subscriber to the NATIONAL BUILDER for the last three or four years and like it very much. I would like to see some designs of houses of about 24x38 ft., or 26x40 ft. in size and of true Colonial design published in the BUILDER soon. I would appreciate this very much.



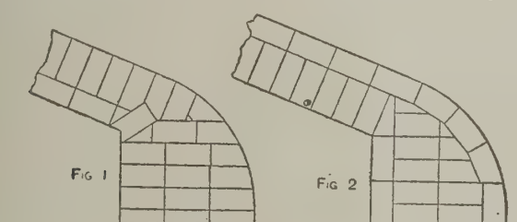
From J. B. R., Palestine, Texas: Can't find information. Have any of the brother contractors used what is called Beaver Board, made by the Beaver Board Company at Buffalo, N. Y.? It is made to take the place of plaster on the inside and to decorate with. This country is damp and I think it will go and come to the weather. I have tried from leading architects to get this information but have failed. It seems new to them. If any contractor has used it please answer through the BUILDER'S columns his experience with it and I will appreciate same.

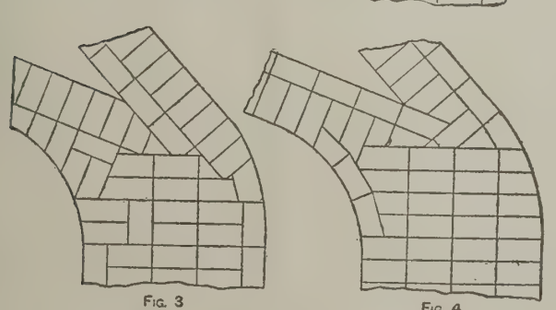


OUR PRACTICAL COLUMN

BEVELS FOR HIPS AND PURLINS MAY BE OBTAINED AS FOLLOWS:

Draw the plan of the roof as in Fig. 1, and the outline section a b c d. For the backing of hip rafters draw f g at right angles to c f and equal to b d. Join g e, and from any point h in e g draw h j at right angles to e g. Through j draw k j l at right angles to e f, cutting the end and side eaves in k and l. With center j and radius j h describe an arc cutting e f in m. Join k m and l m, and the angle k m l gives the backing of the hip rafter; but it must be observed that the backing is not uniform for the two sides, being e m l for one side and e m k for the other. The backings of the other hip rafters may be found in a similar manner, as shown in Fig. 1.





To find the bevels of the purlins draw sectional elevation of the purlin marked in Fig. 1 at its proper angle, as in Fig. 2, and the plan as Fig. 3, where a line of 45 degrees is drawn from d to receive the projections from Fig. 2. Lines are then drawn parallel with the eaves through the intersections to meet the mitre line of roof planes. Then from the points a b c d on the mitre line project across to the corresponding elevations of the four faces of purlin in Fig. 4. Join the two points on each face of purlin, and the required cuts will be obtained. The same process may be adopted for the other purlins.

FLUES.

The bonding, of which many different arrangements might be given, for outside wall of flue at the point where it meets bedroom or other inside wall, is shown in Figs. 1 and 2, while the bonding for the two middle walls of the flues at their junction with

the middle wall of the bedroom is shown in Figs. 3 and 4. The width of the flue is marked 5 feet on the pencil sketch sent, but this makes no difference in the bonding of the walls, but affects the setting out of the work and requires careful attention.

COST DATA FOR APPROXIMATE ESTIMATES AND APPRAISALS.

The cost is based on per cubic foot of Building Contents exclusive of Scenic or other features, Lighting Fixtures, Mural and Art Painting, Incidentals, etc., and are charged at from 6½ to 7 4-5 cents per cubic foot.	TYPES OF CONSTRUCTION			
	ORDINARY	FIRST CLASS	HIGH GRADE	ELABORATE
Architect's Fee	1⅛	1¼	1⅜	1¾
*Brick and Brick Work	4	4½	5¾	6⅝
Bronze and Brass Work	1/4	1/4	½	⅞
Carpenter Work	4⅛	1⅙	2⅞	3¼
Cast Iron	¾	⅞	1⅛	1⅞
Composition Flooring		⅛	¼	⅝
Concrete	1/16	2/3	⅞	1¼
*Concrete Block Work	3	3	3⅛	4¼
Concrete Reinforcement		½	⅝	1¼
*Cut Stone and Cut Stone Work	3 1/16	6	6⅝	8½
Electric Work	¼	2/3	⅞	1½
Elevator Work	2/3	1	1¼	1¾
Excavation	¼	¼	⅜	⅜
Foundation Work	¾	1¼	1⅝	2¼
Gas Fitting	1/16	⅛	1 1/16	1¾
Glass and Glazing	5/32	5/32	¾	⅞
Hardware	⅛	1/16	1/16	⅝
Heating and Ventilating	1⅛	1¼	1¾	1⅞
Lathing	¼	¼	⅜	⅜
Ornamental Metal Work	¾	1⅛	1⅛	1⅞
Painting	½	¾	1⅛	2⅝
Plastering	1⅞	1⅞	1⅞	2¼
Plumbing	½	¾	1⅛	1⅛
Power Plant	¾	¾	1⅛	2⅛
Roofing and Accessories	½	¾	1⅛	1⅜
Sheet Metal	⅛	½	½	⅞
Skylights	1/30	1/30	1/16	¼
Structural Steel and Iron	⅞	2½	2½	2½
Stucco Work	⅞	1¼	1¼	1¾
*Terra Cotta and Faience (Trim)	½	⅞	⅞	1¼
Terra Cotta Blocks	⅛	2/3	2/3	⅞
Tiling and Mosaic	¼	⅜	⅞	⅞
Waterproofing and Dampproofing	⅛	¼	⅜	¾

Note.—These items are alternates for exterior work and are used or omitted as design may determine. For interior work the averages are approximately correct. Prepared by Duncan M. Robertson.

QUATRE-FOIL.

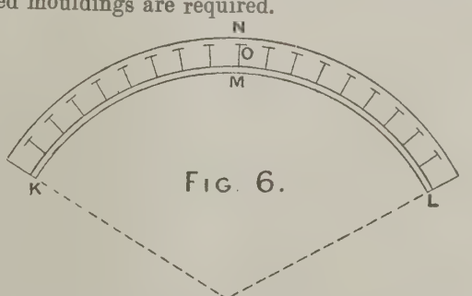


Fig. 3 shows a method of forming a quatre-foil, which is often used in gothic work.

KERFING.

The method of kerfing shown in Fig. 6 is not valued very highly, yet occasionally it is made use of to good advantage.

For bending mouldings, saw kerfing was once in general use in this city; now no superintending architect will allow it; solid or laminated mouldings are required.

Let K M L be a thin veneer bent over the required form. Clean the dust out of the saw kerfs and put plenty of glue in and on the face, then lay the saw kerfed stuff on the veneer as shown—braces should be screwed over the whole at intervals, to keep them snug to the form till the glue is set. The form may be built so that N, the convex surface, or M, the concave, may be face-side. Saw kerfed work without the veneer glued on the kerfed side, as here shown lacks strength and is good for nothing.

BOOK NOTICES.

PRACTICAL STEEL CONSTRUCTION.—Dealing with all phases in the construction of our modern steel buildings. With illustrations, drawings and valuable tables. Compiled and edited by Fred T. Hodgson, F. R. I. C. A., author of "The Steel Square and Its Uses," "Practical Carpentry," "Estimators Guide," "Light and Heavy Framing, etc., etc., published by Frederick J. Drake & Co., Chicago, Ill. Cloth, 105 pp. Price, postpaid, $1.00.

This is a valuable little book for steel constructors—men who do the work—as it gives many hints as to the various methods, and the tables will be found quite useful in determining the ditch and place of rivets, and many other things that a foreman or workman ought to know. It is simply a manual of an advanced kind, and informs the student regarding live and dead loads. What floors in houses, shops, factories, and warehouses should carry per square foot, and how to calculate for this strain; along with many other items of useful and necessary information.

DUSTMAN'S BOOK OF PLANS AND BUILDING CONSTRUCTION.—Consisting of drawings, plan drawing, figuring and estimating, specifications, building bungalows, farm buildings, concrete work, Joiners finishins, and building work generally. By U. M. Dustman, licensed architect. 240 pp., 8x12 inches, over 300 illustrations. Published by The Chas. C. Thompson Co., 545-549 Wabash avenue, Chicago, Ill. Canvas bound. Price, $2.00.

This is somewhat of a pretentious book in appearance, but its contents do not belie its looks, as it is really a "big book," in fact as well as in looks, containing as it does, an immense amount of really useful and practical information for the general builder, the carpenter, the bricklayer and the mason. Its chief value, however, lies in the large number of house plans, bungalow plans and plans for barns, stables, garages and other farm and domestic buildings. The book also cotnains articles on the arrangement of rooms, conveniences, method of planing, and on many other live subjects; also a very full treatise on carpenter's geometry, and methods of laying out work of various kinds. Another good feature is the showing of working details in the latest style. It is a good all around book for the general workman, and its low price puts it within the reach of everyone. It is well bound, and is printed on fine heavy calendered paper.

We note that our popular Cotem., "Woodcraft," of Cleveland, Ohio, has invaded the British Empire and opened a publishing office in London. We congratulate Brother Clegg and wish it may bring them all the success they deserve.

STANDARD PRACTICAL PLUMBING. By R. M. Starbuck, author of Modern Plumbing, etc. 450 pp. and upwards of 340 illustrations, specially made for the purpose and drawn in such a manner the reader will have no difficulty in understanding. The work is published by the well known firm of Norman W. Henry Publishing Company, New York, N. Y. Cloth bound, heavy paper. Price $3.00.

We have gone over this work at greater length than usual and have no hesitation in stating that we are satisfied it is equal, if not superior, in both quantity and quality of matter presented, to any work we know of, on the subject of plumbing, and the style of text and manner of presenting it seem to be well adapted to the readers for whom the work was prepared—i. e., the operative plumbers. It is a plainly written book, in the simplest of English, and each page bristles with good sense and profitable instructions. The drawings are practically presented and suited to practical men having practical wants.

Of the three hundred and forty-seven illustrations contained in the book, one hundred of them are full page illustrations. The illustrations, all being drawn expressly for this work, show the most modern and best practice in plumbing construction.

Plumbing in all its branches is treated within the pages of this book, and a large amount of space is devoted to a very complete and practical treatment of the subject of hot water supply and circulation and range boiler work.

Another valuable feature is the special chapter on drawing for the plumber.

The book is well made, is strongly bound in boards, and the paper used is of fine quality, while the press work is beyond reproach. The type is large and clear, and the diagrams and illustrations are fine and clear, every line being distinct and well defined.

BROOKS' AUTOMOBILE HAND BOOK. By L. Elliot Brooks, M. E. Revised and enlarged by Calvin F. Swingle, M. E., and other experts, 1911 edition, brought to date and includes all recent inventions and improvements. Over 700 pages and between three and four hundred diagrams and illustrations. Published by Frederick J. Drake & Co., Chicago, Ill. Limp leather covers, well bound. Price, prepaid, $2.00.

To those having anything to do with the making, repairing or managing a motor car of any kind, this book is an indispensable requisite, as it deals with every item that goes into the "make-up" of a complete machine. It is a strictly up-to-date treatise, and deals in a thoroughly practical manner with all the various questions relating to the construction, care and operation of gasoline, electric and steam motor cars, with diagrams of each part, together with clear, concise explanations of the principles governing their action; correct methods are also given for dealing with road troubles, motor troubles, carburetor and ignition troubles of every kind. It also contains valuable information regarding ignition systems, carburetors, magnetos, valve setting, indicator work and other important matters. There are also a number of useful tables, rules and formulas, which add much value to the work and make it an exhaustive compendium of automobile knowledge; and the text is laid before the reader in a style that is at once simple and understandable. The book is nicely gotten up, printed in medium sized type on good, strong paper, well bound, and may be used as a pocket reference book if desired. Every motor car should carry one of these books in a waterproof case in some corner that would be handy to reach. It would often be found useful in emergencies.

LATEST LEGAL DECISIONS

Under St. 1890, p. 370, c. 418, requiring the execution of a formal contract for the erection of a public building for a city in addition to the acceptance of the proposal, and providing that every proposal shall be accompanied by a deposit for the performance of the proposal, a bidder for the erection of a schoolhouse, who agrees that if, within 20 days after a specified date, notice that his proposal is accepted be given him, he will deliver a contract for the work, and that the deposit shall be the property of the city on his failure to carry out the proposal, must stand by his proposal, at least until the expiration of the specified time, and the acceptance by the city of a lower bid is not a rejection of his bid, and a subsequent acceptance of his bid within the specified time, after refusal of a lower bidder to enter into a contract, is binding on the bidder, and on his failing to execute the contract the deposit is the property of the city.—Wheaton Building & Lumber Co. v. City of Boston, 90 N. E. (Mass.) 598.

Property cannot be subjected to a mechanic's lien for material furnished under a contract with one who is not the owner's agent.—H. C. Behrens Lumber Co. v. Lager, 125 N. W. (S. D.), 574.

A building contractor could not recover for work done till it was approved and accepted by an architect, as the contract provided.—Papot v. Barbour, 51 So. (Ala.), 725.

A carpenter engaged in the construction of a building and a man operating a freight elevator in a retail store are engaged in different departments of labor, and are not "fellow servants," under Civ. Code, Sec. 1970, as amended by St. 1907, c. 97, limiting the fellow servant rule to cases of servants of the same master engaged in the same department of labor.—Morgan v. J. W. Robinson Co., 107 P. (Cal.), 695.

The owners of an amusement park and contracting plumbers doing work on the premises might be held jointly liable for an injury to an employe of the plumbers as wrongdoers acting independently, whose tortious conduct concurrently contributed to the injury, where the injury resulted from the servant slipping on oil on the floor from a defective oil cup in a building in which he had been sent in the night time.—Bagley v. Sonderland Co., 91 N. E. (Mass.), 317.

While a waiver must be made with knowledge of all the facts by the party waiving it, the agent of a company which was surety on a construction contract by accepting the balance of the contract price after the contractor had abandoned the work, and stating that the owner need not worry as the matter would be settled up, waived notice to the surety of the contractor's defaults, as required by the surety contract.—Boppart v. Illinois Surety Company, 126 S. W. (Mo.), 768.

There was testimony that plaintiff was discharged successively by two employers, because each of these employers were successively warned by an agent of the defendant, a labor union, that, if the employer kept the plaintiff in his service, all members of the union would quit his employment in a body. The purpose of this warning was to impress upon the employer the danger that he would be stripped of his ability to complete certain contracts unless he discharged the plaintiff, and the purpose was ultimately to coerce the plaintiff, who was a member of a local in another union, to join the defendant union. Held, that the finding of the court sitting as a jury that the plaintiff was entitled to recover against the union for inducing his discharge was not error.—Ruddy v. United Association of Journeymen Plumbers, Gas Fitters, Steam Fitters and Steam Fitters' Helpers of the United States and Canada, Local No. 24. 75 A. (N. J.), 742.

Plaintiff, a carpenter, employed to do certain work in an elevator shaft, was injured by the sudden operation of the elevator by another of defendant's servants without warning. Plaintiff and the elevator man had agreed that, before the elevator was moved, the operator would call out to plaintiff, and should not move the elevator until answered, "All right." He did move it without calling out and plaintiff was injured. Held, that, though plaintiff assumed the risk of injury involved in working in the shaft, he did not assume the risk of the negligent use of the elevator by defendant, under the rule that an employe by voluntarily putting himself in a place of danger does not thereby necessarily assume the risk of injury from his employer's want of care.—Morgan v. J. W. Robinson Company, 107 P. (Cal.), 695.

The mechanic's lien act (Laws 1897, c. 418) provides for enforcement of such liens in a court which has jurisdiction in an action founded on a contract for a sum of money equivalent to the amount of the debt, and provides that the lien may be enforced "against such property and against the person liable for the debt," and required the filing of a lis pendens when the action is brought, whether in a court of record or not, and provides that failure to do so shall not abate the action as to any personal liability for the payment of the debt. The Municipal Court act (Laws 1902, c. 580) gives municipal courts jurisdiction of "an action to enforce a mechanic's lien on real property in which the court shall have power to render judgment for the sum due with interest * * * and to declare the amount a valid lien against the interest of the defendant in the property described in the complaint * * * where the amount does not exceed $500," but provides that such court cannot render judgment for the foreclosure and sale of the property. Held, that the meaning of the statutory provisions relating to the jurisdiction to enforce a mechanic's lien must be ascertained from all the provisions considered together, and from the general scope of the statutes and purpose in view, and that the Municipal Court has jurisdiction to enforce a mechanic's lien.—Nelson v. Hajek, 121 N. Y. S., 1018.

ASBESTOS "CENTURY" SHINGLES

"THE ROOF THAT OUTLIVES THE BUILDING"

It's the easiest thing in the world to interest a client in a roofing that needs no repairing or painting—especially if he has had experience with an old time roofing.

The bare fact that Asbestos "Century" Shingles are made of reinforced concrete is a convincing argument in itself. There's no getting away from the permanence of reinforced concrete—the tests it has stood in every climate, the disastrous fires and the centuries of time.

You will find proof of the durability of Asbestos "Century" Shingles all over America and Europe on thousands of buildings of all types—residences, public buildings, and industrial plants.

Asbestos "Century" Shingle Roof—Somerville Hospital, Somerville, Mass.; W. P. Leavitt Sons Co., Newton, Mass., Contractors

They are the first practical lightweight roofing of reinforced concrete—made of hydraulic cement with interlacing asbestos fibres—compacted by tremendous pressure.

Asbestos "Century" Shingles are weatherproof—fireproof—timeproof. Cannot rot, rust, crack, split or blister. They literally outlive the building—without repairs.

You can get Asbestos "Century" Shingles in shapes and sizes to fit any architectural scheme. Three colors, Newport Gray (silver gray) Slate (blue black) and Indian Red. Ask your roofer for new quotations. Write for booklet "K & M 1910."

TRADE REVIEW

A GOOD CARPENTER SHOP AND FARM TOOL.

A new grinder, made of Carborundum, the abrasive which is said to be displacing emery wheels and other grinding wheels in all large manufacturing plants, is now being offered. At experiment stations, where this grinder has been tried out, it has given the utmost satisfaction, and in a very short space of time it has sprung into very pronounced popularity. This popularity is due to its perfect fitness for carpenter shops and farm tool equipments, and to the fact that all the grinding and polishing wheels are made of Carborundum.

Carborundum is made in a mammoth furnace at Niagara Falls from the same elements that go into the making of diamonds; it is 25 times as hard and will cut 25 times as fast as the ordinary grindstone. It cuts into the hardest steel, as if it were chalk. No matter how long it is used, a Carborundum wheel never becomes smooth or has to be dressed, as other wheels must. Mower sickles, plow shares, cultivator blades, scythes, axes, corn knives, kitchen cutlery, chisels, hatchets, pocket knives—in fact nearly every tool used can be sharpened and polished bright as new, on the Luther Grinder. It has nine Carborundum sharpening devices and three other attachments.

Carborundum is made in large electric furnaces at Niagara Falls. This new substance has all the chemical properties of the real diamond—the immense electric energy developed at Niagara Falls makes the manufacture of it possible and now within the reach of all. At first it sold at $550.00 a karat. The mechanical world recognizes it as the greatest sharpening substance in the world.

The Luther Grinder Manufacturing Company, 55 Madison St., Milwaukee, Wis., are the oldest and largest makers of grinders in the world and they give a five-year guarantee on this machine. In putting this machine out they have announced that it will be sent to a limited number in every locality on free trial, merely to secure universal introduction as quickly as possible. The offer made by the Luther Grinder Company is very liberal, and as many of our readers are already acquainted with the Company, on account of several years of previous advertising in THE NATIONAL BUILDER, it is safe to say that a large number are already using this grinder and are perfectly satisfied with them. Those who have never tested the merits of this good grinder, can easily do so now with every assurance of liking it.

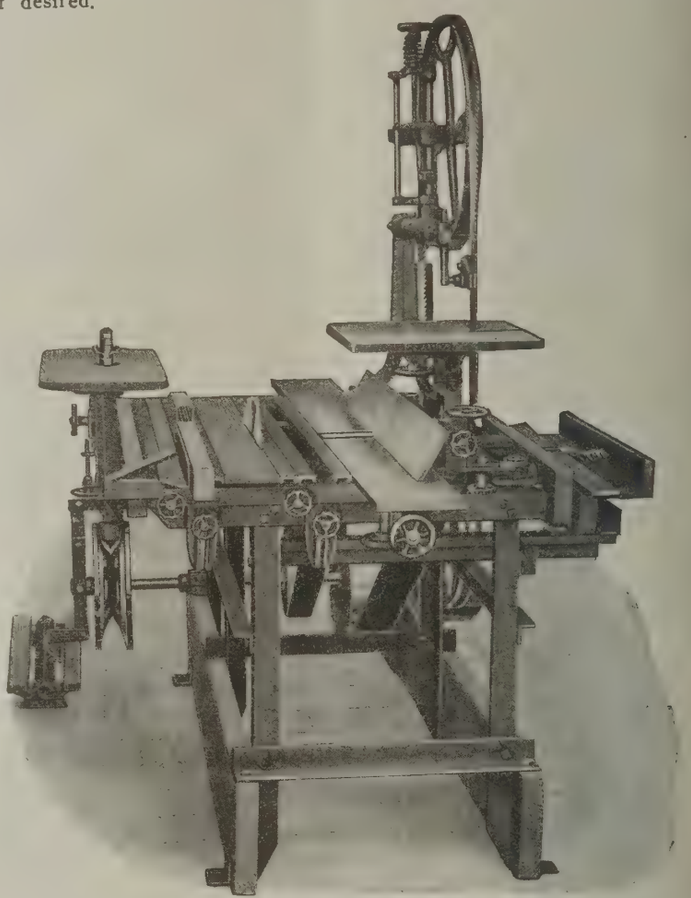
THE MILKS FRAMING INSTRUMENT.

The Milks Framing Instrument is claimed by the manufacturers to be one of the most remarkable and wonderful inventions in the building field. The claims for this framing instrument are as follows:

It will do the figuring work instantly and with absolute accuracy without mental calculation; gives the length and cuts of hips, valleys, common rafters, jacks and cripples, on any width of building or any pitch of roof, roofs out of square or different pitches of roof; figures stairwork in all its branches, straight or circle, giving the proper number of steps to go in the space; the exact width of treads and rises and all other measurements necessary; divides distances, figures octagons, circles and braces of all kinds. It can be used by anyone who can read and write. It lasts a life-time. In nineteen seconds it will do the work that it takes an ordinary mechanic from two to three hours to accomplish. It will give the answer to puzzling problems, even to a fraction, in less time than it would take to get pencil and paper ready, preparatory to figuring them out. Gives correct answers quickly and accurately, thereby saving expense, worry and mistakes. It is the only instrument ever invented that figures stairwork with absolute accuracy, giving the proper number of steps, and the exact run and rise of each.

Mr. Milks, the inventor of this instrument, also claims that lengths of all rafters used in the construction of building could be figured in less than one minute. In proof of this statement a test was made that demonstrated his contentions were correct.

The signed statement which follows is a copy of the original on file at the office of the Parsons Mfg. Company:



"We timed Mr. Milks in giving the answer to the following problem: What would the lengths of all the rafters be for a hip roof to be placed on building 26 ft. 8 in. square? In 30 seconds Mr. Milks gave correct answer to the problem, including lengths of hips, jacks and common rafter. Geo. S. Lynd, Pres.; J. H. Kent, Treas.; P. A. Morrison, Rec. Secy.; S. A. Speas, member, U. B. of C. & J. of A., Local No. 1022.

The Milks Framing Instrument is manufactured by the Parsons Manufacturing Company, Parsons, Kas, who also manufacture the Milks $1.00 Pocket Miter Box. Reading matter fully describing both framing instrument and miter box will be sent on request.

PARKS COMBINATION WOODWORKING MACHINE.

One of the latest additions to the already extensive line of woodworking machinery turned out by the Parks Ball-Bearing Machine Co., Knowlton and Fergus streets, Cincinnati, Ohio, is the combination circular saw, 6-inch jointer, band-saw and reversible spindle shaper with boring or mortising and rabbeting attachments, which we show in the accompanying illustration. The machine is really six in one, and cannot fail to prove interesting to carpenter contractors, builders and others operating woodworking shops. The frame is made of extra heavy angle iron strongly braced and securely bolted together. It is mounted on a long, substantial base, which it is claimed greatly increases the steadiness of the machine, as it gives more foundation and distributes the strain over more of floor space. The length of base is 4 feet, 2 inches, and the width 24 inches.

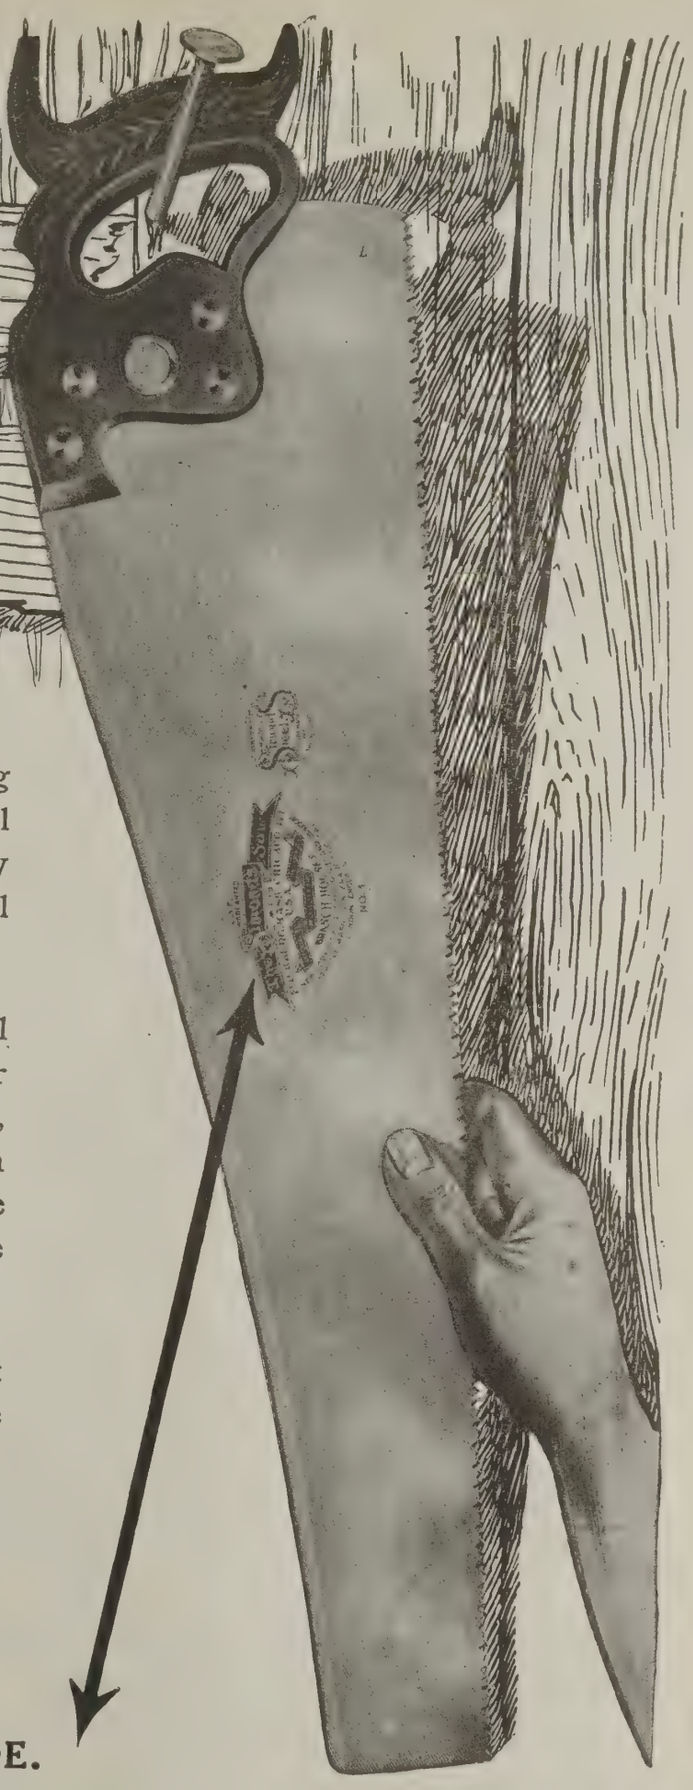
The saw table is made of heavy iron and channel steel and the top surface is finished by grinding on special machine. The hight is 2 feet, 10 inches, the width is 22¼ inches, and the length, 3 feet. The heavy angle steel on each side makes a substantial support to which to bolt wood extensions any width or length desired. The shaper spindle is made to reverse by means of two friction disks which slide on the countershaft and driven with a key in the shaft. The table is raised and lowered by means of a hand screw in order to adjust the depth of the cut. It is furnished with shaft, bearings and pulley so that it can be used independent of this machine if desired.

PARKS COMBINATION WOODWORKING MACHINES.

The jointer has hand-wheel incline adjustment for both front and rear plates. The band saw has all the necessary adjustments and tilting table. The machine will do ripping, cross-cutting, band sawing, boring, planing, straightening, squaring, beveling, grooving, rabbeting, etc. The machine is equipped with a 22-inch band saw set in the rear wheel. The boring attachment has adjustable sliding support and takes bits with ½-inch straight shank.

THE CANTON ART METAL COMPANY'S CONVENTION.

Progressive business concerns are alive to the benefit that comes from the free exchange of ideas among their business associates and employees. This fact has led the Canton Art Metal Company of Canton, Ohio, to hold conventions at stated times to promote the interests of the salesmen, the employer and the trade. In a handsome souvenir program the company announce their second annual Sales Convention of branch houses and representatives held at the main office, December 27 to 31.



This convention was attended by some thirty representatives. The portraits of a number of these, besides views of the company's extensive plant, appear in the souvenir. It is evident from the portraits that the company's organization embraces a force of men of high efficiency.

During the thirty-four years of the company's existence the products have increased from the more common lines to include metal furniture and filing devices, embracing office, bank, court house, library, school and vault equipment; improved metal ceilings, side walls and wainscoting; cornices, skylights, ventilators, crestings, finials, ornaments, building fronts and special work; formed and roll roofing, siding, shingles, paints, sheet copper, zinc, black sheets, galvanized sheets, corrugated sheets, "Toncan" metal, tin plate, tin roll roofing, solder; eaves trough, gutter, ridge roll, conductor pipe, formed valley, conductor heads, cut-offs, elbows, hangers.

As the lines manufactured were multiplied and found to meet the approval of the trade, increased facilities for manufacture were necessary, and although the plant is now extensive in size and equipment, plans are under way for a still further enlargement. The company has always followed the policy of making quality the first consideration, and attributes much of its success to this practice.

The company's metal ceiling with punched nail holes and repressed joints has had a sale beyond all anticipations. The metal furniture department is equipped to handle all contracts. Among the contracts on hand for this line are entire equipments for many court houses.

Simonds Saws

THE very first step taken toward making a Simonds Saw—the making of the steel—is specialized under a Simonds Process. By it we produce Simonds Special Crucible Steel—for Simonds Saws only.

No other process produces a better steel for Saws. It is tough, flexible, with a temper taking quality that makes it when treated, tempered, ground, finished, and made into a saw blade, in the Simonds way, in the Simonds shops, the best saw that can be bought at any price.

Another thing: should even the slightest defect crop up in a Simonds Saw, while in the process of making, that condemns it to the scrap heap. Remember you can always be sure of buying high grade quality when you buy a **SIMONDS.**

To buy the right saw, let it be rip, hand or panel, see that the Simonds (Si-monds) name is on the **BLADE.**

Let us send you a free copy of Simonds "Guide for Carpenters." Tell us what kind of a Saw you will need soon.

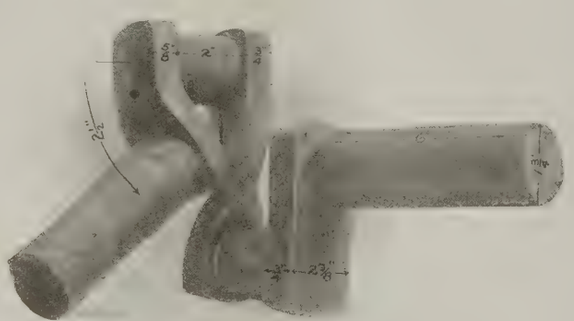
VANADIUM STEEL SAWS AND MACHINERY.

BY GEORGE E. LEES.



TYPE "H" VANADIUM STEEL SAW WITH BLADE COILED.
After remaining thus for thirty days, the blade was released, and returned to perfect alignment.

Ten years of the new century have just closed. Looking back over the accomplishments of its first decade, we can credit it with more wonderful and useful results than have ever come to us before in the same period of time. The automobile has been made practical for business and pleasure; wireless telegraphy has linked the intelligence of ships with ships and land over miles of empty space; radium has been harnessed into useful service and the age of steel has been revolutionized by the application of a new element, Vanadium.

Ten years ago the metal Vanadium was a curiosity of the laboratory; it was used in a small way for tinting glass and giving beautiful colors to expensive porcelain. It was first discovered in a piece of remarkably ductile and excellent Swedish iron that had been made from the ores of Tabert in Sweden. It was also found in these ores, but in very small quantities. Owing to the extremely high melting point of Vanadium, it could not be introduced directly into steels and irons during the process of manufacture, but it was soon found that an alloy made of one part Vanadium and two parts of iron melted very readily and could be dissolved in molten iron and steel in the crucible or the open hearth furnace. Irons and steels of the most remarkable qualities resulted, but the supply of Vanadium was so small that Vanadium steels could not be placed on the open market.

Some five years ago, however, the engineers of the American Vanadium Company of Pittsburg located a rich and extensive Vanadium deposit about three miles up the Andes mountains in Peru, and a factory was built near Pittsburg for the commercial reduction of the ores and the manufacture of a suitable alloy known as "Amervan" Ferro Vanadium.

BENT UNDER 2,500 LB. STEAM HAMMER BY REPEATED BLOWS WITHOUT ANY SIGN OF FRACTURE. A HIGH GRADE ORDINARY STEEL FAILED UDER THE SAME TEST.

A revolution in steel then began and the results today are little short of amazing. Before the period of Vanadium steel, a one-inch square steel bar could scarcely be made to support a vertical load of 100,000 pounds,

ONE INCH BAR OF VANADIUM STEEL TIED INTO A KNOT COLD. ELASTIC LIMIT 100,000 LBS.

but today Vanadium steel bars of this size can be seen holding weights of 225,000 pounds.

Vanadium steels have been very largely employed in railroad and automobile work; locomotives are now built around Vanadium cast steel frames, with Vanadium iron cylinders and all the forged parts of Vanadium steel.

The advantages of using small quantities of Vanadium appear in the remarkable increase of strength and elasticity given to the steel and in the fact that Vanadium steel won't crystallize or "get tired" and break unexpectedly. It is not brittle and possesses the most surprising wearing qualities.

About three years ago the American Vanadium Company made some carpenters' saws and had them coiled up and locked with a steel band as shown in the engraving. After thirty days one of the saws was released and returned to a perfectly straight line; after a year another was released and showed no signs of curvature. The same result was obtained after two years with a third saw and the one shown in the engraving is going on its third year and will be released in Atlantic City at a large convention next June.

One of these Vanadium saws taken at random was bent from point to handle in both directions and returned to its original condition. Two twenty penny steel spikes were then driven in a plank and the plank was sawed in two, straight through the spikes, without any perceptible injury to the teeth. After that a 2-inch steel gas pipe was sawed in two pieces by the same saw. With a hammer one of the teeth was then bent at right angles to the blade, and then again bent in the opposite direction till it came to a right angle, when it was returned to its proper position unharmed. In sawing concrete molds covered with cement, this saw has a record of two weeks against an ordinary saw's three days without resharpening.

The demand for Vanadium steels in railroad and large engineering work has been so great that its use in small tools has been somewhat neglected, but with this surprising proof of the absolute superiority of Vanadium steel over all other types of steel, the carpenter and builder has now come into his own and is able to hold a saw that saws.

[Editor's Note.—Mr. Lees' address is 324 Frick Building. On request, Mr. Lee will mail full particulars about Vanadium steel, hand saws, etc., and will also place your name on his list for a free copy of a new book he is making up on the subject.]

THE ASHLAND FOLDING SCAFFOLD BRACKET.

Everyone knows that in placing a new building device or material on the market the manufacturer generally find his hardest work in making sales right at home among his friends. So when he does find his friends coming to him and ordering the new folding scaffold, and that is what this article is about, it is a pretty good indication that the buyer is getting the best. When re-orders are placed again and again by the first customers, it is a stronger indication that the folding scaffold has unusual merit. The Ashland Folding Scaffold Bracket, although only on the market a short time, is used by nearly all the carpenters and contractors in the city it is manufactured in. The makers claim unusual strength for it, unusual convenience in folding up and taking from job to job and it is especially easy to put on any kind of siding, without

SHOWING ASHLAND FOLDING SCAFFOLD BRACKETS IN USE ON SIDES AND FOR CHIMNEY WORK.

damaging it. The Ashland Folding Scaffold Bracket is made of metal, and is folded and unfolded instantly without the use of pins or bolts. Each bracket weighs only 17 pounds. No holes are bored in the siding, but instead just drive four ten penny nails and it is claimed that each bracket will safely hold up at least 1,000 pounds. When placed upon the siding the Ashland Bracket is so arranged that swaying or wiggling of the scaffold from side to side is impossible. While the bracket is especially adapted for carpenters' use, it is said to be the most practical bracket made for painters. tinners, and brick masons. For scaffolding on the roof for building chimneys, etc., they are also most useful.

A special discount is being made on this bracket to introduce them in every town. The manufacturers are the Ashland Folding Scaffold Company, 17 Washington st., Ashland, Ohio.

The guarantee given by the Company on their bracket is very liberal. Circular "N" will give further particulars and prices will be quoted also when writing for it.

How a New York Contractor Made a Barrel of Money on 150 Suburban Houses!

The Gordon-Van Tine Catalogs OPENED HIS EYES!

Here's just **one example** of the way our business grows. A New York Contractor, conducting extensive building operations in the suburb of Far Rockaway, Long Island, noticed an advertisement of the Gordon-Van Tine Co. of Davenport, Iowa, offering high-grade, guaranteed Millwork, Lumber and all other Building Material—**direct from the mill**—at a big saving over retail dealers' prices. It interested him. He wrote for our Catalogs. When they came, the low prices opened his eyes to the enormous savings offered.

Comparison of Our Prices With Local Dealers' Made Him "SIT UP AND TAKE NOTICE"

He said to himself, "Great Scott, if there's as big a saving as that, **me for Gordon-Van Tine!"** He made careful comparison of our quotations with the prices asked **on the same class of stuff** by local retail lumber dealers and millwork men. He decided to risk a trial order, as he found our bank references O. K. and our rating in Dun and Bradstreet satisfactory.

Sent Us a "TRIAL ORDER"—Goods Shipped Quick and Proved to be HIGHEST QUALITY

We filled the order in the usual way—**promptly, carefully, conscientiously.** We didn't know he had "150 houses up his sleeve." It wouldn't have made any difference even if we had. The contractor was delighted with our stuff.

It was not only better than he expected, but everything came through "shipshape"—due to our extreme care in packing.

He saved so much money on the "trial order" that he felt like he had tapped a "pay streak."

Orders Material for 150 HOUSES and Becomes a STEADY CUSTOMER of the Gordon-Van Tine Co.

The pictures at the top show the class of houses which this wide-awake contractor built from our materials exclusively.

He made a barrel of money on those 150 houses and is a steady buyer of our materials. There are over half a million fellows throughout the country who have also "seen a great light" out in Iowa.

Honestly, MR. CONTRACTOR, Why Not Investigate?

Our immense concrete warehouses are packed and with bargains in sash, doors, millwork, stair and porch material, flooring, roofing. Everything ready for quick shipment anywhere; **quality, safe delivery and satisfaction guaranteed.** Get the Free Catalogs. Compare prices, note the big saving, and send us a **trial order.**

GORDON-VAN TINE CO., 555 Federal Street, Davenport, Iowa

OSHKOSH PORTABLE SAW RIG.

The Oshkosh Logging Tool Company of Oshkosh, Wis., are manufacturing a portable rip and swing cross saw rig, which will be of interest to our readers. This machine is manufactured with either a gasoline engine or electric motor for power and is mounted on heavy hardwood skids, so bolted and mortised together as to afford a base practically as solid as a permanent foundation, thus insuring perfect and permanent alignment of shaft, boxes and belts, an extremely important consideration in the constitution and operation of a portable saw rig.

The machine part of this rig, it is claimed, is the only one of its kind on the market today, and is fully covered by patents. The feature of this machine is the swinging arbor which is made to swing for cross cutting and held rigid for rip sawing and is controlled by a lever on the side of the machine. A lever is placed in a suitable position for operating the saw when cross cutting. These machines are equipped with sliding scale for sawing various widths, also miter device for all kinds of miter sawing. The saw is covered by an adjustable saw guard which may be set to any height. Iron saw tables are made amply large enough. Attached to the iron tables are two side tables which make the sawing of long and heavy lumber much more handy. A hook is fastened on each end of the skids which allows the handling of this rig by team of horses and may be hauled to any desired place.

The portable saw rig is made in two sizes. Size No. 1 carries 14-inch saws and weighs 1,800 pounds and has a 6 horsepower gasoline engine; with the same saws and with a 5 horsepower electric motor weighs 1,400 pounds. Size No. 2 carries 20-inch saws with a 10 horsepower gasoline engine, weighs 2,400 pounds; with the same size saws and 10 horsepower electric motor weighs 1,600 pounds.

Contractors will find this machine a great help to them as they may haul this machine to the place of construction. As a letter below states, it has done the work of six carpenters in one day. This machine can

OSHKOSH SAW RIG.

also be used to great advantage for contractors in the construction of concrete forms. Retail lumbermen have been using this machine to a large extent in their yards for sawing up broken, warped and defective lumber and have found it to be a money maker in their line of business. With this saw they cut out the bad places in the lumber, thus turning a low grade of lumber into a more profitable grade which would ottherwise have gone into the waste pile.

We print below a letter from the Deatherage Lumber Company, which we think fully backs up this statement. The following will give a good idea of the high qualities and money making advantages of the Oshkosh portable saw rig:

Sioux Falls, S. D., September 26, 1910.

Oshkosh Logging Tool Company, Oshkosh, Wis.

Gentlemen: In reply to yours of the 23d would say that we have one of your portable saw rigs on this job.

We have ten buildings here on this contract for the John Morrell & Co. packing plant, most of which are reinforced concrete.

We would say that we have a carpenter and a helper on this saw and that they work practically eleven hours every day. We have never lost any time on this work on account of the saw rig being out of order except from changing dry cells.

We can recommend this machine as a money saver on any job, large or small, and would say that if we had this job to do over again that we would buy two.

A carpenter and a helper on this saw easily do the work of six carpenters. Thus you will see that we consider this machine has already paid for itself on this job, although it is yet as good as new.

We can heartily recommend this saw rig to all contractors as it fills a long-felt want in our business.

Yours truly,
COLLINS BROS., General Contractors,
Office, Rock Island, Ill.

A Copy.

Chicago, October 4, 1910.

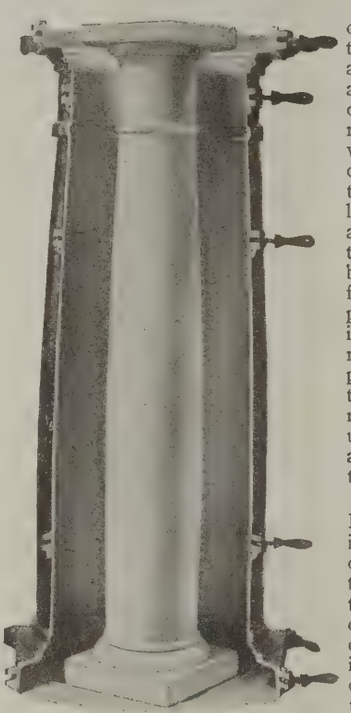
Oshkosh Logging Tool Company, Oshkosh, Wis.

Gentlemen: Replying to your letter of September 23, would say that the portable saw rig purchased from your company some six weeks ago and placed on our work at Kansas City has given excellent service and has proven its efficiency under all conditions.

Yours truly,
GEO. B. SWIFT COMPANY,
General Contractors.

Kansas City, Mo., December 5, 1910.

Oshkosh Logging Tool Company, Oshkosh, Wis.



Gentlemen: We are in receipt of yours of December 13 and are pleased to inform you that the portable saw rig has been in operation since September and the saving in time and the utilization of what would, without the use of the machine, be waste or low grade material, has been a source of constant satisfaction and profit to us.

In one day it saved us the net amount of twenty-two dollars ($22). It has been operated throughout by the regular yard force, among whom there is not one making any pretention of mechanical knowledge.

Yours very truly,
DEATHERAGE LUMBER COMPANY.

The Oshkosh Logging Tool Company, Oshkosh, Wis., manufacturers of this portable saw rig, have been making a high quality of logging tools for over twenty-five (25) years, and their reputation in financial standing is such that contractors and lumbermen are assured of the fairest treatment. They guarantee their saw rig for good hard usage and plenty of it, and they will replace any parts that may be defective one year after delivery. A catalogue, fully describing and illustrating their rig, will be mailed upon request.

HOOSIER COLUMN MOLDS.

The tendency of the property owner is to have not only an attractive home, but one that has as many conveniences for comfort as possible. The roomy veranda or porch, is rightfully becoming more popular every day. When well designed and built, the veranda or porch should add to the attractiveness of the house. The Colonial Column is being specified and used in nearly every part of the country by owners desiring a building material which seldom fails to add greatly to the fine appearance of the home. The Hoosier Molds now being placed on the market by the Hoosier Mfg. Company, Goshen, Ind., will give contractors and cement workers a mold which makes a Colonial Column of cement, complete with top and base, without flutings or sections, all in one solid piece.

The Hoosier Porch Column Mold makes a column 54 and 60 inches high. The top is nine and one-half inches; base, eleven and three-quarters inches square and the diameter is nine inches. Two or three of these cement columns can be made each day with a Hoosier mold. The Hoosier Mfg. Co. claims that a cement Colonial Column made in their mold retails from $3.50 to $7.50 each. The cost of manufacturing is said to be 50 cents, or where made of Medusa Portland cement and White Silica sand about $1.00. Only two buckets of cement, five buckets of sand and one hour's time is required for each column. From this, it presents a very attractive proposition as a money maker, for the man who wants to manufacture his own porch columns, or for the cement workers who desire to make them to sell. Everyone knows that a well made cement column has many advantages—and there ought to be a ready market for cement colonial columns. The Hoosier Mfg. Co. gives a very strong guarantee on their molds, and one that is worth investigating, especially as the price seems mighty reasonable.

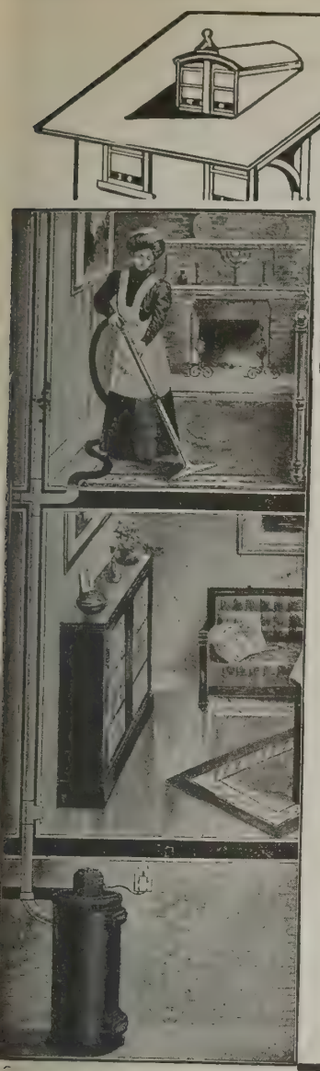
THE NEW IMPROVED SEBO SCREW ANCHOR.

A radical departure from the usual run of fixture fastening devices is now being put on the market by the Star Expansion Bolt Company, of 147-149 Cedar street, New York City, makers of the famous Star Expansion Bolts.

The Sebco Screw Anchors, constructed on an entirely different principle than the star Screw Anchor, consists of a lead composition, anchor corrugated and cut in the form of a star at the screw end.

This star adds to the inner expansion and is also a formidable preventative against the fracturing of the two jaws.

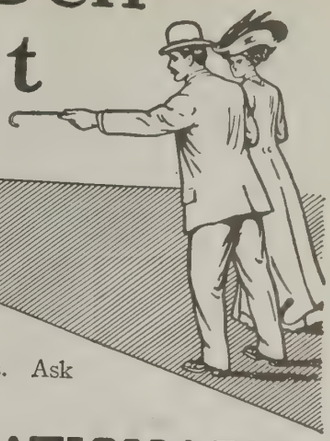
In the old types a too great expansion would quickly split the jaws. The Sebco also allows a deeper and more even expansion.



Free samples and a beautifully bound 70-page catalogue will be mailed to any inquirer addressing catalogue department 30.

PATENTS.

976,777. Gravity sash-lock. Edw. N. Brown, assignor of one-half to J. R. Peterson, and one-half to J. M. Bostick, Canton, Ohio.



976,652. Device for handling cement blocks. R. L. Hensley, Terre Haute, Ind.

976,182. Reinforced concrete column girder and beam. John A. Jones, Cincinnati, Ohio.

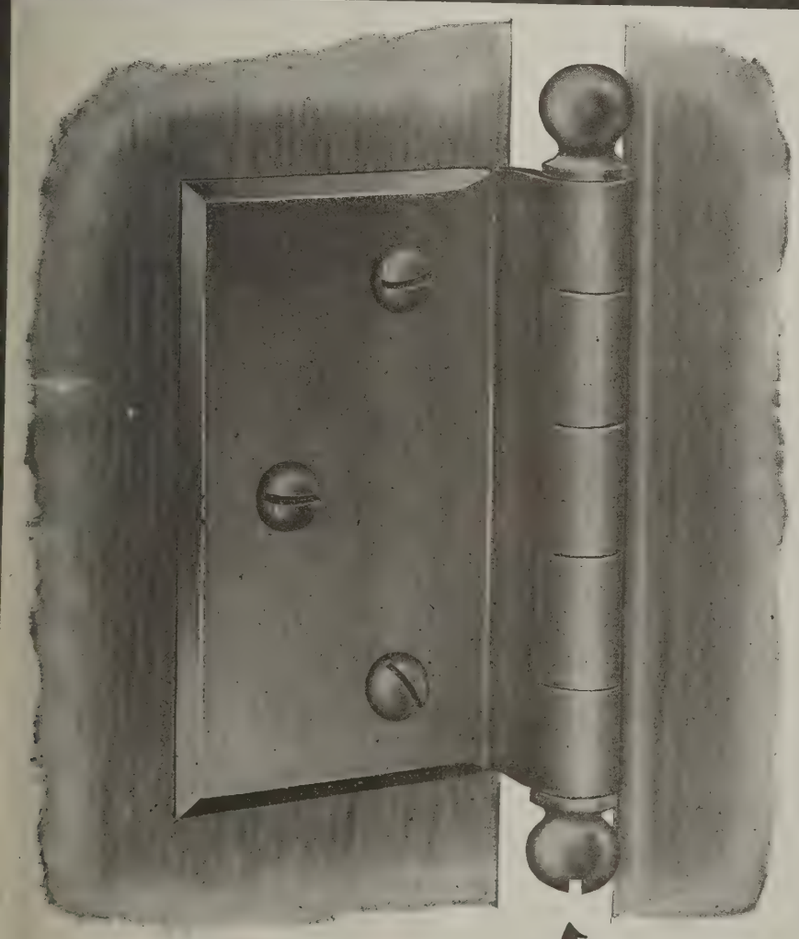
Helps you Sell or Rent

It is conveniences that count.
Add to the lighting, heating and plumbing systems in your houses a cleaning system of equal efficiency and convenience and you'll have more people after them and at better prices. Ask now about the

TUEC-170 STATIONARY Air Cleaning System

The illustration shows how it is installed. To clean any room attach end of hose to pipe-opening on that floor, press the electric button and a suction of 170 cubic feet or 300,000 cubic inches per minute draws in all the coarse dirt and all the fine dust from carpets, curtains, walls, etc, and all the germ-laden air from the house.

Down the pipe it goes to the cellar, the dirt remaining in the machine, the tainted air passing through the chimney-flue outdoors. Complete with aluminum tools for every purpose.



Not a rotary or diaphragm pump system but a powerful centrifugal fan protected by patents owned by The United Electric Co. No complicated parts to make trouble or wear out. Absolutely guaranteed.

Easy to install in any house now built or under construction. A great investment—increases the value of your property far more than the cost of the system. **Write today for free booklet.**

THE UNITED ELECTRIC CO., 3 Hurford Street Canton, O.

Agencies in All Large Cities

We make larger sizes of the TUEC Air Cleaning Machines for hotels, schools, apartment houses, public buildings, etc. Write for further information.

LADDER ELEVATORS.

Masons, stucco workers and painters should be interested in ladder elevators shown in accompanying cut. For working on stucco houses particularly they are practically invaluable. Every contractor knows how much it costs to scaffold these houses. Using the ladder elevators, a couple of men can erect their scaffold and be at work on it in ten minutes. Afterwards they can raise or lower themselves by easy stages, at will, for the elevator can be operated either from the ground, from the scaffold, or any place nacessary on the ladder; it locks automatically and positively every foot.

On stucco houses the scaffold must not touch the work for fear of marring; just the narrow steel brace touches the house, and that at two points only. A broad, comfortable platform is provided for the workmen to stand on, and the second narrower platform holds tools and material within easy reach. This is a great help in getting work done quickly and well, for it saves strength as well as time of the workmen, in that it takes away the necessity for stooping down from time to time, which is the heaviest part of the work.

A scaffold erected on a pair of these elevators is absolutely safe. There is nothing about them to break or get out of order, and with proper care they will last a lifetime. The runways of channel steel more than double the strength of the ladders, and there is no strain on the rungs, for they are used for support. Elevators are run on and off while ladder is up, and after removing two wing nuts they can be folded for shipment.

Contractors who study into it will quickly appreciate the returns possible from an investment in this equipment. With these elevators in a given time a man will do several times the work possible from any other kind of scaffold.

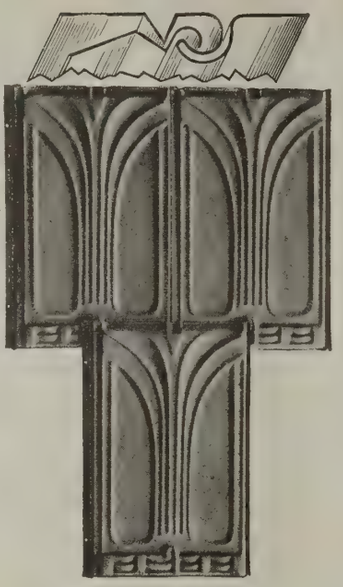
James L. Taylor Manufacturing Company, the manufacturers, at Bloomfield, N. J., will be glad to furnish full particulars and prices on request.

A GREAT TRIUMPH FOR CABOT'S SHEATHING QUILT.

The North Pole having been discovered by an American, other nations are hatsening toward the South Pole. From England Capt. Scott sailed last June on an expedition which has been carefully planned to follow up the great progress made by Lieut. Shackleton, and from Japan another start has been made.

Capt. Scott has the most complete outfit ever carried on such an expedition, including ice-automobiles and especially made portable houses which can be quickly set up to protect his men from the terrible cold.

These two items were worked out under Capt. Scott's personal supervision. The houses must be as absolutely cold-proof as possible, and yet must be light in weight for ease of handling. After careful investigation Cabot's Sheathing Quilt was chosen for insulating these huts. and the illustration shows a truckload of Quilt on its way to the steamer for shipment to England for this purpose.



Some Comments of the English Press Follow:

"The British Antarctic Expedition.—As a protection against extremes of temperature, the living huts and observatory for Capt. Scott's Antarctic Expedition. all of which were made by Messrs. Boulton and Paul, of Norwich, have been lined throughout—walls, floors, and roofs—with two layers of the double-ply Cabot's Quilt." —London Times, June 29, 1910.

"It is interesting to learn that the living huts and observatory for Capt. Scott's Antarctic Expedition have been lined with two layers of Cabot's double-ply Quilt. This is a fine feather in the cap of Arthur L. Gibson & Co., of Twickenham, by whom the Quilt was supplied.—The Architect (London), July 1, 1910.

"We have been informed that the living huts and observatory of Capt. Scott's 1910 Antarctic Expedition have been lined throughout with two layers of the double-ply Quilt.—The Engineer (London), August 26, 1910.

NEW INTERLOCKING AJAX SHINGLES.

The Edwards Manufacturing Company have a new metal shingle that they are placing on the market, known as "Edwards Interlocking 'AJAX,'" and which promises to be as popular among architects, carpenters and property owners as Edwards Spanish Tile and their other metal roofings.

The particularly perfect embossing and sharpness of pattern makes this shingle unusually attractive. The manufacturers claim it is the most perfect metal shingle on the market.

The Interlocking Device, which provides for expansion and contraction and conceals all nails from the weather. These shingles, when properly applied, are absolutely guaranteed to be wind, weather, storm, fire and lightning proof. The patented Interlocking Device is so constructed that it is impossible for the hardest rain or driving snow to penetrate. They are manufactured from best quality Worcester Grade Terne Plate, furnished painted or galvanized (regalvanized after formation, size 10x14 inches.

The universal use of Edwards Interlocking "AJAX" metal shingles would prevent, it is claimed, such disasters as the Chelsea conflagration, and at the same time give the property owner a very attractive roofing material.

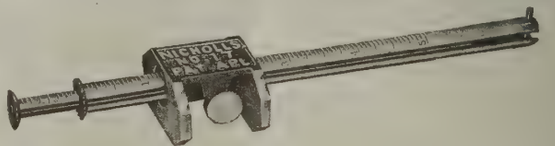
Full particulars, prices, etc., can be had by writing the Edwards Manufacturing Company, 430-450 Eggleston Ave., Cincinnati, Ohio.

RICHARDS-WILCOX MANUFACTURING CO.

Thousands of practical builders are now acquainted with the Richards Manufacturing Company's line of trolley hangers. But not many know that scarcely more than a half a dozen years ago this company employed only a few men, had a very small plant and was competing against larger and stronger companies.

The Richards Manufacturing Company have just announced the consolidation of their interests with the Wilcox Manufacturing Company, making door hangers, etc. The business will be conducted under the name of the Richards-Wilcox Manufacturing Company, with the following officers: W. H. Fitch, president and general manager; Lee Mighell, vice president; Milton D. Jones, secretary and treasurer; P. L. Hoffman, superintendent.

From the small beginning made about six years ago, this consolidation is a fitting climax of an unusually rapid and substantial growth developed strictly upon the merits of a type of trolley hangers for barns, warehouses, garages and residence doors which is said to have no equal.



Richards trolley hangers are easy running, easy to put up and adjust and do not jump the track. They have proved so satisfactory to architects, contractors and property owners that hardware dealers all over the country carry, as a rule, the complete line.

A great deal of attractive and instructive literature will be sent out to builders wanting full details on door hangers. The location of the factories and office of the Richards-Wilcox Manufacturing Company is Aurora, Ill.

NEW MARKING GAUGE WITH SAWTOOTH WHEEL.

The Nicholls Manufacturing Company, Ottumwa, Iowa, are placing on the market a new improved Roller Marking and Mortise Gauge, called the "Nicholls No. 17 Sawtooth."

This gauge is made entirely of metal, nickel plated or white metal finish, double faced and has a sawtooth wheel at end of both bars in place of a pin or straight roll. This makes a gauge which will not run out with the grain of wood. The tracing wheel runs true with edge of board, regardless of knots or cross-grain wood.

This is claimed to be the only gauge on the market which will mark true at all times.

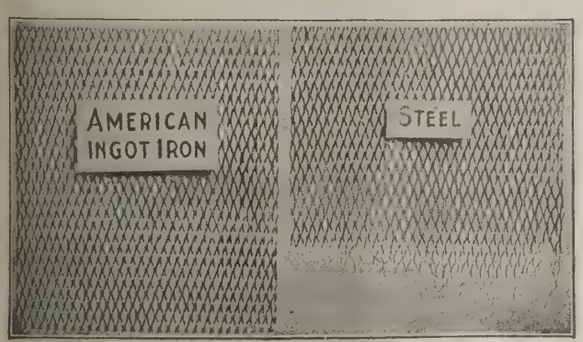
Another feature is, the line made by a pin is very hard to see on some kinds of wood, but with this true gauge the marks made are like punch marks, and reflect the light from all sides.

It is also made so that one rod slips inside of a hollow tube, making the same appearance as a single gauge; and, by slipping the inner rod out, you have a perfect single marking gauge. Both rods are graduated. Very near the end of the outside rod they have placed a steel point pin to admit of being used close up into a rabbet or corner.

This gauge is strongly made and will last a lifetime and will be found a desirable addition to the carpenter's kit of tools.

It actually costs less to lay a Slate Roof and to **keep it in perfect condition** during the whole life of any building—than to get similar results with any other roofing material.

Sea Green and Purple Slate



is the toughest and best roofing slate ever quarried. It is easy to handle—easy to lay—outlasts any building. Its first cost is the only cost—there are no paint bills—no repair bills. It is fire-proof—lightning proof.

Let us give you the **proofs**—tell you why it will pay you—how it will please your trade—and send you our book "Roofs" giving interesting facts on comparative roofing costs and values. All free for the asking.

American Sea Green Slate Co.

How About YOUR ROOFS?

—be they NEW or OLD, Ready-to-Lay

Burmite

FLEXIBLE-CEMENT-BURLAP INSERTED MATERIAL

(PATENT APPLIED FOR)

WILL BE FOUND NOT ONLY

THE MOST DURABLE AND INEXPENSIVE BUT THE HANDSOMEST AND MOST PRACTICAL

FOR THE

ROOFING AND SIDING

Of Factory, Residence and Business Buildings, Churches, Warehouses, Summer Homes, Bungalows, Outbuildings, Garages, Barns, Etc.

MADE IN TWO SURFACES—

BIRD-SAND and *"Twolayr"* SLATE-CHIPS

TO MEET EXTREME WEATHER CONDITIONS

Sparks, Hail, Sleet, Sliding Ice, Rain, Snow or the **Extremes** of Cold and Hot Weather do not affect the **Storm-Resisting** and **Fire-Retardative Qualities** of BURMITE.

CAN BE APPLIED IN COLD WEATHER

For the *"Twolayr"* **Slate-Surfaced Material,** Natural colored Slate of **Unfading Quality** is used, the fine slab-shaped Slate Chips being imbedded into the **Pure Asphalt Composition** so thoroughly—**and put there to stay**—that a smooth, even upper mineral surface (there being two layers of the Slate Chips) is the result, thus securing the well-known **imperviousness and Weather-Resisting Qualities of Slate, at One-fourth the Cost.**

2 Permanent Natural Slate Colors—SLATE-RED and SLATE-GREEN

Uniform Solid Slate Surface Requires no Painting Kept Clean and Bright by the Rain

*Natural size of the Slate Chips

DURABLE ECONOMICAL ARTISTIC

A **practical roofer, with thirty years' experience** in selling and applying other makes, **recently used our BURMITE for roofing his own building**—which, by the way, was a **flat roof**—although he had on hand at the time a large stock of the other kinds he had been selling. In speaking of the many advantages of "Burmite," he writes us:

"It is not necessary to take off your shoes for fear of damaging the storm-resisting and fire-retarding surface of a "Burmite" Roof—the strongest and most durable made."

THE BEST BY TEST

SOLD ON ITS MERITS AND LASTING QUALITIES. THE FIRST COST—THE ONLY EXPENSE.

As a rule, other grades must be coated at least three times in seven to ten years; and if the cost of paint and labor is added to the original cost of the material and applying, it will be at once apparent that "Burmite" will be found not only the **Most Durable** but **More Economical than others.**

Architects, Contractors, Builders, Roofing Experts, Owners and Occupants will find our **Samples and Booklet,**

"BURMITE QUALITY COUNTS"

Illustrated with buildings, beautifully printed in colors, showing effect of BURMITE MATERIAL, **applied** as a Roofing and Siding, both interesting and instructive. Mailed free of all charges and obligation. WRITE TODAY.

UTILITY WALL BOARD.

The contractor or builder visiting Chicago who is fortunate enough to see the process of making Utility Wall Board will go away convinced that the day of lath and plaster is limited. While wall board will not take the place of lath and plaster at once in certain kinds of buildings, still it can be used to splendid advantage even now in a great many places and in rooms of the finest residences. Its use in both new building and repair work is now acknowledged to be growing at a rapid rate. Utility Wall Board is made in sheets 30 inches wide and 8, 9, 10, 11 and 12 feet long. It is claimed to be cheaper and better than lath and plaster. Wall board can be put on by the most inexperienced workmen in a very satisfactory way. Carpenters, however, are especially fitted to get unusually fine results from it. Being easy to handle, easy to decorate, easy to put on and a good material in every way, it offers the builder an unusual opportunity in specifying Utility Wall Board for many places in his work.

UTILITY WALL BOARDED.

The Heppes Manufacturing Company, 4502 Fillmore street, Chicago, are the originators and manufacturers of Utility Wall Board. They offer to send samples and literature on request.

REFRACTORY CONCRETE.

Mr. E. R. Stowell, Portland, Ind., is the patentee and owner of United States Patent No. 819467—"Refractory Concrete," a composition of Portland Cement and Carborundum. Mr. Stowell states that he will make contracts with reliable contractors and cement workers on very liberal annual rentals for using this process. This does not mean that Mr. Stowell will sell the material itself, which can be had in any quantity from 100 pounds to carload lots from Niagara Falls or from the many company branch stores located in different parts of the United States.

Pavements, floors, stair treads, or any surface that is finished with Mr. Stowell's Cement-carborundum finish will never wear out, it is claimed, and the material will become so hard that it will grind steel or glass. At the same time, it will have a fine, live, sparkling surface and will be anti-slipping and dustless.

In addition to "Refractory Concrete" being invaluable for use in pavements, floors, etc., the composition will make an absolutely fireproof concrete. The patentee claims that a concrete can be made with it, which can be heated to white heat repeatedly and it will not disintegrate. Besides, it will not expand or contract in heating or cooling. Neither can this wonderful material be affected by oils or acids. Mr. Stowell states that his cement-carborundum material can satisfactorily take the place of fire clay products and terra-cotta for many uses and that the cost is much less.

As a proof of what cement-carborundum is already doing, attention is called to the runways in the Hudson Terminal Buildings, to the floors in the Hudson Tunnel Cars and in 325 of the Interborough Subway Cars, New York, all being finished with cement-carborundum finish. There are also a number of important buildings in the East having floors, stair-treads, walks and vault lights finished with the same material.

With such evidences to see, it would seem that Mr. Stowell's proposition was worth investigating. It is these new materials that offer the architect, contractor and cement workers opportunities of increasing their business and at the same time making more money.

ROOFING OF QUALITY.

A unique folder in the form of a house with the invitation printed on the roof to "have one on the house" has been circulated by the H. W. Johns-Manville Company, 100 William street, New York. The invitation, while a well known phrase to the convivial, refers in this connection to the company's J-M Regal roofing, which can be depended upon to protect the building from the severest attacks of rain, snow, sun, etc. The wool felt used in J-M Regal roofing is made to exactly suit the very dense saturation it must receive. It is long-fibred, pliable and strong. This felt is thoroughly coated on both sides with specially prepared genuine Trinidad Lake asphalt. It does not melt, dry out, harden, rot, crack or crumble with time. It remains pliable and retains its water and fire-resisting properties indefinitely in any climate. Every roll of J-M Regal roofing is absolutely warranted against leaks due to defective roofing material. And the warranty is signed by a $3,000,000 company which has been making roofing for more than half a century.

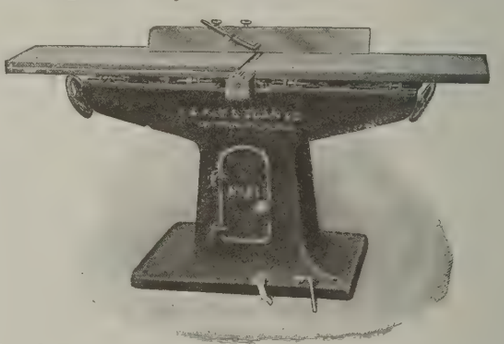
A roof of J-M Regal roofing is to your building what time tested armor plate is to a battleship.

A NEW HAND BOOK ON CONCRETE.

A new hand book on concrete brick and block making is just coming from the press. This book is a regular standard text book on concrete and is right up to the minute with information on the following subjects and many others:

The field for concrete.
Various building systems.
How to proportion them.
How to cure it.
Plant arrangement.
How to estimate.
Comparative tests.
Table of compression working values.
Ways of making product.
Selecting materials.
Forming the product.
Steam curing.
A waterproof building system fully illustrated.
Weights of materials.
Hints on selling.
Profits in concrete.

It has cost a lot of money and time to gather this valuable information, but this book is being mailed absolutely free to all who ask for it, as it is designed to assist those now in the concrete business and those who contemplate it in putting their concrete plants on the best possible basis.



This book is being mailed free by the Queen City Brick Machine Company, 381 Bank Bldg., Traverse City, Mich. These people are the manufacturers of the well known line of Helm presses for making Dry Wall blocks and pressed cement brick. The Dry Wall block system saves the cost of furring and lathing for the builder and the blocks meet with a ready sale wherever introduced. Full information pertaining to this improved line of machines for hand and power operation will also be mailed free to anyone interested.

A POPULAR TOOL.

The great popularity of Fay & Egan Company's No. 61 hand planer and jointer is evinced by the fact of its general introduction into the best woodworking shops in the land.

This machine is said to be remarkably simple. The accuracy, precision and superiority of work performed, together with the immense saving effected over hand labor, has made it a universal favorite among carpenters, contractors and retail lumbermen.

The manufacturers designed this machine for general jointing and rabbeting, planing straight or out of wind, cornering, chamfering, making glue joints, and a great variety of similar work.

J. A. Fay & Egan Company's No. 61 Hand Planer and Jointer.

In its construction the manufacturers have given special attention to the frame, casting it sufficiently heavy, making it perfectly free from vibration.

Tables are planed perfectly true, and are each vertically and horizontally adjustable, independent of each other. They are mounted on inclines tongued into each other. Each incline has an independent micrometer adjustment for perfectly aligning the tables. They can be instantly drawn away from cutter head on each side to facilitate the setting and sharpening knives and for swinging large cutters.

Cylinder is of forged steel, four sided and slotted, running in reservoir self-oiling bearings. The manufacturers furnish their safety cylindrical cutter head with this machine when ordered.

Fence bevels to 45 degrees and is equipped with spring post for holding down material while passing over head.

For further information regarding this machine you are invited by the manufacturers to write for large illustrated circular. The proper address of the manufacturers is 327-347 West Front street, Cincinnati, Ohio.

Amatite ROOFING

Buy It—and You'll Never Need Roof Paint

When a man is under the necessity of using a lot of roofing, he is pretty sure to study the subject with great care. That is why Amatite is so often used on the big ready roofing contracts. A man who has only a few hundred feet of roof will often be careless in his choice of roofing, but when it comes to thousands of square feet (as above), Amatite is sure to be used.

The following is a typical instance:

Waterbury, Conn.,
Nov. 19th, 1909.

Barrett Manufacturing Company:

DEAR SIRS:—We wish to inform you that the "Amatite" Roofing which we have used on our office, storehouse, lumber shed and barn has given most satisfactory service. The area that these roofs cover is about 15,000 square feet. The roofing is unusually attractive in appearance, and in our judgment is the most durable and satisfactory made. The fact that it requires no painting appeals to us very strongly, and this feature makes it by far the cheapest ready roofing on the market.

Yours truly,
CITY LUMBER & COAL COMPANY.
[Signed] F. B. Boardman, Treasurer.

The economy of Amatite is not only in its durability and its price (lower than any other mineral surfaced ready roofing on the market), but also in the fact that *it requires no painting.*

You may be sure it would cost something to paint their big roofs if they used a roofing that needed painting. All that is saved with Amatite.

A sample of Amatite and further information will be sent you for inspection, free, if you will send name to the nearest Barrett office at once.

SEE THAT

Compo-Board

IS IN YOUR SPECIFICATIONS

It is the most satisfactory wall lining yet devised. It will last longer than lath and plaster.

Compo-Board is easily and cheaply put on, and the walls will look well as long as the building lasts. They will never be disfigured with ugly cracks or blemishes from moisture accumulating on the walls. Will not crumble, crack or fall off. Cannot be marred by jamming furniture into them. ¶ Compo-Board makes dry, warm, moisture-proof, fire-resisting walls, ceilings and partitions. The rooms will be free from draughts, warm in winter and cool in summer. ¶ Not only is Compo-Board a superior wall lining, but it has many uses around the house, in offices and factories. ¶ It is made of thoroughly seasoned, kiln dried strips of lumber well glued together. They are covered with a thick coat of cement on either side and an outside covering of thick paper.

You can buy it in strips four feet wide and one to 18 feet long, any length you want in even feet. **Send for BOOKLET and SAMPLE.**

It explains the many uses and advantages of Compo-Board and you can get an idea of what it is from the sample.

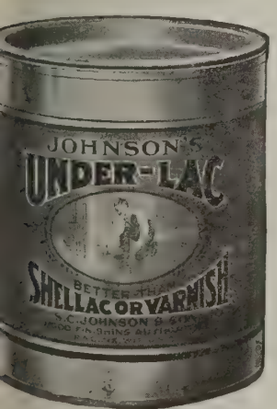
Will You Answer This Advertisement

And get these samples Delivered Free?

RIGHT by actual test we want you to know all about Johnson's Wood Dye and Under-Lac. A single trial will prove their superior merits. We will gladly bear the expense of sending samples that you may be familiar with the quality of our goods. There's a great difference between

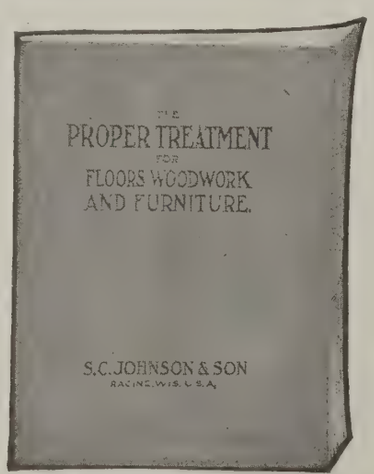
Johnson's Wood Dye

and a mere stain. It is a real deep-seated dye that penetrates the wood, giving a rich, permanent color that will not raise the grain in the slightest. Johnson's Wood Dye is made in fourteen standard shades as follows:



No. 126—Light Oak
No. 123—Dark Oak
No. 125—Mission Oak
No. 140—Manila Oak
No. 110—Bog Oak
No. 128—Light Mahogany
No. 129—Dark Mahogany
No. 130—Weathered Oak
No. 131—Brown Weathered Oak
No. 132—Green Weathered Oak
No. 121—Moss Green
No. 122—Forest Green
No. 171—Flemish Oak
No. 178—Brown Flemish Oak

Half Gallons—$1.50 Each.



Johnson's Under-Lac

is a spirit varnish which will not chip, mar or scratch. It is better than shellac or varnish, as it can be easily applied and does not raise the grain, nor is it thick and sticky like varnish—dries in half an hour. Gallons $2.50. In answering use attached coupon for samples of Johnson's Under-Lac and Dyes. State carefully the number of shades wanted. With samples we will also send a copy of our booklet, "The Proper Treatment for Floors, Woodwork and Furniture" showing all shades of dye.

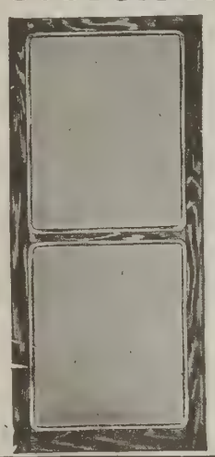
PRACTICAL STEEL CONSTRUCTION

BY FRED T. HODGSON, F. R. I. C. A.

12-mo, cloth, 120 pages, fully illustrated. Price $1.00



A COMPLETE guide for the architect and erecting engineer in the design and construction of steel superstructures, in which the elements of strength depend upon the framework of steel. Specifications are given concerning what shall constitute the "Dead Load" and also the "Live Load" per square foot, for each of the following types of buildings, viz: city dwellings, country dwellings, theatres, churches, school rooms office buildings, assembly halls, ball rooms, drill halls, factories for light or heavy work, warehouses, etc. The weight per cubic foot of various kinds of materials is given. Foundations of all kinds are thoroughly treated upon in every detail. This includes pile foundations, also steel beam grillage, all being clearly illustrated by line drawings. Cantilever foundations are also described and illustrated, and formulæ given for the calculations to be employed in determining the reactions, and the bending moment on cantilever girders. Formulæ are also presented for determining the properties of usual rolled steel sections. These formulæ are simple and practical, while at the same time they thorougly cover the subjects, being clearly illustrated by accurate dimension drawings. Careful instructions are given regarding the selection of steel column sections, outline sketches being given of the various shapes. The Gordon or "straight line" formulæ for figuring the strength of columns, are given in detail, also data for calculating stresses. Specifications are given concerning the proper sizes of rivets to be employed on all parts of the structure. All the various styles of bracing are described and illustrated, and rules given for calculations. Girders and their classification, dimensions, etc., form the subject matter for discussion in one section of the book, numerous formulæ and rules for calculating strength, etc., being given, the whole being explained and made plain by means of dimension drawings.

The construction of roofs and trusses is also ably discussed, a large space being given to the subject of rivets and riveting.

The bending moment and bending stresses are two subjects which are thoroughly handled, and discussed at length, and in such a manner as to make the meaning plain and easily understood. The book is also well indexed.

This book sent postpaid on receipt of price. Address **Hodgson Book Co.** 358 DEARBORN STREET CHICAGO, ILL.

TWO PRACTICAL BOOKS

PRACTICAL BRICKLAYING—SELF-TAUGHT. BY Fred T. Hodgson, F. A. I. C. 277 Pages, 300 Illustrations, 12 mo, Cloth Binding. Price.....$1.00

Bricklaying is becoming quite an art, and the "bricklayer" is becoming of as much importance today as he was in the 16th and 17th centuries. It is absolutely necessary now-a-days that, in order to take his proper place among the arts and crafts, he become familiar with all the minutiae of the trades. As much art can be displayed in brickwork as in any other of the trades, and it is up to the working bricklayer to get all the knowledge possible regarding his calling, so as to enable him to execute any kind of work relating to his trade. This book is designed to help him out in this matter, and discusses the various kinds of bond, ornamental brickwork, damp courses, quality of brickwork, forming of pilasters, quoins, skew arches, splay work, brick joints, chimneys, fireplaces, flues, brick-pavings, and many other classes of brickwork. The work contains 300 fine illustrations.

PRACTICAL STONEMASONRY—SELF TAUGHT. By Fred T. Hodgson, F. A. I. C. 300 Pages, 500 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This book deals with stone cutting and mason's work, methods of building walls in rustic rubble, ashler square, uncoursed, random coursed, irregular corners, snecked and square rubble polygonal ragwork, and other styles of masonry and stone cutting are explained and illustrated. Finished stones, such as window sills, window heads, coping, arch stones, key stones, and similar dressings are described and illustrated. Stone arches and joints are described and illustrated, with ample instructions for working them.

The book contains hundreds of illustrations and diagrams, and is a complete cyclopedia of practical instructions in masonry and must prove of inestimable value to the operative mason.

FOR **SIDING** AS WELL AS **ROOFING**

CORTRIGHT

SELLING TALK No. 9

DID YOU EVER KNOW THIS?

That Cortright Metal Shingles are just as desirable and successful for siding as for roofing?

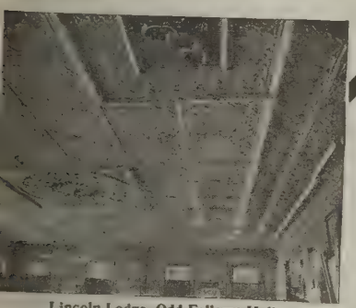
This has been conclusively proven by their many years of service for this purpose.

They're laid in the same manner as when laid on the roof and we supply a corner finish for use at the corners of the building, similar to the hip-covering we supply for the roof.

All the same advantages which apply to Cortrights on the roof apply when used as siding, prominent among them being their protection from fire and their permanence.

And what could be more ornamental than the Cortright design?

The above picture is of our Metal Slate, but always remember that we also supply three other styles.



Get the actual photographs of buildings roofed with Cortrights—see how they look in practical use.

These are in our two free illustrated books and all you need do is to send us your name, when we'll forward them by return mail.

This is one of a series of Selling Talks published to help you make more profit through Cortright Metal Shingles.

Next month's talk will explain how an absolutely tight roof is guaranteed with Cortright Metal Shingles.

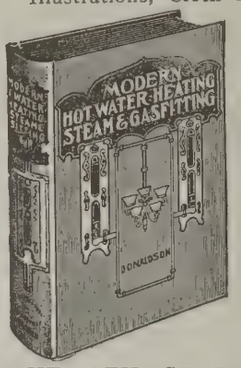
USEFUL BOOKS FOR CONTRACTORS

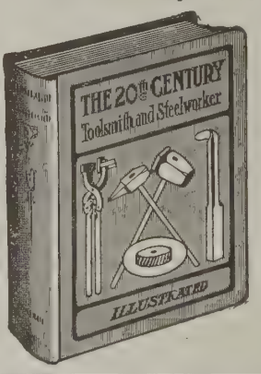
PRACTICAL UP-TO-DATE PLUMBING. By George B. Clow. 310 Pages, Over 250 Illustrations, Large 12mo, Cloth. Price.....$1.50



A practical, up-to-date work on Sanitary Plumbing, comprising useful information on the wiping and soldering of lead pipe joints and the installation of hot and cold water and drainage systems into modern residences. Including the gravity tank supply and cylinder and tank system of water heating and the pressure cylinder system of water heating. Connections for bath tub. Connections for water closet. Connections for laundry tubs. Connections for wash-bowl or lavatory. A modern bath room. Bath tubs. Lavatories. Closets. Urinals. Laundry tubs. Shower bath. Toilet room in office buildings. Sinks. Faucets. Bibb-cocks. Soil-pipe fittings. Drainage fittings. Plumber's tool kit, etc., etc. The composition and properties of solder and how to make it, are carefully treated and a chapter is devoted to useful information. There are given a large number of valuable tables giving the pressure at different elevations, capacity of pipes, etc. The work also contains over fifty carefully prepared drawings, giving complete piping connections for home, tenement and office buildings.

MODERN ESTIMATOR AND CONTRACTOR'S GUIDE. FOR PRICING ALL BUILDERS' WORK—WITH MANY TABLES, RULES AND USEFUL MEMORANDA. By Fred T. Hodgson, F. A. I. C. 318 Pages, 100 Illustrations, 12mo, Cloth. Price.....$1.50

One of the most desirable books for the general builder to have, is a good and reliable work on estimating; and we are certain the book we are now offering, if the large number of favorable testimonials and press notices we have received is any indication, is one of the best, and most reliable books on the subject that has ever been published on this continent—or any other for that matter. We have no hesitation whatever in recommending this book to our patrons who want a good work on estimating. The work gives a lengthy and clear explanation of the several methods employed in estimating, among which may be mentioned, "Estimating by comparison," "Estimating by the cubic foot," "Estimating by quantities," "Estimating in detail," and several other systems.



HOT WATER HEATING, STEAM AND GAS FITTING. By Wm. Donaldson. Large 12mo, 250 Pages, Over 100 Illustrations, Cloth Binding. Price.....$1.50

A modern treatise on Hot Water, Steam and furnace Heating and Steam and Gas Fitting, which is intended for the use and information of the owners of buildings and the mechanics who install the heating plants in them. It gives full and concise information with regard to steam boilers and water heaters and furnaces, pipe systems for steam and hot water-plants, radiation, radiator valves and connections, systems of radiation, heating surfaces, pipe and pipe fittings, damper regulators, fitters' tools, heating surface of pipes, installing a heating plant and specifications. Plans and elevations of steam and hot water heating plants are shown and all other subjects in the book are fully illustrated.

The closing chapter, devoted to useful kinks, contains information on a variety of subjects which will be found of interest and value to the workman, as will also the many useful tables given at the end of the volume.

THE 20TH CENTURY TOOLSMITH AND STEEL-WORKER. By H. Holford. 240 Pages, 120 Illustrations, 12mo, Cloth Binding. Price.....$1.50

This book is written in the interests of all mechanics connected with the working and manufacture of steel into tools, and gives all the secrets and obstacles to be overcome towards making steelwork or toolmaking a success. It will be invaluable to the young mechanic and place him years in advance of his fellow workman, by the reading and a little reflection of its contents.

It is not comprised of quack theories or foolish ideas, and is not written by a college student, who knows nothing except what he has been told or gathered up from papers and periodicals. But is written by a thorough expert mechanic who has spent the best part of his life over the anvil with the hammer and tongs.

Knowledge Will Put YOU in the Spot Light

The fellow that does only what he has to, and spends his spare time in theaters and pool rooms or on the street corner—that fellow need not expect to go very high.

How did your superintendent, or general manager, or foreman, or department chief land the position he holds? By showing knowledge of his work; by proving that he has ability; by getting ready when he was in the same job you now hold.

How can you get into the spot light? How can you mount over the crowd and attract the attention of the "big man"?

By your own efforts properly directed. By being willing to devote to study a part of your spare time. By giving the International Correspondence Schools a chance to direct your efforts and lead you to the front.

Your spare time, if you would but realize it, could be made more profitable than the time sold to your employer.

Mark and mail the coupon to find out all about the I. C. S. plan to put you into the spot light. Doing so will cost you nothing, and will bring to you a full explanation of just what kind of Course you will get, what you will learn, and what has been done by other students of the same Course.

Three hundred I. C. S. students a month write to tell of progress.

Don't wait.

Mail the coupon NOW!

Dustman's Book of Plans and Building Construction

By U. M. DUSTMAN
(Licensed Architect)

Press Reviews

The most pretentious book of plans and building construction that has ever come to our attention.—*The St. Louis Lumberman.* The suggestions offered in description and text are of a practical nature.—*The Cement Era.* The information given in this book cannot be found in any other works.—*The Lumber World.* It is more complete and up-to-date than any other book along the same line.—*The American Lumberman.* The author does not make a mistake so common in works of this character.—*Mississippi Valley Lumberman.* The book is all that is claimed for it and more, too.—*Builder and Contractor.* The book appeals strongly to the contractor and builder. The author is a well known practical architect of over thirty years' experience.—*Building Age.*

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying Out a Building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions for Mixing and Placing Concrete—Proportions—Sand and Gravel—Itemized Lists of Material Costs—Writing of Specifications.

250 pages, size 9x13, bound in blue cloth, white hand stamping. Price $2.00. You don't have to buy the Plans and Specifications to build from this book. Sold by booksellers and supply houses generally or sent prepaid to any address on receipt of price.

Notes on Heating and Ventilation

Price, $2.00 delivered

By *John R. Allen*, M. Am. Soc. Heating and Ventilating Eng.; Junior Professor Mechanical Engineering, University of Michigan, Ann Arbor.
Second Edition; Bound in Cloth, 6¾x4¾ in.; 200 pp.
This book is a resume of lectures delivered to classes in heating and ventilation at the University of Michigan. It is written primarily for the steamfitter and designer of heating systems It presupposes a knowledge of the construction and operation of the simpler forms of heating systems. Reduced to as brief a form as possible, so that readers can readily find notes or data desired.
Contents—Theory of heat and measurement of temperature. Heat losses from buildings; rules for determining heat losses in different constructions. Different forms of heating systems; their advantages, disadvantages and relative economy. The design of a direct steam heating system. The design of an indirect heating system. Steam boilers and steam piping. Carrying pipes underground, etc.
Hodgson Book Co., 358 Dearborn St., Chicago, Ill.

The 20th Century Bricklayers and Mason's Assistant

By FRED T. HODGSON

This work is in two parts combined in one volume, the first part being devoted altogether to brick work of all kinds; and this includes an explanation of the various terms employed in the trade with illustrations and definitions showing what the terms really mean.

There is a chapter on Foundations which goes into the matter at great length, and is fully illustrated and explained, and which shows how to lay out and prepare any kind or shape of foundation.

Damp courses are dealt with in a separate chapter in which the various methods of constructing damp courses are fully illustrated, described and explained are shown. Various methods of forming brick pilasters, columns, quoins and pands are explained, illustrated and described. Joints in brick work are illustrated, described and explained in a separate chapter in which the kinds of mortar to employ for various works are defined. Chimney breasts, flues, stacks, fire-places and chimneys of all kinds are described and illustrated.

Brick bonding for all sorts of work is shown and illustrated by a large number of diagrams and the manner of bonding is fully explained. Brick arches of every kind, gauged and ungauged, are explained at length, and a large number of illustrations are shown, giving methods of describing the arches and obtaining the joints for same. Bay and oriel windows are discussed and the methods of working them are shown and described both by text and diagrams. Methods of measuring brickwork, pointing, concrete and other matters for the estimator are fully described. The tools used by the bricklayer and his helpers are fully illustrated and described. Bricklayers' mortar and other useful memoranda close Part One of the book.

Part Two deals with the stone mason's work altogether and opens with a chapter on definitions of technical terms used in masonry. Tools and appliances are fully described and as fully illustrated, with explanations and methods of using them. The trade names of wrought stones are given with illustrations showing the work in progress and in a finished state; also methods of working them. Methods of building walls in rustic rubble, ashler square, uncovered, random coursed, irregular corners, snecked and squared rubble, picked polygonal ragwork and other styles of work are explained and illustrated. Finished stones such as window sills, window heads, copings, arch stones, key stones and other dressings are described and illustrated. Stone arches and joints are described and illustrated, with ample instructions for working them. A chapter on preparing stone steps and stairs is given, along with complete diagrams and instructions showing how the work is done. There is also a chapter explaining the method of building a circular headed window or door in a circular tower or other circular wall. A chapter on estimating stone work, with a copious specification is also included along with a short treatise on building skew arches and skew bridges, and which is illustrated with a large number of diagrams and working sketches, showing how to do the work in a proper manner. This part is illustrated with over 200 working drawings and diagrams.

The whole work contains over 450 fine illustrations and diagrams, and is complete cyclopedia of practical instructions in brick-work and masonry and must prove of inestimable value to the operative bricklayer and mason. 12 mo., cloth, price, $1.50; half leather $2.00.

Send postpaid to any address in the world upon receipt of price.
Your money cheerfully refunded if the book is not all we claim for it:

"That Coupon Gave Me MY Start"

"It's only a little while ago that I was just where you are now. My work was unpleasant; my pay was small. I had my mother to take care of, and it was tough sledding trying to make ends meet. I hadn't had much schooling. I didn't *know enough* to fill any better job than the one I had.

"One day I saw an advertisement of the American School. It told how other men got better positions and bigger salaries by taking their courses. I didn't see how a correspondence course could benefit me, but as long as it didn't *cost* anything to mark the coupon I thought it was worth investigating at least. I marked the coupon and sent it in on the next mail.

"That was two years ago last April, and now I'm drawing more every week than I used to get in a month."

If YOU want a better position, if YOU want to get into congenial work, if YOU want a salary that's worth while—

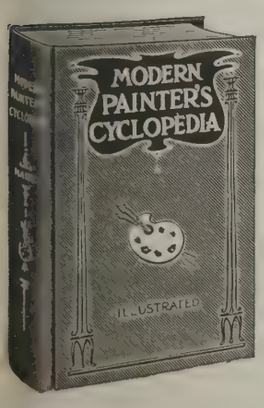
JUST FROM THE PRESS

The Practical Cabinet Maker and Furniture Designer

By FRED T. HODGSON, F. A. I. C.



Large 12 mo, Cloth Binding. Price.....$3.00

An entirely new book on cabinetmaking in all its phases and is intended to aid young workmen in making all kinds of furniture from the simplest mission to the most elaborate styles. It contains lessons of the framing and joining of woodwork, glueing and the using of glues generally, veneering, doweling, gilding and completing fine cabinet work. It describes the various woods suitable for cabinet work and the best methods of working them. Various styles of work are shown, French, German, Queen Anne, Chippendale, Shereton, Hepplewhite, Colonial, Adams, Louis XVI, Louis XVII, Louis Seize, Boule work, and other styles, thus enabling the student to recognize the style of a piece of furniture on sight.

The book is well illustrated with several hundred illustrations.

The Modern Painter's Cyclopedia

By F. Maire, Head Instructor of the Chicago School of Painting. Decorating and Paperhanging Illustrated, Cloth $1.50

It is an entirely new book on painting. It is not a revised edition of an older book of nearly the same title. It treats its subject matter in an up-to-date way, discarding the old methods where the new are better. The headings of the subject matter are the only remains of the older book.

The manner of writing up the subject matter, while it may not be new in some other publications devoted to the study of manual trades, is certainly new as applied to any heretofore published which treats upon paints and painting.

As much as possible many tedious repetitions have been saved by having arranged all details throughout the book in numbered paragraphs so that, whenever it is needed, reference is made to such or such numbered paragraphs, which give the additional information.

At the end of every subject-head will be found "Questions," each of which are numbered and which appertain to a similarly numbered paragraph of text, where the answer to the question asked will be found. It is hoped this will be of great help to apprentices or students who are endeavoring to obtain a better understanding of the painting trade, as it will enable them to search out the answers, and better still, to review what they have just read and to give the answers from memory, as it will help to fix the information gained more permanently.

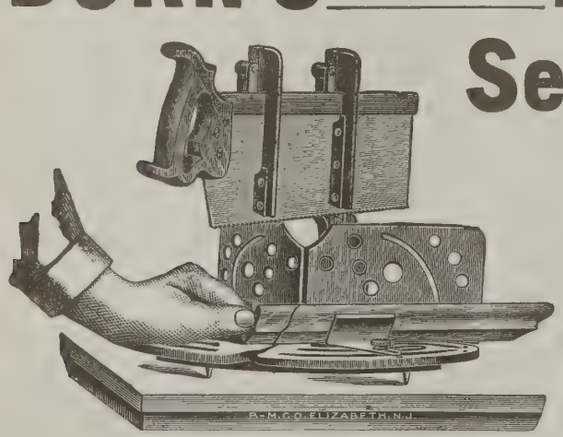
Extension Bit Holder, No. 5



It has been found very difficult to make a strong and adequate bit extension of a dimension so contracted as to follow a ⅝ inch bit into a hole, without either breaking the chuck through its weakness, or losing the bit in the hole being bored. As these extensions are used largely for boring between partitions, such results may be rather disastrous through the loss of the bit in the partition, or marring the grace of the structure into which the hole is bored. The chuck to No. 5 is a little less than ⅝ inch in diameter, so will follow a bit of that size. The four jaws are made in one piece from steel, and are exceedingly strong and so constructed that the square corners of the bit shank will go between them, holding them very rigidly. This extension is durable and capable of performing all that can reasonably be expected of it. The tool is most useful to electricians and plumbers.

Price, in lengths of 12, 15, 18 and 21 inches, each $1.50

THIS IS OUR GREYHOUND SAW. "THE PUREST OF QUALITY."

IN INTRODUCING our "GREYHOUND" brand of Saws to the Craft, we have departed from our usual custom in naming instead of numbering the saw. This saw will be known as our "GREYHOUND" and will be the only Bishop brand of saw known by name. We have had a chemist experimenting for years to originate a purity of steel with a fine grain and tough body that would stand up under such a fearless warranty as we place on our "GREYHOUND" brand of saws. We now have it. We know its worth as well as its value. As workers of steel we understand it. We had to name it and we have christened it BISHOP'S REFINED "GREYHOUND" STEEL, associating our trade mark with its name. We have in this "GREYHOUD" Saw blade a purity of steel that is tough, tempers accurately and evenly—together with the special way it is made—enables us to guarantee that this "GREYHOUND" brand of Saws will cut faster and run easier in all kinds of wood, hold its sharpness and set longer than other makes of good Saws in the world. **We Refund the Money** if 30 days trial does not prove our guarantee. Our pride is quality with an honest opportunity for the purchaser to judge. Each saw is tagged with our warranty on it. No expense has been spared to make this Saw the most perfect in the world. We invite correspondence with anyone who has our "GREYHOUND" brand of Saws in use. Made in both straight and skew back, also narrow patterns. If narrow style is wanted, specify it.

Inches,	18	20	22	24	26	28	30
Each,	$2 35	2 50	2 65	2 80	3 00	3 30	3 65

Net. Packed one in a box.

In workmanship this Saw possesses all the skilled mechanical features known to the art of saw making. The hang of the blade has been carefully studied and adjusted, to suit the fancy of the most critical. **Send for Circulars.**

U. S. Standard Cement Mixers and Block Machines

ARE THE STRONGEST, LONGEST AND EASIEST WORKERS ON THE JOB

U. S. Standard Junior Block Machine.

OUR **U.S. Standard** Junior and Senior Block Machines are both built upon the same basic principles, the former building a 16″, the latter a 24″ long block and all fractional lengths thereof. Both of these machines build hollow blocks 6″, 8″, 10″ and 12″ thick and veneer blocks 3″, 4″, 5″ and 6″ thick. The equipment also provides plates for circular blocks, angle blocks of any desired angles, porch pier blocks, chimney blocks, etc. These machines are capable of producing a greater variety of styles and sizes of blocks without additional investment than any other machine made, and for simplicity, speed, completeness, strength and beauty of blocks cannot be equalled.

THE **U. S. Standard** are continuous mixers. The measuring and proportioning of the cement, sand, gravel or crushed stone is done automatically. With the **U. S. Standard** measuring is positive, and does not vary with coarse or fine, wet or dry ingredients.

SPECIAL FEATURES—Accuracy in measuring, correctness in proportioning and thoroughness in mixing the ingredients. All these operations are automatic and absolutely reliable. Detailed information will be furnished upon application for our Catalog No. B.

Senior No. A

THE ASHLAND STEEL RANGE & MFG. CO. ASHLAND, OHIO

Try Them

And Then Buy Them

That's a safe way to buy. And, you know it is one meritorious article that can be sold this way.

The molds which make this pier and chimney will make a variety of other things.

It's elasticity of these molds which makes them valuable.

Our catalogue illustrates the molds.

MOLDS
to make this chimney and pier
$19.00

SEND FOR A CATALOGUE

You'll see how one mold will make different sized blocks from two to twenty-four inches—how another set of molds makes twenty-one different sizes. Do not overlook this, send today.

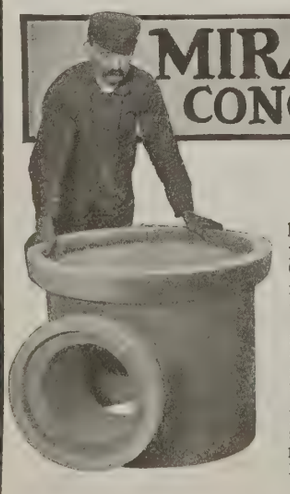
CEMENT IS CHEAP—BIG PROFITS

making concrete products and building sidewalks Get a mixer. Get started. Prospects brighter than ever; things are going to boom in the cement industry. Get free Catalog "N."

CEMENT MACHINERY CO.,
JACKSON, MICHIGAN.



HOW ARE YOU?

Are you making any money in your Concrete business, or do you have trouble from want of information on best methods? If you need any advice on any Concrete job, write me, tell me what you are up against, as I have been working in concrete since 1873 and should know something about the business by this time, and most likely can help you. If I cannot, I will tell you so. My charges for water-proofing formula are $2.00, or for other information, unless for large work that requires more attention. Reasonable charges for large operations. Special information on constructing dams, water works wells, method of sinking large wells and foundations in soft earth or water, Iron reinforced Concrete construction, Terazzo floors and engineering difficulties, working concrete in freezing weather, under cut work, elastic moulds for making statuary, making moulds for garden vases and getting up the patterns.

I conduct a correspondence course in Concrete by mail for a limited number of pupils for $20.00, which includes my water-proofing formulas, coloring and compound for making blocks harder after made. Get your information from one who has done the actual WORK. You will save the price of a course on your first job. Address

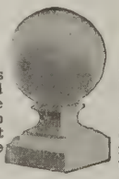
G. O. SANDERS, CONCRETE ENGINEER AND CONTRACTOR
89 Gainsboro Street, BOSTON, MASS.

MIRACLE CONCRETE

MIRACLE MOLDS

have revolutionized pipe making. Cement pipe can be made for one-third the cost of clay.

24″ concrete pipe costs 35c per foot to make.



24″ clay pipe sells for $1.25 per foot.

An outfit for making 24″ cement pipe costs $50.00, other sizes in proportion.

Every size profitable.

ORNAMENTAL CONCRETE

Molds for Lawn Vases porch columns and balusters—also fence decorations, make up a part of the equipment of every concrete worker.

$1.50 is the cost of a concrete Lawn Vase that sells for $10.00, easily meeting the competition of iron vases of $20.00 and $25.00.

Special ornamental mold circular enclosed in every catalog.

MIRACLE BLOCK

Its distinctive feature is the two overlapping rows of air spaces, which make it the only one piece frost and moisture proof block on the market.

Handsome residences and garages, substantial factories, barns, stores, and public buildings erected with it. Block Machine is automatic, rapid and adjustable.

Exclusive protection given with each machine.

Big 128 page illustrated catalog free to those interested in the cement business.

DIAMOND FACE

REFRACTORY AND ACID-PROOF

CONCRETE

(Portland Cement-Carborundum)

Stowell Process U. S. Patent No. 819,467

PAVEMENTS, floors, stair treads or any surface finished with the cement-carborundum composition will never wear out.

It will become so hard it will grind steel or glass.

It will have a fine, live, sparkling surface.

It will be anti-slip and absolutely dustless.

The cost from 4c to 6c the square foot for the ½" finish, depending on location and local conditions.

ALSO this composition will make an absolutely fireproof concrete—a concrete that can be heated to a white heat repeatedly and will not disintegrate; a concrete that will not expand or contract heating or cooling, and one that is not affected by oil or acids; a concrete that can take the place of fireclay products and terra cotta for many purposes and will cost less.

License for the above process granted to reliable cement workers and contractors only. License is let on a very liberal annual rental basis.

For particulars and terms, state territory in which you operate, and address

E. R. STOWELL, Portland, Ind.

Got Any Bars to Bend?

Then you want an "ACME" —of— course

Use it once and you'll never look at any other

Patented

Clamp bears on bar 7 inches. Can't slip. Cast steel base. Nothing to wear.

WITH OUR "ACME" BAR-BENDER

ONE MAN can bend 1¼ in. bar cold. Cannot slip. Not a loose part on it. Most powerful, simplest and all-around valuable bender on the market.

WHAT ARE YOUR BEAD NEEDS?

Our "C. B. S." MAHONING Bead is the best and cheapest bead made for erecting on wood. No clips required. Perfect reinforcement for plaster angles. Clips furnished where required for brick or tile work.

We also carry a full stock of black and galvanized tie wire and lathing staples for wood and brick.

HOW ABOUT METAL LATH?

or REINFORCING STEEL? We sell the best only.

Can't you make use of our expert ENGINEERING STAFF? Others do. We furnish absolutely reliable engineering counsel—make plans, give details, guarantee accuracy, and help you in many valuable ways. NO CHARGE to our customers. Better look this up.

No Idle Days for You this Winter if You Put in

Ideal Concrete Machinery

ABOVE is the Ideal Block Machine, equipped with the new patented Scraper and Finisher attachment—the latest improvement in Ideal Concrete Machinery. This single attachment increases the output of the block machine *10%*—just one more point of the twentieth century superiority in Ideal equipment.

Mr. Carpenter or Builder: you can reap a golden harvest through the winter days, when outside work is impossible.

You can keep yourself and men *busy all winter long.*

You can produce concrete blocks that are fireproof, waterproof, wearproof, cheaper for building than lumber or brick, easy to lay, beautiful and artistic in design—blocks that sell with a big profit for you.

You can pull in the "fat" contracts and build up a business which is opening up bigger and better every year.

"GAGE"

The Self-Setting Plane

Think of the time saved by a plane that sets itself—and sets exact instantly. We give tangible reasons why the GAGE is the most economical plane for all-around work; here they are: The GAGE is the ONLY plane which sets itself, which has an adjustable iron throat extending through the stock. Which works equally well on all classes of work and wood. We give thirty days' trial on purpose to prove how good it is.

A Wonderful New Ellipsograph and Divider

—called the KELLEY

Draftsmen, Pattern-makers, Mechanics, etc., can now obtain an instrument which will draw an ellipse of any given major or minor axis, just as readily as an ordinary compass will draw a circle. For carpenters, builders and contractors its use is a necessity for saving time and doing perfect work.

Illustration shows the machine and a few of the curves obtainable with the KELLEY Ellipsograph. It is the acme of simplicity in operation and is absolutely reliable in results. It can be adjusted for any ellipse or curve in a few seconds and is readily understood by anyone.

Price Complete $3.00

We positively guarantee satisfaction. Send $3.00 for this unique instrument and we will send one by return and pay charges. It will pay for itself in a saving of time, labor and worry.

We Want Every Ambitious Carpenter and Builder

To Examine This Great Work—Free!

Ten Big Complete Volumes

4,670 Pages, 3,000 Illustrations, Plates, Etc.

This great cyclopedia is a complete review of architecture, carpentry and building. No work so practical, so complete, so reliable, has ever before been placed on the market. Every problem likely to confront you in your daily work is solved, and the solution placed before you in such a clear manner that you cannot fail to understand and profit by it.

If you have a building contract in hand, you need this great

Cyclopedia of Architecture, Carpentry and Building

at your elbow to show you the most economical and practical method of handling the job and the proper way to estimate the amount of material required, with the least possible waste.

For the practical carpenter and student, its value as a Home Study Instructor cannot be estimated.

Just examine the "Partial List of Contents" below and you will at once realize how broad is the field covered by this work—how thoroughly it covers every branch of the building trades.

The books are illustrated with hundreds of full-page plates; plans for homes and buildings; views of jobs completed and in the course of construction. Securely bound in half red morocco leather; titles stamped in 23-carat gold. **Read our free examinatisn offer.**

Sent Free for Examination

To prove our absolute confidence in the superiority of this work over all others, we make this liberal offer: Upon receipt of the coupon below we will place the entire cyclopedia of ten volumes in your home or office—you keep the books five days—examine them thoroughly, critically—subject every formula and problem to a severe test. If you are satisfied, send $2.00 after examination and $2.00 every month until you have paid the special $24.00 price. The regular list price is $50.00.. As a further guarantee, we will remove the books at our expense if you are not satisfied. We pay all express charges.

PARTIAL LIST OF CONTENTS

Carpentry—Building—Estimating—Stair Building—The Steel Square—Building Superintendence—Contracts and Specifications—Building Laws—Building Material—Roof Trusses—Masonry—Reinforced Concrete—Concrete Blocks—Steel Construction—Mill Building—Fireproof Construction—Cornices—Skylights—Roofing—Hardware—Plastering—Painting—Electric Wiring and Lighting—Heating—Ventilation—Steam Fitting—Plumbing—Architectural Drawing—Freehand and Perspective Drawing—Orders of Architecture.

For a short time we will include as a monthly supplement, for one year, the **Technical World Magazine.** This is a regular $1.50 monthly, full of Twentieth Century Scientific facts, written in popular form. Also contains the latest discussions on timely topics in invention, discovery, industry, etc.

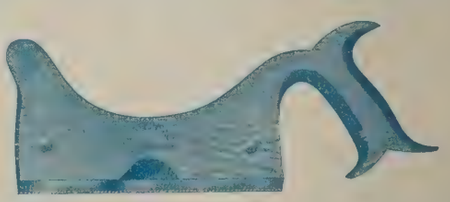
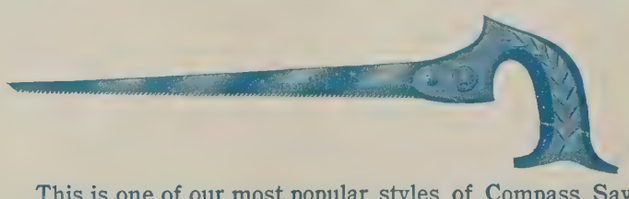
ATKINS SILVER STEEL SAWS



WE HAVE said a great deal about ATKINS SILVER STEEL HAND SAWS. We have told you how they are made and what splendid service they are giving others and what they will do for you. Now, we want to show you a few pictures taken from photographs of the Saws themselves, because we know you will be interested. We can't show you the whole line, for we make hundreds of different kinds of SILVER STEEL SAWS for all purposes.



But look at this Hand Saw. Ain't she a beauty? Is there not something distinctive and individual about it? Look at its graceful lines and the finish and the perfection hardwood handle. Does it not look like a Saw that would give results? This is our No. 53 and it comes in all sizes and points. There are a number of other patterns, styles and finishes, many of which are described in our Saw Sense Book.

Here is one of our finest Back Saws. Does it not look as though it would do the business? The blade is of SILVER STEEL and will, therefore, run a long time without filing the little fine teeth. The back is of heavy stiff steel and clamps the blade like a vise. The handle is of applewood, easy grip pattern. We make several styles of Back and Mitre Saws.

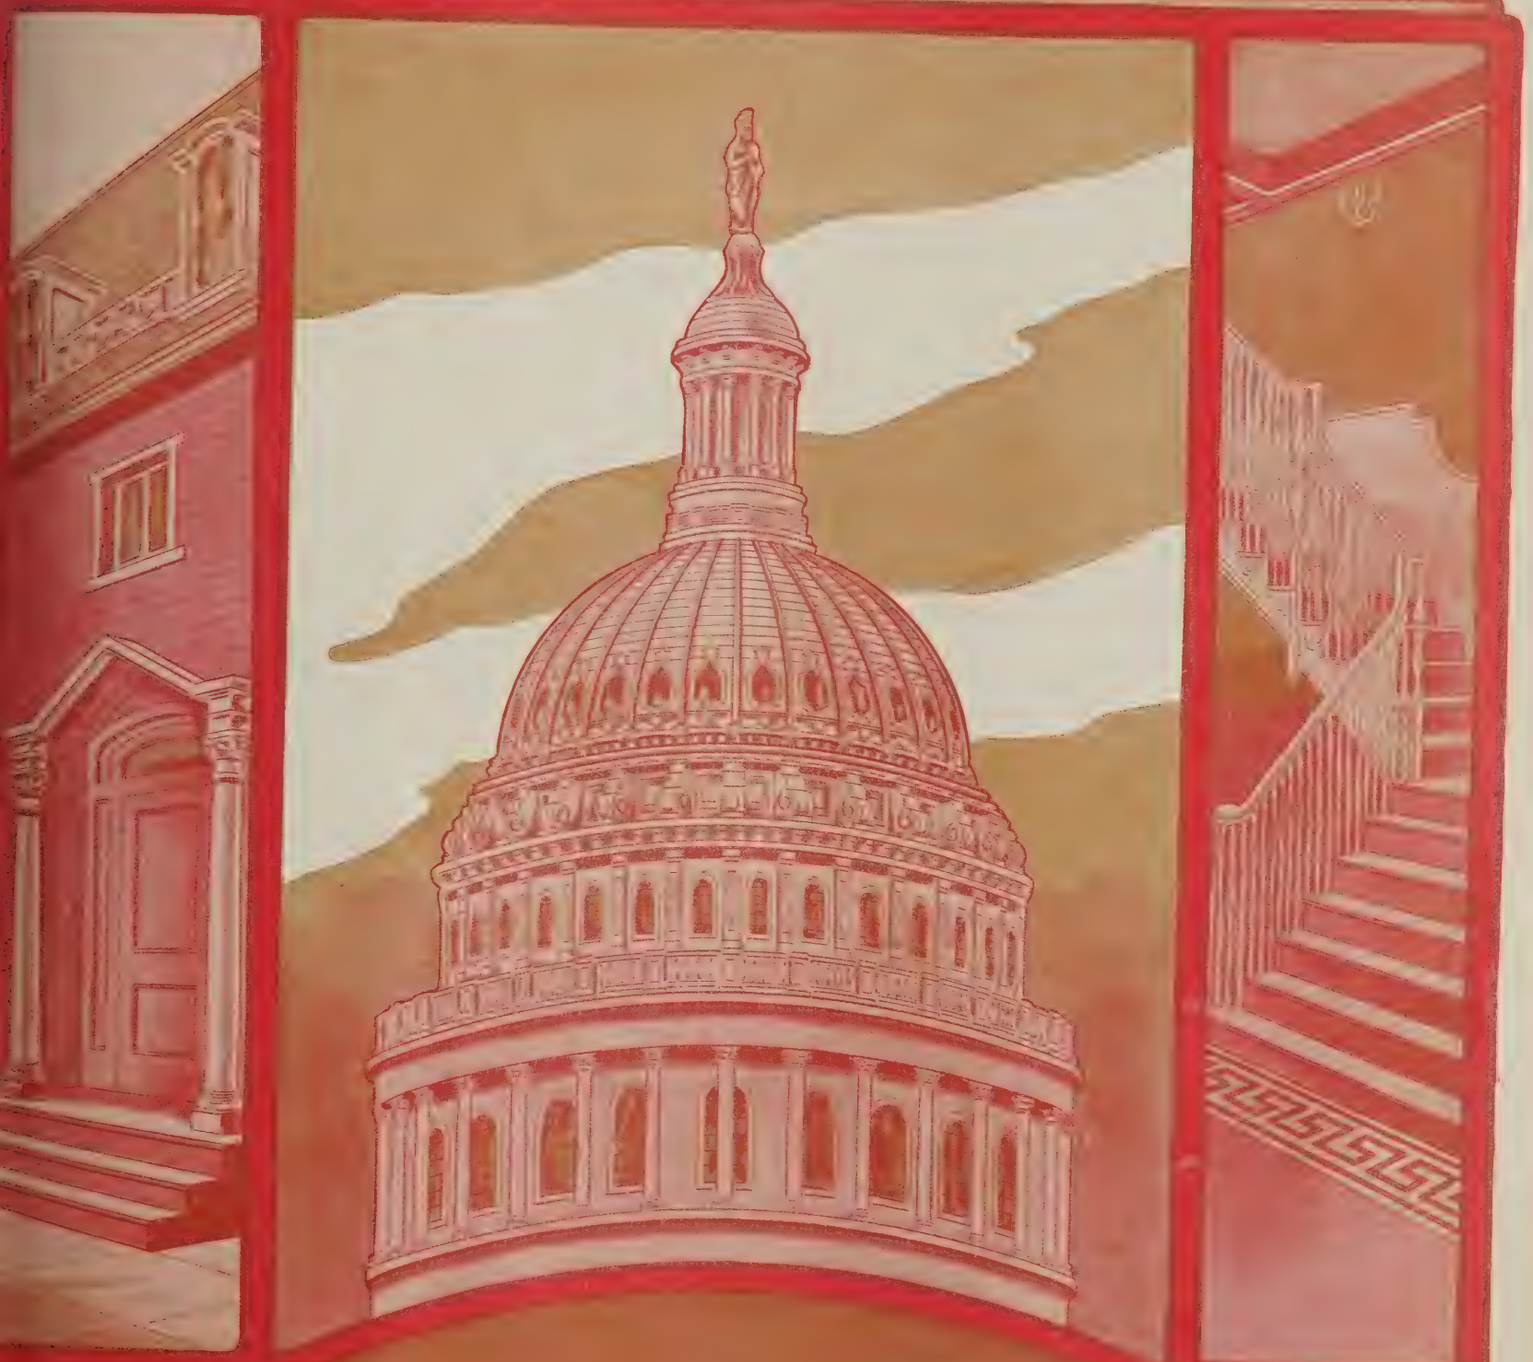
This Stairbuilders' Saw is a mighty handy tool. The blade may be regulated so as to cut any depth, assuring absolute uniformity.

This is one of our most popular styles of Compass Saw. We call it our No. 2. The blade is of SILVER STEEL and is, therefore, very hard and tough, but not brittle and it is difficult to twist these blades out of shape. The handle is of carved and polished applewood.

This is our No. 3 Nest of Saws with Nail Cutting Blade They are indispensable to every carpenter. The set consists of a Compass and Keyhole Blade, together with a hardened steel metal cutting blade, all of which attach to an adjustable handle. The next time you need a Compass or a Keyhole Saw, you had better pay a little more for the No. 3 Nest and thus secure the advantages of the Nail Cutting Blade.

Atkins Always Ahead

HOW TO BUY THEM



ATKINS SILVER STEEL SAWS are for sale by most first-class Hardware Dealers, but if your dealer does not sell them regularly, he will be glad to order for you from his wholesale house. If you have any difficulty in getting them in this way, please let us have your dealer's name and we will see that you are taken care of.

OUR FREE OFFER We are still compiling our list of carpenters and if you will send us ten cents to pay postage, we will forward with our compliments, a fine strong nail apron, together with our Saw Sense Book or Carpenters' Catalog, our monthly time book with scale of wages and some mighty interesting information in regard to High Grade Saws. Write to-day and secure this valuable package.

AUGER BIT ESSENTIALS

The Fourth Reason for the acknowledged superiority of

RUSSELL JENNINGS BITS

is the size and shape of the

SPURS AND LIPS

The spurs are not heavy enough to cause undue friction and thus make the operation of boring laborious, and yet they are not filed down to an extent that renders it impossible to re-sharpen a great many times. Compare them with the spurs of other bits.

The lips are shaped for strength, free cutting and repeated sharpening.

Our booklet tells just how to sharpen auger bits. Better have one—it's free.

RUSSELL JENNINGS MFG. CO.

CHESTER, CONN., U. S. A.

BISHOPRIC WALL BOARD AND SHEATHING

ANY WEATHER is "Good Building Weather" when you use Bishopric Wall Board as a substitute for lath and plaster. It is cheaper and better and does away with all delays in building. It is nailed to studding dry, ready for immediate application of paper, paint, burlap, or any other kind of decoration.

Bishopric Wall Board Easily Applied

This substitute for lath and plaster is made of kiln-dried, dressed lath, imbedded in hot Asphalt Mastic, surfaced with sized cardboard and cut at the factory into 4x4 ft. sheets, which are easily and quickly nailed to studding, ready for immediate application of wall paper, paint, burlap, or other decoration.

It is applied dry, is guaranteed not to swell, shrink, warp, crack, flake or blister; is clean, sanitary, and odorless; is proof against moisture, cold, heat, and vermin; saves fuel in winter and keeps out summer heat; also deadens sound.

It is suitable for dwellings, factories, new partitions in old buildings, finishing attics, porches, laundries, cellar ceilings, garages, etc.

Applied Dry Winter or Summer

Shows Construction of Bishopric Wall Board.

PRICE WALL BOARD AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6.40 per crate, or $2.50 per 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point.

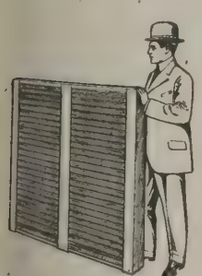
Cheaper Than Lumber. Saves 75% on Labor. Does away with Building Paper.

BISHOPRIC SHEATHING

Ideal Material for Cement Buildings or Stucco Exteriors. Proof against Dampness.

Bishopric Sheathing is made of same materials as Wall Board, but finish is not necessarily so fine, therefore costs less. It is of uniform thickness, insuring a perfectly even surface when applied.

Bishopric Sheathing is nailed to studs, with lath and asphalt side exposed. Over laths, weather boards are nailed or cement applied.



Shows construction of Bishopric Sheathing.

Arrow points to Asphalt Mastic into which laths are imbedded.

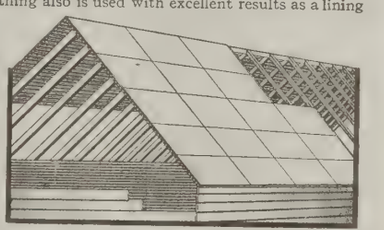
Bishopric Sheathing makes a more solid and substantial wall than lumber. There are no gaping joints; no widening cracks due to shrinkage; no knot holes.

The Asphalt Mastic in Bishopric Sheathing is a non-conductor, moisture cannot penetrate it. It is proof against vermin. The pests cannot bore through the tough, gummy Asphalt Mastic. In applying weather-boards over the laths, dead air space is left between the laths forming splendid insulation. Does away with the expense of building paper and cost of its application.

One Wagon load of Bishopric Sheathing covers an area from six to ten times as great as one load of lumber—a tremendous saving in hauling. Five thousand feet can be hauled in an ordinary wagon.

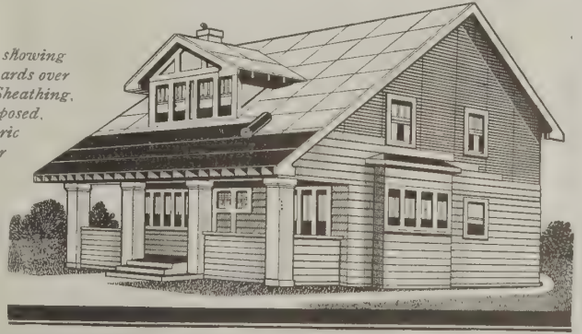
Wall Board and Sheathing are shipped in crates

The cost of applying Bishopric Sheathing is but $2.50 per 1000 feet—A SAVING OF ABOUT 75 PER CENT. Furthermore, 1,000 square feet of wood sheathing covers but 750 feet of surface, 20% less being due to tongue and groove. In Bisnopric Sheathing 1,000 square feet covers 1,000 square feet of space.



In applying ordinary lumber, heavier scaffolding, more tools and greater scaffold floor-space are required In applying Bishopric Sheathing, one man drives a few nails in each sheet; a common laborer or boy can finish the nailing.

Bishopric Sheathing insures comfort during the construction of the building. As soon as the building is closed in with Bishopric Sheathing, the men may work in comfort on the inside during bad weather, finishing the outside on suitable days. This insures continuous work, without loss of time, enabling the contractor to hold his men and complete the work in the least possible time.



Bishopric Sheathing is used with equally splendid results under flooring and as a substitute for roofing boards. Used under floors, it serves as a sound deadener and keeps out dampness; used under the shingles, it keeps out summer heat.

ITS MANY USES—Bishopric Sheathing also is used with excellent results as a lining for dairy barns, ranch houses, poultry houses, driving stables or any out-door building where protection from the elements, Summer or Winter is desired.

Bishopric Sheathing is the ideal material for cement exterior or stucco work. Cement firmly adheres to the laths and Asphalt Mastic and makes a solid, smooth exterior. For factory or residence this form of cement or stucco construction is the cheapest and best known.

Shows Bishopric Sheathing over rafters ready for Bishopric Roofing, also Weather-boards over Bishopric Sheathing.

Ideal home showing Weather-boards over Bishopric Sheathing, lath side exposed, also Bishopric Roofing over Bishopric Sheathing, (smooth side of sheathing exposed)

PRICE SHEATHING AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6, or $2.35 per square of 100 square feet, f. o. b. New Orleans, La., Cincinnati or Alma, Mich. We ship from nearest point.

Write for Descriptive Booklet and Samples of Bishopric Wall Board, Bishopric Sheathing and Bishopric Roofing—All will be sent free.

UTILITY WALL BOARD

A Fibrous Water-Proof Board Made in Convenient Widths and Lengths

To be Used Instead of Lath and Plaster in New Building or Repair Work

Make your Garage Warm by Lining with UTILITY Wall Board

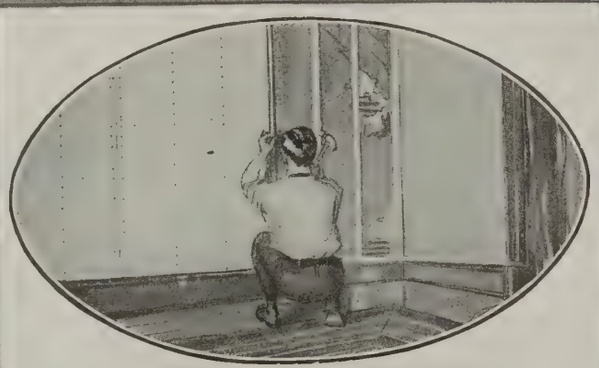
Mr. Contractor

This is your chance to make more money and finish your jobs quicker. UTILITY WALL BOARD is right in quality and price. It has come to stay and is rapidly taking the place of lath and plaster.

Every up-to-date contractor and builder should get samples of UTILITY WALL BOARD at once. There are hundreds of places it can be used with a profit to you and satisfaction to the owner.

Remember that all delays of the plasterer are a thing of the past for those who use this modern building material.

This shows how an Attic looks after being finished with UTILITY Wall Board.



Utility Wall Board is better than lath and plaster. It saves the user a lot of money besides giving him a handsome, durable job. Utility Wall Board can be painted and decorated with the finest results. Utility Wall Board is being used in both small and large buildings. Everyone likes it.

Write Now for FREE Sample and Prices

Utility Wall Board can be applied by the carpenter—nailed right to the studs—easy and clean to handle—cuts with a saw—fits any space and can be put on in winter or summer—no waiting for plaster to dry—no cracked walls—no dirt—no ruined decorations—warm in winter and cool in summer

THE HEPPES COMPANY, 4502 Fillmore Street, Chicago, Ill.

Compo-Board

THE MODERN WALL LINING

Better than Lath and Plaster in Every Way

Compo-Board will outlast lath and plaster several times over—in fact it will outlast the building itself.

Makes absolutely dry, warm, moisture proof walls and ceiling. Cannot crack, crumble or chip off like plaster. Keeps the rooms warm in winter and cool in summer.

Compo-Board can be used in any climate. It is quickly and cheaply put on in any kind of weather—no muss or dirt or waste of time waiting for plaster to dry.

Not only is Compo-board a superior wall lining, but it has a multitude of uses in the home, around the yard, and in the office and factory.

Made of thoroughly seasoned kiln dried strips of lumber covered with a thick coat of cement and heavy durable paper put on under intense heat and pressure.

You can buy it in strips four feet wide and one to 18 feet long, any length you want in even feet.

SEND FOR BOOKLET AND SAMPLE

And you can see just what Compo-Board is, and read all about its many advantages and numerous uses.

"Stop Depreciation *BEFORE IT BEGINS—BUILD WITH CYPRESS AT FIRST!*"

"EVERYTHING CYPRESS EXCEPT THE WINDOW GLASS."

MR. GUSTAV STICKLEY, the well-known Craftsman, writes: "In my experience, CYPRESS is the best American wood for all exterior use, such as shingles, timbers, pergolas, and all woodwork subject to weather. Its slight natural oil makes it practically impervious to moisture, so that it does not shrink or swell like other woods, and is very durable when protected merely by a coat of oil. In this it is similar to teakwood, in my opinion is quite as durable, and of course much more practicable."

ASK our "ALL-ROUND HELPS DEPT." *any* question about Wood. Our reply will be frank. We recommend CYPRESS only where CYPRESS can *prove* itself "the one best wood" for *your* use.

CYPRESS LASTS PRACTICALLY FOREVER

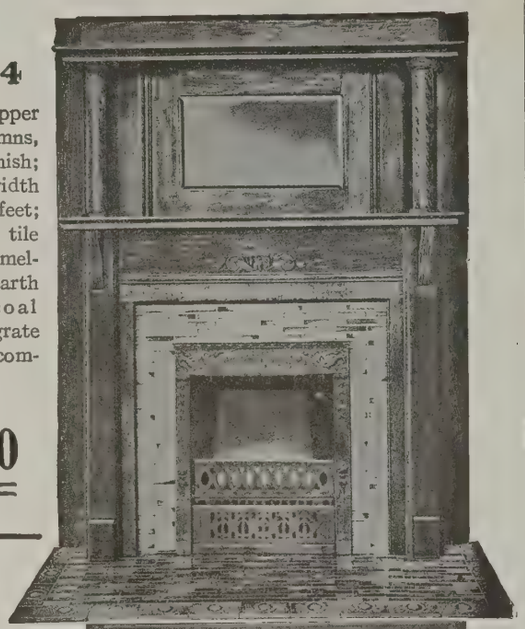
RED GUM

Library, University Club, St. Louis, Missouri

A representative of the National Builder, in conversing with the Architect of the University Club at St. Louis, was assured by him that, although the building had been erected a good many years, the RED GUM trim had continued to give the utmost satisfaction and that it was as beautiful today as when first finished. He said furthermore that RED GUM did not on aging acquire the dull dusty color which marred the beauty of other woods and made refinishing necessary.



Builders who are interested in the beautiful effects and present comparatively low cost of this most abundant hardwood will protect their own and their clients' interests in a practical manner by insisting that the RED GUM used be purchased from a concern capable of providing a guarantee that the wood has been properly seasoned and all the necessary steps taken to eliminate the sap; and furthermore, that the interior trim contractor properly fills and finishes the wood when put in place. RED GUM is absolutely reliable if properly handled.

Builders desiring to see samples of Red Gum, both rough and finished, or who wish market prices of selected Red Gum, are invited to correspond with any of the following firms:

No Other Ready Roofing Could Withstand This Test

The flame of a powerful blow-torch was placed within two inches of J-M Asbestos Roofing. At the end of fifty minutes (note clock) the roofing was not burned or injured, being only slightly blackened with smoke.

This is one of a number of tests that prove conclusively that the only permanently durable prepared roofing—the one that better than any other resists fire, acids, gases, rot, rust, heat, cold and wear is

J-M Asbestos Roofing

Other ready roofings are made of wool felt, rag stock, paper, shoddy, coal tar, and other highly inflammable materials which are an actual menace to a building instead of a protection. J-M Asbestos Roofing is the "cheapest-per-year" roofing because it requires no coating or painting to preserve it. The first cost is the only expense.

Fire-proof construction is better fire protection to a building than any amount of fire insurance. By covering buildings with J-M Asbestos roofing it will protect them from fire at no extra cost.

THE *ONLY* UNIVERSAL WOOD-WORKER FOR CONTRACTORS' USE

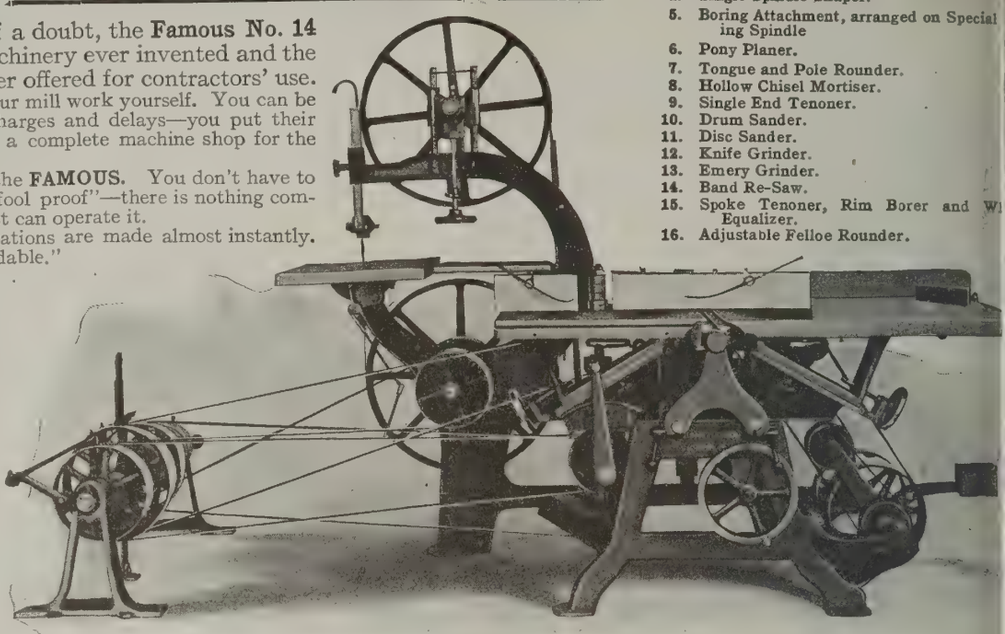
Absolutely, without the shadow of a doubt, the **Famous No. 14** is the greatest piece of wood-working machinery ever invented and the greatest labor and time-saving device ever offered for contractors' use.

With a **Famous No. 14** you can do **all** your mill work yourself. You can be independent of planing mills with their high charges and delays—you put their profits in your own pocket. You can install a complete machine shop for the price of one machine.

You don't require an expert to operate the **FAMOUS.** You don't have to fear breakdowns. The machine is absolutely "fool proof"—there is nothing complicated, nothing to wear out, and any machinist can operate it.

The adjustments for the different operations are made almost instantly. Every part is readily accessible and "understandable."

The FAMOUS No. 14



Five hundred Famous Universal Woodworkers were sold last year by **sheer force of merit.** Not one complaint has ever been made during their entire history of manufacture. No other woodworkers on earth can show such a record.

Behind the machine is our guarantee—which covers the **entire** life of the woodworker. You **cannot** lose.

Our proposition makes it easy for you to install a FAMOUS. Write today for full details, and for complete descriptive literature.

Here Are the Sixteen Machines in One

1. 27″ Band Saw.
2. 12″ Jointer.
3. Saw Table, with raising or lowering arb
4. Single Spindle Shaper.
5. Boring Attachment, arranged on Special ing Spindle
6. Pony Planer.
7. Tongue and Pole Rounder.
8. Hollow Chisel Mortiser.
9. Single End Tenoner.
10. Drum Sander.
11. Disc Sander.
12. Knife Grinder.
13. Emery Grinder.
14. Band Re-Saw.
15. Spoke Tenoner, Rim Borer and W Equalizer.
16. Adjustable Felloe Rounder.

"VICTOR" SCROLL SAW

FOR FOOT AND POWER

SUITABLE for carpenters, pattern and cabinet makers and all wood workers requiring accurate work, also for sawing soft metals. Will cut up to 3 inches thick, swings 24 inches, has powerful tread motion, cuts rapidly and is easy to operate. Has adjustable tension spring on upper spindle, dust blower, drill attachment, iron tilting table, etc. Will furnish tight and loose pulleys for power in place of treadles when desired.

This is acknowledged to be in all respects the most complete foot power scroll saw made.

We make a complete line of Foot, Hand and Light Power Wood-Working Machinery, suitable for carpenters, builders, cabinet makers, and other wood workers. It will pay you to investigate their merits.

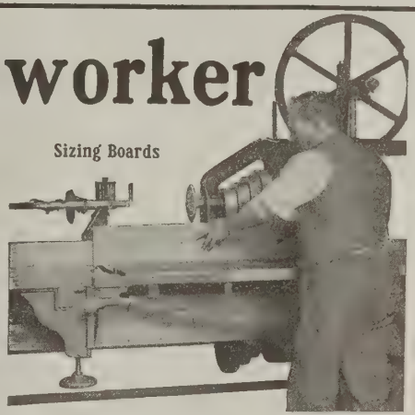
and can be used for a number of other operations common in contractors' and builders' shops as well as pattern and repair shops. All without extra attachments; simply change the tools. The lathe swings 20-in. diameter and 40-in. between centers. The Band Saw will take 12-in. under the guide. Saw mandrel will take saws up to 12-in. diameter. It will be seen from these ample dimensions that this machine is of a very practical size and substantially built. Three men can work independently at it at one time. It is practically

12 Machines in One



and is the most modern and complete Combination Woodworker on the market. It economizes space and power. Only 4 H. P. required. It provides at a moderate investment the conveniences of a large factory with high priced separate machines for each purpose. It is simple to operate; full instructions accompany the machine.

This machine is fully described in our Catalog 178 P—Section 5

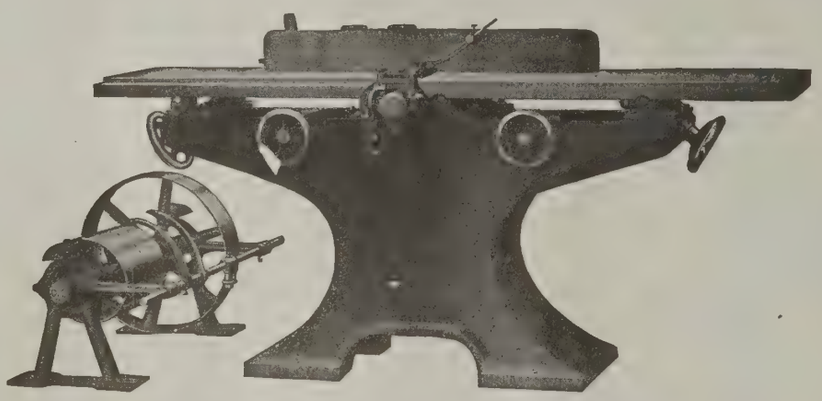
BRING the MILL to the JOB

¶ Contractors and builders are now realizing the saving in labor and time that may be had by substituting practical machines for hand labor. Labor is high and time is going on, so imagine the saving that can be made by doing the work of 6 to 8 carpenters on the Oshkosh Portable Saw Rig. Investigate the only machine of its kind having a swinging saw that can be held stationary for rip sawing. Not a light, cheap affair, but a good, heavy, substantial machine.

MANUFACTURED IN TWO SIZES:

Size No. 1.—14-inch Saws— 6 H. P. Gasoline Engine or 5 H. P. Electric Motor



Size No. 2.—20-inch Saws—10 H. P. Gasoline Engine or 10 H. P. Electric Motor

Write for special catalogue of Saw Rig.

OSHKOSH LOGGING TOOL CO., 414 S. Main St., OSHKOSH, WIS.

PROTECT YOUR FINGERS
by using a CRESCENT Jointer with Safety Head

The knives in CRESCENT Safety Heads are made of high speed steel which will hold an edge longer and turn out better finished and more work than can be done on a common jointer with ordinary knives. You may crowd the machine to the limit and the quality of work will be just the same as though you hadn't crowded it a bit.

The price of these splendid machines is very reasonable considering the very high quality of the machines and the enormous amount of accurate work they are capable of turning out.

Send for catalog giving complete description. It tells about our elegant line of Band Saws, Saw Tables, Jointers, Borers, Shapers, Planers, Planer and Matchers, Pole Rounders, Disk Grinders, Variety Woodworkers.

THE CRESCENT MACHINE COMPANY 10 MAIN STREET LEETONIA, OHIO, U. S. A.

CARPENTERS, CONTRACTORS, BUILDERS AND RETAIL LUMBERMEN

FIND OUR

NEW NO. 270 HORIZONTAL HOLLOW CHISEL MORTISER

A GOOD INVESTMENT

This is due to the fact that it will do a great variety of light and medium mortising in all kinds of wood with VERY LITTLE POWER.

A SLIGHT PRESSURE ON THE FOOT TREADLE

gives great leverage and advances the table to chisel, mortising to a depth of 6 inches. Table is raised and lowered by crank, as shown. Frame is a very rigid casting, being molded in one piece and having broad floor base, insuring a perfectly smooth mortise.

YOU ARE INVITED TO WRITE FOR LARGE ILLUSTRATED CIRCULAR

No. 270 Horizontal Hollow Chisel Mortiser

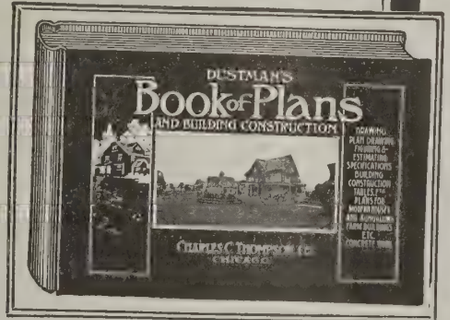
"FAMOUS FOR DURABILITY"

The Boss Improved Floor Scraper



Has double swivel allowing the knife to be set in any position. Gauge can be set for any thickness of shaving and keeps knife from making depressions in floor. Gives knife double support. The pear-shaped wheel which is in the gauge is attached to the gauge in front so that when the scraper is let down to take shaving, it lets the knife down gradually, and prevents the knife from making a deep cut. With this gauge and wheel attachment, the knife will leave no mark. Impossible to do poor work. Adjustment simple—positive. Gauge can be removed instantly. Sanding attachment. Prices very low. Write for descriptive circular.

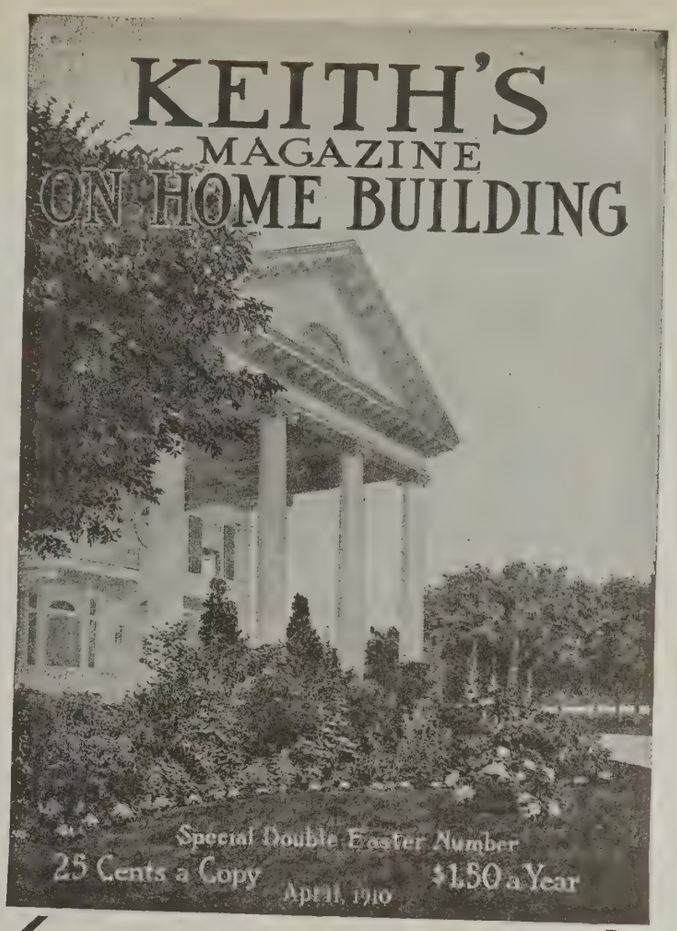
Press Reviews



The most pretentious book of plans and building construction that has ever come to our attention.—*The St. Louis Lumberman.* The suggestions offered in description and text are of a practical nature.—*The Cement Era.* The information given in this book cannot be found in any other works.—*The Lumber World.* It is more complete and up-to-date than any other book along the same line.—*The American Lumberman.* The author does not make a mistake so common in works of this character.—*Mississippi Valley Lumberman.* The book is all that is claimed for it and more, too.—*Builder and Contractor.* The book appeals strongly to the contractor and builder. The author is a well known practical architect of over thirty years' experience.—*Building Age.*

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying Out a Building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions for Mixing and Placing Concrete—Proportions—Sand and Gravel—Itemized Lists of Material Costs—Writing of Specifications.

250 pages, size 9x13, bound in blue cloth, white hand stamping. Price $2.00. You don't have to buy the Plans and Specifications to build from this book. Sold by booksellers and supply houses generally or sent prepaid to any address on receipt of price.

THE CHARLES C. THOMPSON CO., Publishers
545-549 Wabash Avenue — Chicago

A Shearing Cut Gets Best Results in Floor Scraping

Why does a mechanic when scraping a floor by hand use the Shearing Cut? Because he obtains smoothest and quickest work so. When you whittle a piece of wood you use a Shearing Cut.

A Shearing Cut is ALWAYS made with the

"DAISY" FLOOR SCRAPER

With One Ten-Inch Blade Single Shearing Cut is Made
With Two Five-Inch Blades Double Shearing Cut is Made

The "Daisy"

CUTS EITHER WITH OR ACROSS THE GRAIN
CUTS RIGHT UP TO BASE BOARD AND INTO EVERY CORNER
IS EASIER ON THE OPERATOR AS IT REQUIRES ONLY A SLIGHT LIFT TO GET BEST WORK
WILL DO MORE WORK THAN ANY OTHER IN SAME LENGTH OF TIME
WILL DO PERFECT STRAIGHT EDGED WORK AND WILL PLEASE YOU
CLAMPS ARE INSTANTLY FASTENED
FILING DEVICE FILES BLADES TO RIGHT BEVEL
EDGE-TURNING DEVICE IS A WONDER

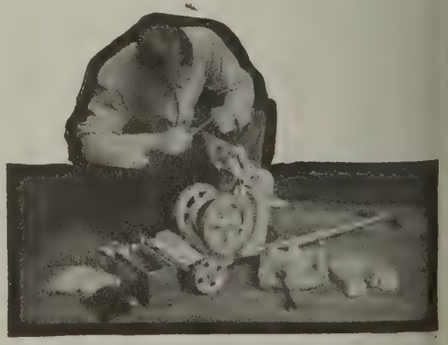
"Nothing but the Highest Praise for THE TRIPLE "A" MACHINE"

This Letter is Self Explanatory

Flint, Mich., 11-23-1910.

Triple "A" Machine Co.,
Chicago, Ill..

Gentlemen:—
I take pleasure in writing you regarding the workmanship of your mechanics in scraping the floors of the Flint P. Smith Building, this city.
I have tried out three different floor scraping machines and am satisfied that the Triple "A" was the best. Owing to the work which your men and machines were able to do, I can have nothing but the highest praise for the Triple "A" Machine.
Yours truly,
W. E. WOOD.



Surfacing Floors

(by contract)

pays when you have the proper equipment.

We can't do all the floor surfacing in the country, but we're willing to furnish the machines and give others a chance.

Any carpenter can successfully operate **The Triple "A" Spring Driven Floor Smoother**—It's easy—the motor spring furnishes power.

SHARPENING UP

Make it your business to see this machine in operation

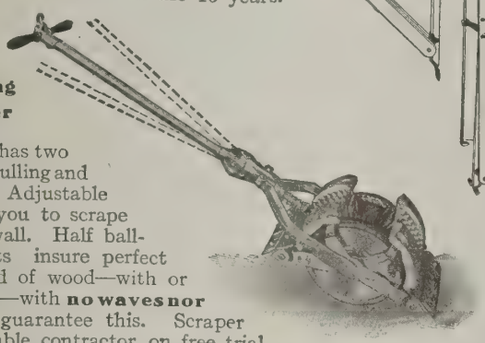
The Latest WEBER Work Savers

SAVE time and you make money. Crude tools delay work and turn out "botch" jobs. My devices are right up to the minute—mechanically correct—and you can't afford to be a day without them, Read every word of this ad; then send for complete catalog and prices. I've been a successful contractor for 25 years, and I absolutely **know** I can save you money at every turn of the road.



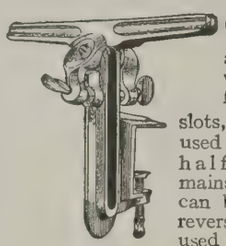
Double Scaffold Bracket

is the only one that can be adjusted for use on any kind of buildings. Will not swing sideways and has two scaffold boards which make it ideal for putting up cornices. Weighs only 22 lbs., but is much stronger than the old, heavy scaffolds. Can be folded without loosening a single bolt. When folded, 24 brackets take up space only 3 x 4 x 5 feet. In use 10 years.

WEBER

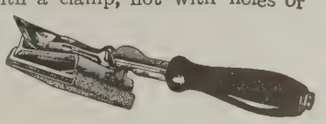
Double-Acting Floor Scraper

improved model, has two knives—one for pulling and one for pushing. Adjustable handle enables you to scrape right up to the wall. Half ball-and-socket joints insure perfect work on any kind of wood—with or against the grain—with **no waves nor chattering.** I guarantee this. Scraper ent to any reliable contractor on free trial.



Folding Saw Vise

holds the saw with rigid unyielding grip and is as nearly noise-preventive as such a tool can be made. Can be thumb-screwed to any plank or bench in an instant. When folded, it takes up no more room than a common hammer. Saves many an aching arm from using dull saws and should be in every kit.



FOLDED

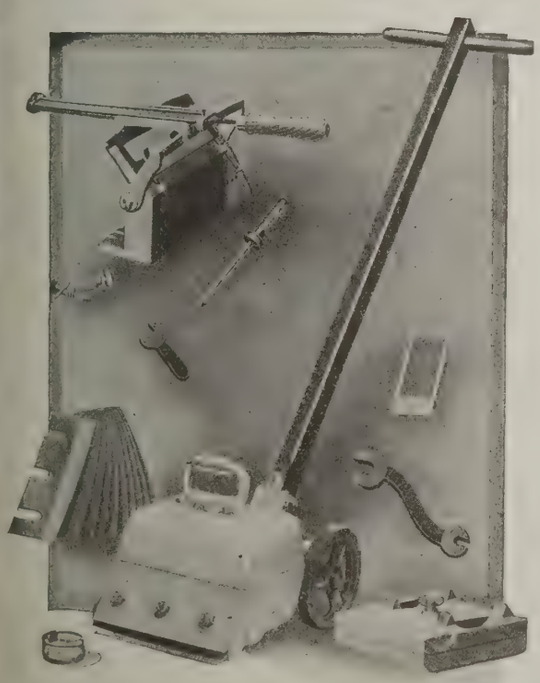
Cabinet Scraper and Sander

OPEN

affords a firm grip and can be controlled with ease in the tightest corners. Knife is fastened with a clamp, not with holes or slots, and can be used till but a half inch remains. Scraper can be quickly reversed and used for sandpapering and polishing. Weight 22 oz. Handiest tool ever made for the purpose.

Sharpening Device

for floor scrapers holds the file at the correct level for an even, true edge on Weber and other floor scraper knives. With this tool, anyone can do excellent work in short time without previous experience. Well worth investigation.



SEND FOR CATALOGUE

JOHN F. WEBER, Pres. :: WEBER MFG. CO.

661 71st Avenue, WEST ALLIS, WIS.

THE "ACME" SAVES 75%

of your floor scraping labor expense, because **one** man and the **"Acme"** can do as much work as **four** men can with hand scrapers. You don't have to take my word for this—prove it to yourself by accepting my **one week's free trial offer.**

I will send the **Acme Floor Scraping Outfit** to you on a **week's free trial** and if you don't find that the machines will save you much money and do your floor finishing better and easier than you ever had it done before, pack up the outfit and send it back at my expense.

Start the new year right by investigating into my proposition. Don't put it off, but do it now. The sooner you do, the more money you will save. Write to me for booklet and further particulars.

A few January letters

Lemasters, Pa., Jan. 14, 1911.
Jos. Miotke,
Milwaukee, Wis.
Dear Sir—Please find enclosed check for the floor scraper you sent us on trial. We are very much pleased with the outfit and find it to be entirely as represented.
Yours truly,
M. HARTMANN & SONS.

Boonton, N. J. Jan. 10, 1911.
Mr. Jos. Miotke,
Milwaukee, Wis.
Dear Sir—Enclosed please find check for your scraping outfit which you sent on trial a few days ago. It works very satisfactory and I only wish that I had purchased it years ago.
Yours truly,
W. H. GRIMES.

Florence, Ala., Jan. 10, 1911.
Jos. Miotke,
Milwaukee, Wis.
Dear Sir—The two floor scraping outfits were received on the 7th and I find them O. K. and entirely satisfactory. Enclosed please find check in full payment for same.
Truly yours,
JOE L. HOLTSFORD.

JOSEPH MIOTKE, 249 Lake St., Milwauke, Wis.

From H. Ball, Winnipeg, Man.—I am an owner of a Pearson Nailer and it is a complete success, especially this time of the year. I want to know what they will cost to agents, as I believe I **can sell them here like hot cakes.**

From Albert Heinz, Chelan Falls Wash.—I finally received the Nailing Machine and am well pleased with it. I think I will want quite a few of them this spring, as the carpenters here **don't know that there is such a thing made.**

From John G. Most, Martland, Neb.—I would like to get the agency for your Nailing Machine at this place. I have the only Nailer in this county and it is **one of the best things there is going, I think.**

COLD WEATHER TROUBLES

IN SHINGLING OVERCOME BY

PEARSON'S NAILER

for it works as well in one season as another. Wear your gloves or mittens and (with it) drive more nails than you ever did. Quit using your mouth as a nail pouch.

PEARSON NAILERS

ARE MADE IN TWO SIZES.

The Blue Nailer is for common 3d No. 14 wire nails and the Red Nailer is for the galvanized 3d, No. 13, 1¼-in. wire nails.

If you cannot get it from your dealer, order from us direct, being careful to state the nailer wanted, according to the kind of nail to be used.

$5.00 each express prepaid. Money cheerfully returned if Nailer is not as represented. Write for Circular "N."

PEARSON MFG. CO.

Robbinsdale, Minn.

From Robert Christopherson, Sioux City, Iowa.—I have one of your Pearsons Improved Nailers and can **recommend it very highly,**

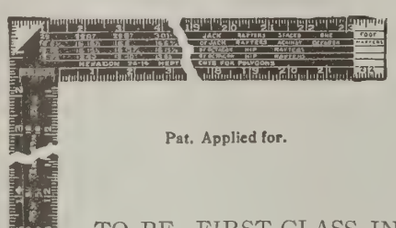
From John Miller, Wauwatosa, Wis.—I have received the Nailer some time ago; am **well satisfied with it.**

From Geo. H. Moore, Chatfield, Minn.—I have one of your Nailers and I **would not do without it.** Please find enclosed 40c for new plunger. I got this Nailer about a year ago.

From C. F. Sommercom, South Byron, Wis.—I bought a Pearson Improved Nailer of you and it proved to do such a grand work so I am **going to get another** one of them. They can be used to good advantage.

From J. G. Grimm, Garrison Iowa.—Find enclosed draft for another Nailer, the red Nailer for gal. nails; send at once. **I sold the other Nailer to a man after he tried it about 5 minutes.**

10,000



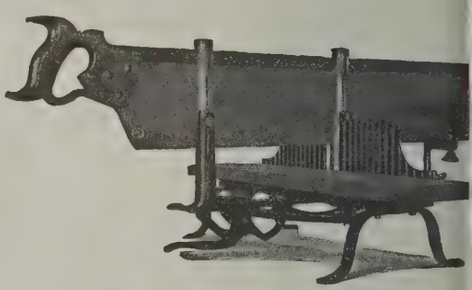
SHINGLES

Nailed in 10 hour with a PEARSON NAILER is the experience of Mr Connell:

"The Nailer more than meets my expectations, and has more than paid for itself on one job of thirty thousand shingles. With my boy of fifteen years of age I carried up and put on ten thousand shingles in one day of ten hours. Would not take $10.00 for it if I could not get another. * * *"**

P. M. Connell,
Greeley, Neb

Your experience should be just as good.



Pat. Applied for.

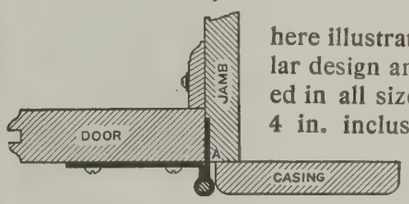
No. 450 —CUT FULL SIZE, 3½ INCH

WE INITIATE—NEVER IMITATE

A Big Hit

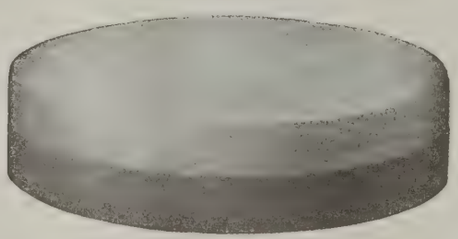
Is the new tip with which "NATIONAL" Butts are now equipped, both Common and Ornamental.



The TIP is threaded and screws into the Butt in both the Japanned and Plated finishes.

It is also SLOTTED for A SCREW DRIVER, making it easy to remove the tip and affords ready access to the pin.

The slot also indicates instantly which is the bottom of the butt—a feature greatly appreciated by the carpenter.



These are exclusive "NATIONAL" features.

Style No. 450

here illustrated is a very popular design and can be furnished in all sizes from 1½ in. to 4 in. inclusive. These butts are highly polished, double plated and have beveled edges. They match escutcheon plates with beveled edges. Ask for "Catalog B" and give dealer's name.

NATIONAL MFG. CO., STERLING, ILL.

It is Round—and It is a Wonder

The new Carborundum Carpenters' Bench Stone is just the right size for that rotary motion required in sharpening chisels, plane bits, etc. Made one side coarse grit for bringing the tool to an edge, the other fine grit for finishing. Like all Carborundum sharpening stones, it gives a better edge in less time—never fills or glazes and wears uniformly.

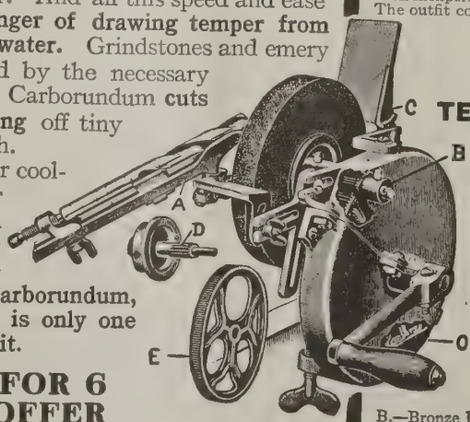
6 Months Free Trial

This Luther Diamond Tool Grinder sharpening outfit will help any shop, factory, contractor, or any carpenter, mechanic or tool user to earn more money. This is exactly what we want you to prove by six months' free use of this **genuine** Luther Carborundum Grinder shop and factory outfit. We want tool users generally to try out this outfit for six months free—to sharpen every kind and as many tools as possible free for six months, and then, if you are not fully satisfied that this outfit is a big money-maker for you, send it back at our expense. Send back the coupon at the bottom of this page for particulars of 6 months' Free Trial, and special offer on shop and factory outfit, also Free booklet about Carborundum.



25 Times Faster Than Grindstones—6 Times Faster Than Emery—Will Not Draw Temper—Not Emery Called by a Fancy Name, But

GENUINE CARBORUNDUM

WILL NOT DRAW TEMPER

Carborundum is a wonderful sharpening substance. There's nothing else like it, or near like it in the world. Nothing except the genuine diamond itself is so hard. In fact, Carborundum is made of artificial diamond crystals, actually **created** in the terrific heat of electric furnaces at Niagara Falls, which fuses the elements of real diamonds into hard, sharp, beautiful Carborundum crystals. In this **utmost** heat, far beyond the measurements of science, in which fire brick melts and runs like butter, Carborundum crystals get a temper and sharpness that cuts hardest steel as emery does copper. Wheels actually made of genuine South African diamonds would sharpen tools no quicker. And all this speed and ease of tool sharpening is done **without danger of drawing temper from tools, and with no need of cooling with water.** Grindstones and emery wear steel away; frictional heat caused by the necessary heavy contact draws the temper. But Carborundum **cuts** steel away without frictional heat, **peeling** off tiny shavings of hardest steel at lightest touch.

No need of heavy pressure, no water cooling needed, no danger of drawing temper if it is **genuine** Carborundum. And you can be highly suspicious of anything described as we have described Carborundum, but called by any name other than **Carborundum,** no matter how fancy the name. **There is only one Carborundum; there is nothing else like it.**

SEND COUPON TODAY FOR 6 MONTHS' FREE TRIAL OFFER

Often you work with dull tools because it's not easy to sharpen them. This outfit makes any sharpening the work of only a few minutes. Keen, bright tools mean faster work every moment of the day, and that means **more money made,** to say nothing about the time saved in sharpening and the money saved, because there is no danger of drawing temper, and all your tools will last longer. The Carborundum wheels will outlast any number of emery wheels or any other abrasive. We guarantee the wheels for five years. But don't take our word; let the outfit itself prove all this in your own shop, on your **own** tools. If you don't want it after six months' free test, send it back. The six months' use will cost nothing.

Send back the coupon today and get our liberal Free Trial offer, also interesting story about the discovery of Carborundum, reprinted from McClure's Magazine.

RETURN THIS COUPON

LUTHER GRINDER MFG. CO.

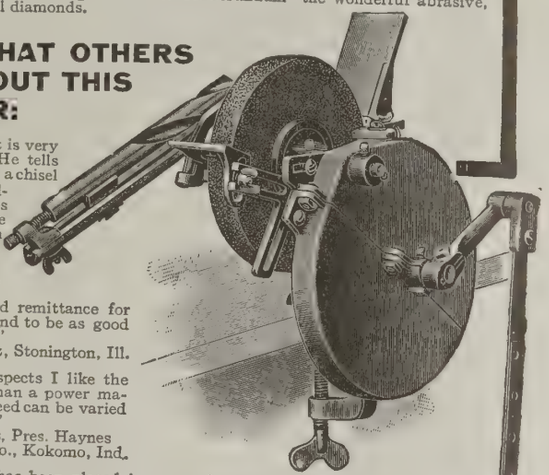
Special Offer on Shop Outfit

LUTHER DIAMOND TOOL GRINDER



This genuine Carborundum Sharpening Outfit is a remarkable value—the most liberal, reasonably priced outfit ever offered. It provides for every kind of sharpening, buffing and polishing work. The coupon below will bring you our Six Months' Free Trial Offer, and Special Outfit Offer, also a reprint of an interesting article from McClure's Magazine about Carborundum—the wonderful abrasive, made of artificial diamonds.

READ WHAT OTHERS SAY ABOUT THIS GRINDER:

"Our machinist is very much pleased. He tells us that he ground a chisel on this tool grinder in two minutes which would have taken an hour on the grindstone."
W. H. Sears,
Pentwater, Mich.

"Enclosed find remittance for grinder which I find to be as good as recommended."
S. Schrantz, Stonington, Ill.

"In many respects I like the machine better than a power machine, since its speed can be varied instantly at will."
Elwood Haynes, Pres. Haynes Automobile Co., Kokomo, Ind.

"The grinder has been placed in our work room and proves satisfactory. I heartily recommend it."
George Leonard, Pioneer, Ohio.

"We consider your Mechanics Special the best thing on the market for grinding tools. It will give us pleasure to recommend the grinder to our friends."
MacLean & Carrick, Palmer, Mass.

10 TOOLS IN ONE

The Mechanics' Special Shop Outfit, on which we are making this special offer, embraces ten sharpening appliances. The special attachments make it easy for even inexperienced persons to do difficult grinding, such as twist drills, chisels, etc. The outfit consists of one Mechanics' Special, with the following accessories:

WILL NOT DRAW TEMPER

1. One rough genuine Carborundum wheel
2. One fine genuine Carborundum wheel
3. One Chisel grinding attachment
4. One twist drill attachment
5. One buffer
6. One polisher
7. One genuine Carborundum oil stone
8. One genuine Carborundum hone in leather case
9. One genuine Carborundum sickle stone
10. One foot power attachment

BUILT LIKE A HIGH GRADE LATHE

The Luther Mechanics' Special, forming the basis of this shop and factory outfit special offer, is built substantially for a lifetime of service. The genuine Carborundum wheel will not get lopsided. The Mechanics' Special is built with steel and malleable construction—dust-proof, bronze bearings—machine parts run in bath of oil—machine cut spur gears—speed 2,500 revolutions per minute. It will stand the severest, hardest service, out-wear and give better service than any number of emery wheels, grindstones, or anything else.

A.—Twist drill attachment to give twist drills proper angle and clearance.
B.—Bronze Bearing. C.—Chisel Sharpening Attachment.
D.—Spur gear cut from solid steel.
E.—Large spur gear machine-cut, oil bath.

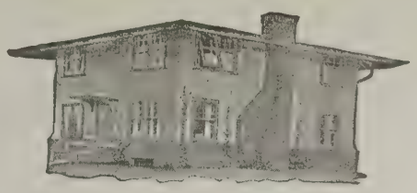
Hess, 907 Tacoma Building, Chica

MORE HEAT AND LESS FUEL



This shows the Jahant Down-Draft Furnace without the casing, pipes, etc. The air enters the inlet marked "Draft" and rises through the two cast iron smoke-proof pipes that lead to the top of the fire box. Being colder and consequently heavier than the air directly over the fire, it falls and forms a down draft through the center of the fuel until it becomes heated and rises to the service pipes. The Jahant Down-Draft Furnace consumes every piece of fuel to a fine ash and liberates every unit of heat.

$10 Down Send us $10 with plans of the rooms you desire to heat and we will send the proper sized Jahant Down-Draft Furnace with full instructions for installing. You can pay the balance in monthly installments. Write for our big furnace book. It is free.

It will pay you to investigate our proposition which enables you to make the profit that would otherwise go to the heating contractor. Send us a rough sketch for an estimate on your next job. We will quote you a net price or quote price to your customer, allowing you a commission. Let us help you make money.

REGURGITATING SAFETY VALVE

makes your radiators one-half hotter in very cold weather. It makes Andrews Hot Water Systems heat up your house as quickly as steam without any steam plant disadvantages; stops "boiling over." It is simple, automatic, safe.

TEMPERATURE CONTROL

Andrews Thermostat keeps the whole house at 70 degrees or any other point you wish. It watches the fire and operates the dampers, saving you all bother. Accurate, absolutely dependable. Guaranteed for life.

OVER

500 MILES OF ANDREW SYSTEMS IN 44 STATES

ANDREWS LOCOMOTIVE STEEL BOILER

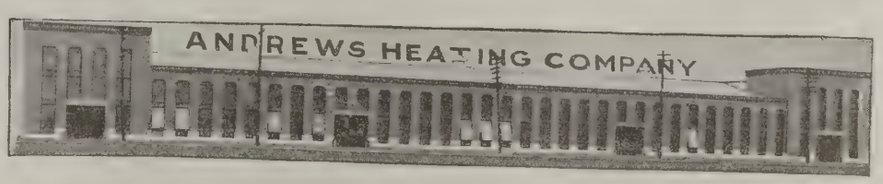
is made of the strongest steel plate like big power boilers, is easiest to clean, has more than two times as much heating surface and fire travel as other boilers. It costs more but will save you from $20.00 to $200.00 on coal bills yearly. Ask users near you.

How to Get an Andrews System

First send us a rough sketch or architect's plans of the house to be heated, giving size of rooms, windows, height of ceilings and construction, and get our **free estimate** of cost complete. The plant is then made complete in our factory and shipped "knock down" either to you or to your customer, as you prefer. We pay freight and furnish a 360 Days Free Trial Guaranty Bond. For your services we allow a very fair commission.

OUR HOT WATER ENGINEERS

are famous. From your rough sketch or architect's plans they design your complete hot water system, make it complete in the factory and ship it to you "knock down" with such complete and simple directions that you, your carpenter's helper or any handy man can put it in.



OUR BIG FACTORY

has capacity of 3,000 Systems per year. It is equipped with special tools and labor-saving devices, which reduce cost and furnish much better plants. We sell direct from factory and save you jobber's and middleman's profits.

HEATING, PLUMBING, WATER SUPPLY and SEWAGE DISPOSAL

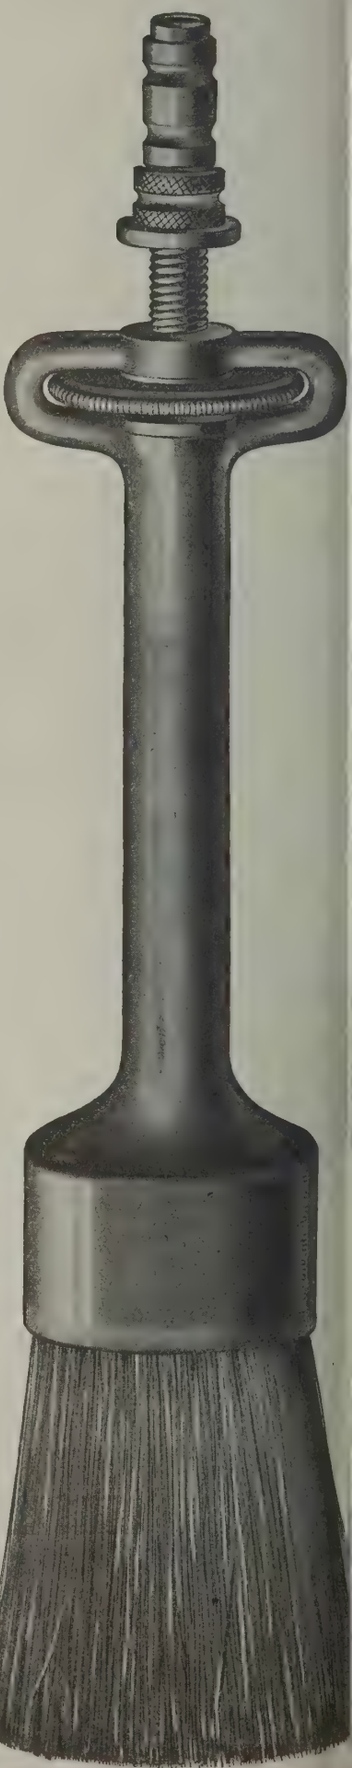
The Standard Automatic Brush

does your painting work in a new way, better, quicker, cheaper, eliminating all waste of paint. An equal flow at all times; thickness of coat can be accurately adjusted. Absolutely clean and fireproof.



Jobbers and Dealers Wanted Everywhere

The STANDARD AUTOMATIC SYSTEM does away with the paint can. It eliminates the dip and is far superior to the spray, but it does rub it in. No air pressure is needed. Will work with any kind of paint. Get next to this new method. Made especially for manufacturers of automobiles, automobile bodies and wheels, all kinds of vehicles, carriages etc. is most useful for manufacturers of furniture. It will also save a lot of time in painting structural work, such as bridges elevated roads, etc. House and sign painting can be done effectively and quick.

Wherever duplication of work exists, this device will increase your output and reduce the cost. Buy just one outfit today and be convinced. We are sure that we will have to equip your entire plant. Special equipments can be made to suit your purpose.

Complete outfit consisting of a large paint tank, either stationary or movable, with automatic valve and six feet of flexible tubing, together with the automatic adjustable brush made of aluminum, costs $7.50 and it is still cheaper than the ordinary brush. The outfit is also made with a tank to be strapped on the back which will cost $2.50 extra. Our booklet will tell you why. Write for one today. Send in your order. Your outlay will only be once. Apparatus will last a lifetime. Let us know today what you are manufacturing and we will effect a saving for you.

DRAW GOOD PLANS and DRAW GOOD MONEY

WITHOUT DOUBT many readers have in the past wished to be successful, first-class Draftsmen and Designers, and probably often looked for a long time at plans and drawings, trying very hard to figure out certain lines, or experienced an intense desire to be able to do the best work in most up-to-date manner; and many men in most any kind of business, especially in Architectural lines, have often felt greatly embarrassed simply because unable to read even a simple sketch or unable to make any kind of business-like drawing.

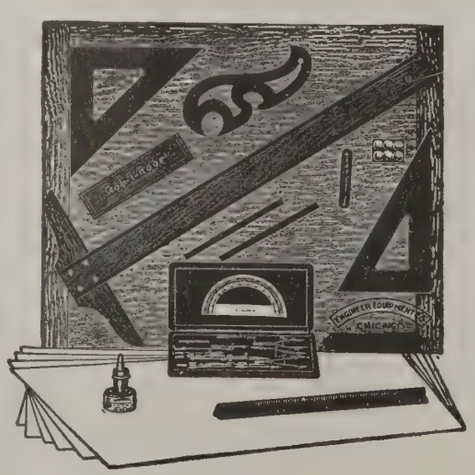
No carpenter is first-class and competent unless he is an A-1 Draftsman in addition. Without this knowledge he can never rise any higher and will remain only a Carpenter paid by the hour or day.

To become a successful Draftsman it is necessary, first of all, to receive the most practical and personal training. Not a lot of school or book knowledge, but practical Drafting-room work.

Mr. F. B. Dobe, Chief Draftsman of the Engineers' Equipment Company (inc.), Chicago has for many years made a practice of giving personal and individual Drafting instuction in complete Architectural drawing and Building design; and is prepared to accept a few more personal students, young or old. His instruction is given by mail, but must not be compared with ordinary "for all alike" correspondence school lessons, as all the work is laid out personally by himself and prepared especially for your individual requirements and advancement. He treats each student according to the student's ability; and with his individual practical method, which consists of actual Architects' work.

INSIDE OF A DRAFTING ROOM

Where draftsmen Draw from twenty-five to seventy-five dollars per week



GOOD DRAFTSMEN IN DEMAND

JUDGING by the manner in which many carpenters and contractors are getting in communication with Mr. F. B. Dobe, of the Engineers' Equipment Company, and signing up for his personal instructions in architectural draftsmanship, they are realizing the necessity and pleasure of making more money. The opportunities offered today for ambitious, wide awake and progressive men capable of making from $25.00 to $75.00 per week as architectural draftsmen are better than ever. The immense amount of building which is going on and the increasing demand for more and larger structures, gives the man with actual drafting room experience splendid opportunities for steady employment at high wages, besides the chance for advancement. There is no class of men who make better architectural draftsmen than the carpenter and contractor. The experience gained by actual work on all kinds of buildings makes it much easier in studying and also in holding a responsible position afterwards. No employer cares for diplomas—neither does he care or will pay big wages to just a mere copier. What the employer wants today is originality and practical ability, and this requries practical training. The quickest and best way to be trained on practical drafting room work and to get the required practical experience is to receive personal and individual instruction from a high grade practical man at the trade, with a reputation as the most experienced man in training men to become competent and successful draftsmen.

Mr. F. B. Dobe

An ordinary draftsman, not even the best draftsman, can teach this trade unless he has had many years of experience as an instructor, and has ability to impart knowledge that is understood and will stick forever. A special gift that 99 out of 100 do not have.

This Outfit, value $13.85, furnished free by Mr. Dobe to his students

Mr. F. B. Dobe, chief draftsman of the Engineers' Equipment Company (Inc.), Chicago, with twenty years' experience in training and handling men, has for a good many years given personal individual instruction by mail with the most deserving success, because his instruction work consists of actual drafting room work that gives his personal student and apprentice the required practical experience.

Mr. Dobe has been an advertiser in this paper for a good many years and will send his "Successful Draftsmanship" prospectus, 6 by 9, also list of open draftsmen positions and full information free. His advertisement appears on last page of this paper. Anyone interested should write to him.

This is why you can't Extract a Star Expansion Bolt

IMPOSSIBLE! Note where the hand is pointing. This shows the beginning of the celebrated "inner end expansion" which has made the Star Expansion Bolt famous as a hold fast forever fastening for wooden cross beams, girders, all ornamental iron and wood work. TO USE: Insert malleable iron shield in hole in wall and place fixture; run screw through fixture to be attached and on into shield in wall and fasten tight.

As the screw is tightened the teethed jaws of the shield spread apart driving their projections deep into the wall on either side.

Every carpenter and contractor should have a copy of our beautifully illustrated 70 page catalogue number 30 and free samples.

"Write while the iron's hot."

THE DESPLAINES MANOR HOUSE

NATIONAL BUILDER DESIGN No. 338

W. E. Perry Architect, Chicago

For Floor Plans, Elevations and Details, See Supplement of This Number. Estimated Cost, Architect's Fees Not Included, $3,398.00

THE DESPLAINES MANOR HOUSE

THE house shown on the supplement sheet this month is one of a dozen designed for Desplaines Manor. It is of cement plaster, rough cast with foundation walls and footings of concrete, and cement block watertable. The basement has cement floor. The roof is shingled. The plan is equally divided between the main part which has two roomy chambers on the second floor and the single story extension. The varying heights are just enough to give interest and character to the design which is essentially of a bungalow. Clever touches by the designer are shown by the hips of the gables, the flare of the roof of the extension, the quaint dormers, the treatment of the bays and of the substantial porch. The first floor has a central hall and living room with its brick mantel at the left, the dining room with its four part mullioned window is on the right. Back of the dining room is the kitchen with china closet of good design. Two chambers and bath room complete the first floor plan. The house is direct, convenient and economical in plan. The design is pleasing and original without the eratic treatment often shown in suburban architecture. The architect was W. E. Perry, of the firm of Perry & Thomas, Chicago.

THE BUNGALOW

The accompanying design has been designed to meet certain requirements. The elevation shown is that facing road, the wall or hedge enclosing yard being omitted. The elevation to garden might be somewhat simpler. I think, whenever practicable, it is preferable to have a separate room for bath, etc. The arrangement shown is simple. The w. c. is so arranged that it may be used from inside or outside of house. The washing copper and sink may be cut off from view when not in use. If preferred the space of bathroom, etc., may be utilized as a scullery with direct access from kitchen. Hot water to sink and bathroom may be applied by one of the several systems in use. A good storeroom, etc., may be had over bathroom and kitchen. Materials: Brick outer walls built with cavity, with tarred plinth, remainder "color washed." Roofs either covered with "Ruberoid" or diagonal "compo" slating. In regard to patent partitions, these are chiefly of value where space is the main consideration.

BUNGALOW.—BY COSMO.

It is said that war destroys thousands of lives and millions of dollars worth of property—but war only stalks through the country at long intervals. Everybody deplores war—its appalling death role—its destruction of home and property, and the long trail of famine and misery and suffering that follow in its trail.

* * *

Did it ever occur to anyone, that while war with all its horrors and sufferings, was hardly a second in the cause of suffering, distruction and disaster? The loss of life and property by fires, that may be said to be preventable, is greater several times over on the average, than that caused by war. The hundreds of millions of dollars that are lost each year in the United States is appalling—particularly when we feel that these fires, or a great portion of them at any rate, are preventable, if proper steps were taken in this direction. * * *

A week or two ago we got news of fires in Chicago and Philadelphia that cut off over 40 lives and a few days previous to that a great fire took place in Cincinnati. Going back a month or so earlier we have an account of a big disaster in Newark, where a large number of youthful lives were hurled into eternity at a moment's notice. Hardly a day passes on the continent without a record of fire losses amounting to hundreds of thousands of dollars—and in many cases the loss also of precious lives. Why is it that in America the fire losses are so greatly in excess of those in the countries of Europe? The answer is on the very surface of things. The European building is constructed to last. Its stairways are generally of solid stone; its elevator shafts—when it has any—are cut off from the building served by heavy walls, the fabric of the building is massive, and the governmental and municipal laws are so stringent and so well enforced, both as to the height of the building, and the material used, that fire seems to be almost impossible.

* * *

One is inclined to ask: Are the lives of American citizens of as much value to the Commonwealth as the lives of the European citizens are to their various governments? We believe they are. Indeed, we believe they are of greater value, and our whole immigration policy and progressive laws tend to prove this. Why then should not the lives of the American citizens be protected by every possible safeguard, furnished by the resources of civilization?

* * *

On this continent we are just beginning to build for the future. The great bulk of the inside finishings in our present buildings are almost as inflammable as a planing mill. The profusion and economy of American wood have led to its utilization on a scale that has no parallel in Europe. The free use of electric power is far more extensive in America than in the old world, and wires conveying high voltage are carried into buildings in a rough and ready way, that make immunity from fire through defective installation almost a providential matter.

* * *

The great loss of property yearly has stimulated the fire insurance companies to pass such rules and enforce such usage as they think will best protect their interests, but no company has made any effort to make and enforce rules for the protection of the lives of the inmates in the buildings that have as yet had any effect on the method of building. True, the federal, state and municipal authorities have passed many laws—good, bad and indifferent—for this purpose, but the lack of stringent enforcement of these laws has rendered them in a great measure nugatory. Surely the time has arrived when disaster after disaster follow each other as they have done this last year, in rapid succesion, that something should be done, and done earnestly and effectually, to stop this dreadful slaughter of the innocents.

We are rich. We are human. But unfortunately we continue to wait for some other person to start a campaign in the interests of humanity along these lines. Buildings can be made fire-proof, notwithstanding all talk to the contrary, and it is only a matter of dollars and cents against precious lives. It is now time that lives had their innings.

* * *

We do not hold any brief for the makers of steel and cement; but it is quite evident that these materials in the near future must to a very large extent, replace wood in the construction of buildings. The supplies for these materials are inexhaustible and their cost is within such economic limits as to admit of their use in all sorts of buildings. There can be no doubt but that a freer use of these unburnable materials will tend very much to reduce the risk of fires and therefore prevent loss of property and the snuffing out of innocent lives.

There is a big engineering contract to be allotted shortly in New York. It is for the construction of forty-four miles of subway, with 133 miles of rails. Twenty-three firms have submitted tenders. The estimates prepared for the scheme contain some colossal figures. The excavation of no less than 9,000,000 cubic yards of earth and rock, the use of nearly 2,000,000 cubic yards of concrete, and over 200,000 tons of steel, are included in the items. Thanks to the playful energy of the statistican who has been revelling in these big figures, we learn that if the excavated material were built up in a column, with a base of 100 feet square, it would rise to a height of 920 feet; the concrete to be used similarly stacked would reach a height of 186 feet; and the steel would either form a cube with faces 67 feet square, or would furnish a railroad track of 2,280 miles.

HANDLING CONCRETE IN COLD WEATHER

By D. C. BABCOCK

IT MAY be of interest to some of the brother mechanics to have a few pointers concerning a method of handling concrete in freezing weather.

The method I give in the following article is taken from actual experience, and copied from my daily memorandum, and has given very satisfactory results, and as well not over-expensive.

You should not think for one moment that you can install concrete in cold weather and protect it from the power of the frost for the same money that you could do the same work in the summer time, for it is impossible, just as much so as if you were expected to build a cellar wall that would be proof against the frost in the north to one erected in the southern climate.

My intention is simply to give the readers of THE NATIONAL BUILDER my method, which has proved satisfactory at a trifle increase of cost.

In the first place you should be particular to choose a quick-setting brand of cement, for the quicker concrete is set after being placed in the forms, the shorter time you will have to protect it.

Next in order is the gravel. Be sure that your gravel is composed of clean, sharp sand and stone, and is free from any foreign matter, as loam and other soils mixed in the gravel tend to retard the setting qualities of the cement.

If you are using bank gravel in place of sand and crushed stone, it should be run over a screen of not larger than ½-inch or ¾-inch mesh, and the proportion be rated by the cement and sand, as the cement and sand form the proportion of the concrete. Then you must use your own judgment as to the amount of stone; use all the stone that the cement and stone will furnish mortar, to make a thoroughly mixed aggregate, with plenty of mortar to make a good solid mass when well tamped.

Care should be taken in keeping the forms wet ahead of the concrete, and the top of the footings wet and sprinkled with dry cement to insure a perfect weld between the old concrete and the new.

It would be well if you have any surplus stone to warm and throw them into the concrete when filling the forms, as they will help to keep the mass warm.

In using cement in cold weather you should make arrangements for a steam line, where it will be convenient to connect to it by the use of a hose, thus enabling you to heat the water, and also by laying two or three lines of ¾-inch pipe about 2 feet apart on the ground, you may pile your gravel upon them when unloading same; and by turning steam into the pipes you will keep the gravel free from frost.

Care should be taken that the water is not too hot when applied to the cement, as boiling water retards the setting qualities of the cement.

You should place the concrete in the forms as quickly as possible after being mixed to prevent it being chilled before it goes into the forms.

It should be well tamped and spaded along the face of the form to insure a perfectly smooth finish when the forms are removed.

In case of intense cold weather you had better use one pail of salt to each yard of concrete and protect it at night by spreading paper over the top and all exposed surfaces, then covering the same with straw.

If light material is used for sheathing the forms, it would be advisable to bank the forms with some material to protect the face from frost.

It is necessary to use great care in protecting the concrete for the first 12 or 15 hours.

If necessary to remove the forms before the concrete is thoroughly set you should protect it for a reasonable length of time to prevent face scales. In case it does get touched by the frost, do not feel badly about it and think it is a failure, but after the frost is out of the wall scrape off all that is loose and mix some cement and sand, about 1 to 2, and apply to the spots after same has been washed and sprinkled with dry cement.

All places of leaving off at night should be treated with warm water and cement before starting to deposit concrete in the morning; and be sure to work the new around all places to insure a perfect joint and a good connection.

After removing the forms all exterior faces should be well rubbed with sandstone, or, if not too hard, a small block of wood will do the work, and follow this operation with a solution of cement and water mixed about like paint. Apply this solution with a white-wash brush. You should brush perpendicular on the wall from top to bottom, or from bottom to top, and after partly dry this operation should be repeated, and you will have a perfectly finished face, the color of stone, with no joints or patches visible. In case you desire a lighter color you may add a little lime to your cement wash and produce as light a finish as desired. The latter finish is more desirable for cellars, and where it is desired to produce as much light as possible.

Please bear in mind that if your wall gets touched by the frost to remove all loose concrete and patch same before the rubbing process.

By following the advice given concrete may be used in freezing weather as safely as at any time, but you must bear in mind that the same brand of cement does not set as quickly in cold weather as it would in warm weather.

You must watch your batch and note the working of the same, and not think this formula cannot be changed, for it may act altogether differently under different circumstances.

I will try and take up a different subject in our general construction line in the near future, as different experiences are sometimes helpful to others.

Edward W. Redfield, the noted painter, said at the Art Club in Philadelphia, apropos of picture prices:

"I am glad there are not many buyers like an old farmer in Center Bridge.

"A very distinguished etcher, sketching in Cedar Bridge, made a study of the farmer's barn. The farmer happened to appear and said he'd like to have the sketch.

" 'Ef 'tain't too dear,' he added cautiously.

" 'Oh,' said the etcher, who makes $12,000 a year, 'I won't charge you anything for the sketch, but——'

"His eye lighted on the pig pen.

" 'But I'll tell you what. You give me one of those nice little pink suckling pigs there.'

" 'Why, man,' said the farmer with a frown, 'do ye know what them pigs is worth? They're worth a dollar apiece.' "—Los Angeles Times.

MAKING GARDEN ORNAMENTS IN CEMENT

By G. F. RHEAD

THE making of garden ornaments in cement is quite within the scope of the average worker who has an hour to spare occasionally, and the objects may be put to use with excellent effect in a garden. A little ability for forming curves is necessary if one intends to ornament the object, otherwise the work is straightforward, and requires only care to accomplish. Cement is quite simple to work, more so even than plaster, for it does not set so rapidly, being workable for about two hours after being mixed.

The necessary tools consist of the ordinary carpentry ones, two or three steel tools employed by plasterers (Fig. 1), a trowel, a laying trowel (Fig. 2), and a board on which to mix the cement

FIG. 4—DESIGN FOR PLANT POT ON PEDESTAL

FIG. 5—DESIGN FOR PLANT POT ON PEDESTAL

(Fig. 3). The latter consists of a piece of smooth wood about 2 feet square, with three sides about 2 inches high to safeguard the cement in mixing.

Figs. 4 and 5 show two plant-pots on pedestals, of such design that offers no great difficulty in execution. Fig. 6 shows the elevations with dimensions; but, of course, these may be altered to meet requirements.

In making the ornaments (Fig. 4), the construction of the cylindrical shaft should be first taken in hand. Join together three boards 1 inch thick to form a square 2 feet 4 inches. A piece of iron piping 3 feet 2 inches long is passed through the center of this, and made to project 2 inches at the other side. The projecting piece is inserted in a hole drilled in another board cramped on

Fig. 1.—Tools for Cement Work.

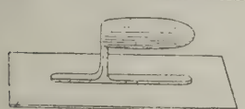

Fig. 2.—Laying Trowel.

Fig. 3.—Board on which to Mix the Cement.

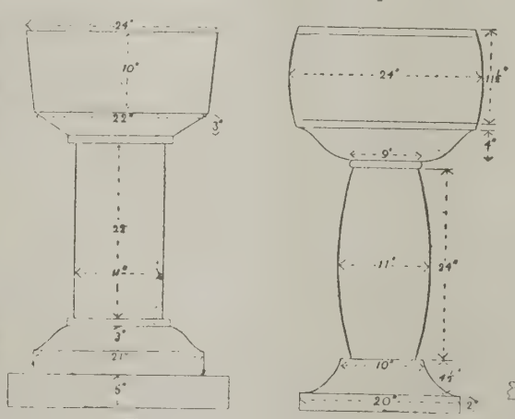

Fig. 6.—Elevations of Plant-pots.

the working table, a little blacklead being introduced between the two boards, so that the upper one may revolve freely (see Fig. 7). Now build up all round the rod a mixture of broken brick 1 part, cement 1 part, the pieces of the brick being no larger than a walnut. This rough work is continued to about 2 inches from the correct diameter of the shaft, it being usual to diminish the quantity of brick as the surface is approached.

Next cut a mould consisting of a board with a straight piece cut out the length of the cylinder, this being fixed vertically with the baseboard at a distance of 5½ inches from the center (see Fig. 8). Then continue to lay on neat cement until it is of sufficient thickness, and true up by turning it against the mould. The work should then be left for about twenty-four hours to harden somewhat, when any slight irregularities in the cylinder, such as scratches caused by lumps dragged over the surface, may be filled in and leveled with one of the steel tools. Then build up the cement base to a height of 1 foot from the ground and a little within the wood base. This must be left for an hour or two to harden a little, a template being cut in the meantime to the shape of the moulding. The template is cut in sheet zinc and mounted to give strength, on a piece of wood, which is cut to the same shape, but sloping away from the cutting edge. These are nailed together, and a guide is fixed at right angles, and made rigid with a strut (see Fig. 9), a second guide being nailed or screwed on it to form a rebate. This rebate fits aginst the edge of the wood square at the bottom of the shaft, the template being drawn along the cement to shape it, and when this is completed set aside to harden.

To form the plant-pot there will be required a box mould of wood, of the shape shown in the elevation (Fig.6), the inside measurements corresponding with those shown, which will present no great difficulty, but will require great care in the setting out of the sloping sides. The wet cement is laid in the mould round the sides to thickness of about 3½ inches, also at the bottom; and after a day has elapsed the wood may be broken away and the cement faces

FIG. 10—EARLY CHRISTIAN FONT

FIG. 11—EXAMPLE OF CELTIC INTERLACED ORNAMENT

smoothed up, the laying trowel being found particularly serviceable for this purpose. The bottom of the pot and the top of the shaft must be perfectly level, a hole being drilled in the center of the pot for the insertion of the projecting 2 inches of iron pipe. The small square moulding is added in cement at the bottom of the pot with the laying trowel, and is trued up with the help of a try-square.

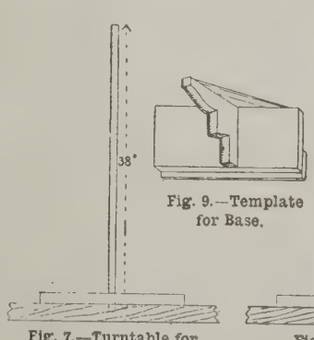

Fig. 7.—Turntable for Working Cement.

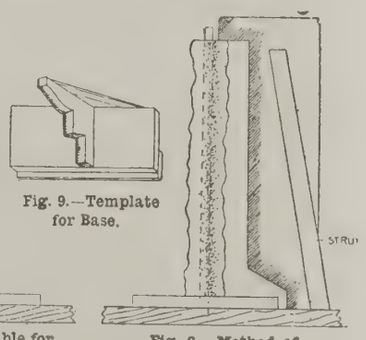

Fig. 9.—Template for Base.

Fig. 8.—Method of Turning Shaft.

This completes the plain form of the object, the ornament being now drawn out full size on paper, the ground of the design being cut away where possible to form a silhouette. This is laid on the surface of the cement, and traced round with a steel point. Use one of the tools illustrated to cut away the ground round the interlaced work, the sunken part being leveled with the central tool in Fig. 1.

A variety of effects may be produced merely by scratching away the cement, but corrections and additions may be made by applying fresh cement where required. In the illustration shown the

shaft of the pedestal has been stippled over with a little cement to give roughened texture, which has a rather better effect than a perfectly smooth surface.

The ornament in Fig. 5 is made on an exactly similar plan, with different shaped moulds, except that the pot in this instance is turned instead of being made in a box mould. The hollowness is obtained by building the cement round a conveniently shaped earthenware vessel, which requires to be plentifully oiled to facilitate removal when the cement has set.

A great variety of designs for these and similar objects may be found in the South Kensington Museum among the ancient works, and it only requires a little taste to turn these beautiful things to account in modern decoration. Fig. 10 shows a very early Christian font, the ornamentation of which would indeed be very suitable for the purpose in hand. If the worker possesses the ability to adapt, a great deal can be obtained from these early examples, which in many ways would be most difficult to improve upon. Fig. 11 gives an illustration of a piece of Celtic interlaced work, which would be particularly suitable for executing in cement in the manner described.

CONSTRUCTING A SPORTS STADIUM

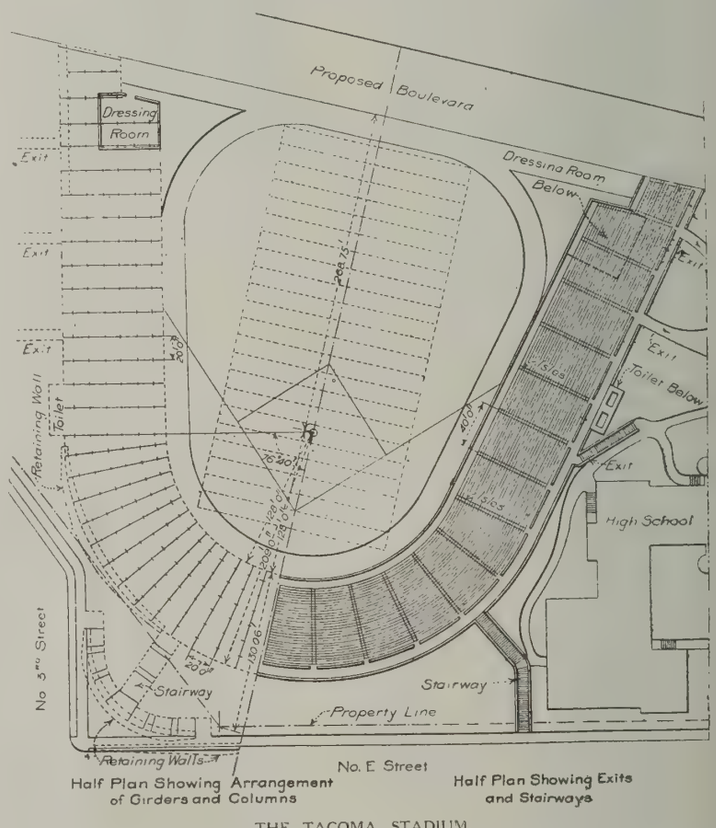
IN Tacoma, Wash., there has just been completed a high school stadium with an estimated seating capacity of 30,000. The plan was finally arranged in the shape of a U with diverging legs, the open end overlooking Puget Sound. At the bottom of the seats was placed a walk, and at the top a promenade, both running entirely around the stadium. The running track, having five laps to the mile, was arranged so as to have easy turns; and with a straight-away at the open end of the stadium, to accommodate the 100-yard dash and the 120-yard hurdle race. With E street above the stadium at an elevation of about 240 feet above sea level, the finished field was arranged at an elevation of 140 feet, and the level of the promenade 50 feet higher. Around the stadium the earth was sloped, with an inclination of 1½ to 1, to the parapet wall of the promenade. At points where the height was too great to allow of the inclination in the available run, retaining walls were provided. At the open end of the field the earth was sloped from the level of the field with an inclination of 1½ to 1. This was only a temporary arrangement. When the proposed boulevard is built, a retaining wall will be built at its outer edge, and an ornamental iron fence will be built at the open end of the field between the stadium and the boulevard.

The water falling on the seats was drained to the lower walk, in which outlets were provided at intervals of about 39 feet on the straight, and 30 feet on the curved part. From these outlets the water was carried in 3-inch pipes to a sewer pipe just inside the inner parapet wall. Tile drains were placed behind all retaining walls. These drains were carried under the superstructure down to the field, there joining the field drainage system.

In the field the drainage is very simple. All around the outside of the field was carried an 8-inch sewer pipe, which receives all the water from behind the retaining walls and the drainage from the seats. In the middle, and running the full length of the field, was run a straight line of drain tile varying in size from 3 to 6 inches. On either side, eight branches of 3-inch tile were carried to the edge of the field. At the open end of the field, all drainage was carried to the extreme eastern part of the stadium, there passing through a sand trap, and joining the drainage system of the high school building. This was done in order to leave all drainage undisturbed when the boulevard with its retaining walls is built. The sewage from the toilet and dressing rooms has a separate system of drainage, and was similarly disposed of.

In the inner wall of the promenade were placed 28 ornamental iron posts, each carrying a torch lamp with a powerful reflector. On cables stretched across the field were suspended 12 other lamps of the same type.

A large portion of the ground upon which the stadium was built was a cemented gravel, but in other parts a very deep fill was found. In the filled parts it was necessary to drive piling for a foundation. The piles were well seasoned fir with a minimum diameter of 10 inches at one end and 14 inches at the other. In driving the piles a penetration of 5 inches was allowed under the last five blows of a 1-ton hammer falling 20 feet. The ends of all piles were treated with carbolineum.



The superstructure was carried on piers, of which there are six in a row, spaced as shown on the sectional drawing. The cemented gravel has a safe bearing value of 8 to 10 tons per square foot, but on account of the shape of the structure, this was not a factor in designing the footings, which were made of plain concrete.

All concrete was of a 1/6 mixture, using sand and gravel, the aggregate being so proportioned as to obtain the maximum density. In the stadium proper mild steel rods, Clinton fabric, and latticed steel beams were used as reinforcement. In the retaining walls it was thought better to use bars having a mechanical bond, and in these corrugated bars were used. In the stadium proper, with these conditions, the following assumptions were made:

The live load on the seats was taken to be 80 pounds per square foot, and on the promenade and lower walk 100 pounds per square foot. Full dead and live loads were figured on all members.

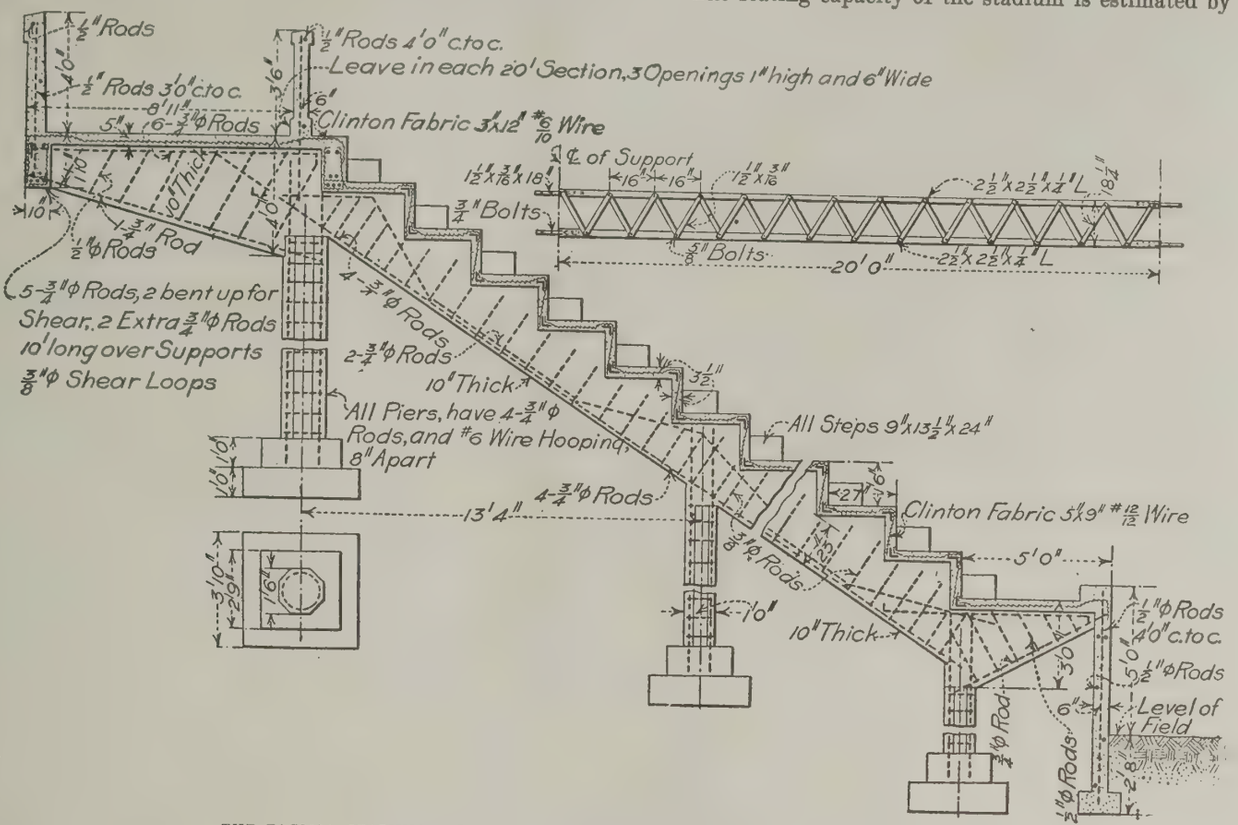
Concrete in tension, 0; concrete in shear, 50 pounds per square inch; concrete in direct compression, 400 pounds; extreme fibre stress in bending, 700 pounds; adhesion between concrete and steel, 70 pounds. Steel in tension, 16,000 pounds per square inch; steel in compression (in columns), 6,000 pounds; steel in shear, 10,000 pounds. Ratio of moduli of elasticity of steel and concrete was taken to be 15.

The columns being short, it was unnecessary to design them for fixture; and in their sign they were increased in size to better withstand any sliding tendency that might develop in the ground.

THE TACOMA STADIUM.

In calculating bending stresses, the straight-line formula was used. The girders were figured as simple beams, and maximum bending moment was taken as $W\,l/8$.

The beams under the extreme outer edge of the promenade were not figured as being continuous, but the maximum bending moment was assumed to be $W\,l/10$.



The beams forming the risers of the seats were latticed, being built of steel angles and flat bars. They were set directly on the girders and the ends bolted together over the girders by means of fish-plates. They were figured as simple beams, and sufficiently strong without the aid of enclosing concrete to bear safely the assumed load. Over the beams were laid strips of Clinton wire fabric 5-inch by 9-inch mesh 12/12 wire, the wires on the 5-inch spacing being laid normal to the beam. Where two layers of fabric joined they were securely wired together. It was at first intended to construct the beams of reinforced concrete, but it was found that by substituting beams of structural steel a comparatively large saving could be made. This was accomplished, first, by a saving

of time in erecting, and, second, by a saving of time and money in form work. The latter was accomplished by hanging the forms from the steel beams, thereby making unnecessary expensive shoring below.

In some cases, especially in massive work, expansion joints are provided from 25 feet to 50 feet apart throughout the length of the structure. In this case, however, it was considered better for two reasons to provide sufficient steel in the concrete to take up the contraction and expansion; first, because expansion joints would be almost as unsightly as cracks, and, second, because of the thin section of the concrete subjected to temperature stresses. The amount of steel required depends on the range of temperature to which the concrete is subjected, and to the position of the steel in the concrete.

The principal quantities used in the construction were approximately as follows: Excavation, 185,000 cubic yards; concrete, 10,000 cubic yards; steel, 160 tons; Clinton fabric, 130,000 square feet.

The seating capacity of the stadium is estimated by the architect to be 30,000, but by using the available standing room 35,000 people have been in the stadium at one time, and none of them on the field. It is planned, should necessity arise, to build additional seats on the terraces. In this way the seating capacity could be increased by 12,000 to 15,000. The entire cost was about $135,000.

THE TACOMA STADIUM: SECTION SHOWING REINFORCEMENT OF SUPPORTING COLUMNS.

THE COST OF HEAT

IT COSTS just as much to keep a coal fire for a family of two as it does for a family of eight, so that the coal fire is very economical in large families, and expensive in small families. About thirty years ago gas ranges were introduced to the kitchen, and since then they have held their own, more because of their cleanliness and handiness than for their real saving in expense. Several years ago it was discovered that electricity was the only form of energy that could be instantly changed into heat, with practically no loss. This led to the development of the electric cooking stove, which is so common today. Electricity is the most flexible form of heat. It can be instantly made to warm a plate, or the same pressure of the finger will let loose energy enough to boil a quart of diamonds or melt a block of solid concrete.

Electricity is about the only thing that costs less today than it has at any time since it became a recognized utilitarian force. This is owing to the astonishing improvements which have been made in electric apparatus. One dollar will now buy ten times the amount of electric light, which can be transformed into heat, than it would purchase twenty years ago. Power rates have been reduced each year, as the cost of producing electricity has diminished, and wherever electric cooking is advocated, a special rate, at about one-third the price asked for electric light, is obtainable. In a modern electric kitchen where the heat is applied direct to the devices and utensils, instead of through the medium of a wasteful stove, the current used will approximate 300 watts a meal a person. This means from $1 to $1.50 per person per month.

A good coal stove costs about $50, a gas stove about $25, and an electric kitchen outfit, $75. This seems high for the latter, but it must be remembered that the cost includes all the kitchen devices necessary for cooking the meals, such as the cereal cooker, the frying pan, the oven, broiler, percolator, grid, toaster, etc. An electric device is made to heat water to the boiling point as fast as it is drawn, the turning on and off of the water performing a like service for the electric current.

Cinder Concrete as a Fire-Proof Material

CINDER concrete has been under test at Columbia University for the last two years, to determine its qualities as a fire-proof material. The walls of the buildings used in subjecting floor constructions to fire tests have been given five fire tests of four hours each, during which the temperature has been raised as high as 1,700 degrees Fahr. At the end of each test a stream of water at 60-pound nozzle pressure was played back and forth over the ceiling for ten minutes, while the ceiling wall was red hot. After this severe treatment, Professor Ira H. Woolson states that the walls are practically as good today as they were when new, except that the rear wall has been scored by the water to a depth of from ½ to 1 inch for 2 or 3 feet near the top. He believes the structure is good for an indefinite number of tests, the only repairs necessary being an occasional plastering, to renew the wall surface washed away.

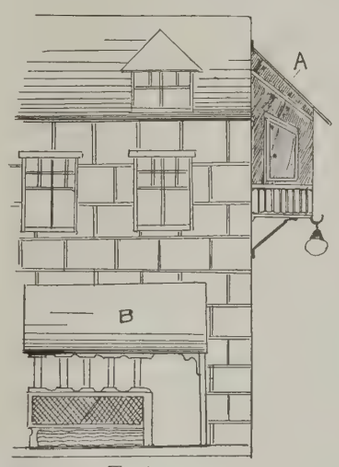
Professor Woolson believes that, within reasonable limits, the percentage of coal and the amount of fire material in cinder concrete have very little, if any, effect on its fire resisting qualities. He believes that sifting and washing the cinders would be a useless expense, and injurious to them as the aggregate for concrete. The pieces of coal which came next to the surface in the walls have been burned to an ash, but they remain in place and act as a non-conductor of heat. Plenty of particles of pure coal can be found in the walls less than 2 inches beneath the surface.

ADVENT OF THE SLEEPING PORCH

By GEORGE RICE

PERSONS believing in plenty of fresh air are ordering carpenters and builders to make sleeping or air porches on their houses. The original architectural design of quite a number of buildings in cities and towns has been altered in order to permit the addition of this porch fad. The sleeping porch in the future may be a part of the original edifice, according to statements made by some of the interested parties. One contractor and builder told the writer that he had a very large number of orders for installing sleeping porches on homes already built.

While the designer of the sleeping porch has more or less difficulty in affixing a porch to the house which is already erected, the trouble is quite easily overcome by the use of various braces and brackets with which the fastenings are made to either wooden,



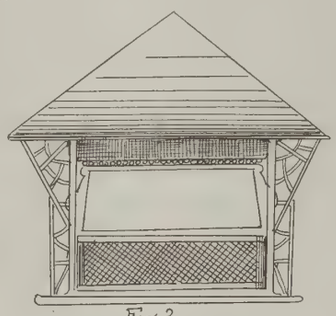


Fig 1

Fig 2

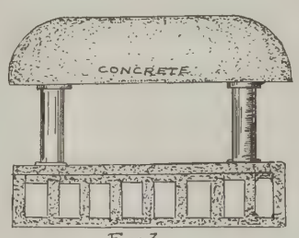

Fig 3

masonry or other kinds of walls. There have been sleeping porches attached to the hard, smooth concrete walls of buildings. Sleeping porches are often attached to bedroom windows. Some are designed to fit so securely with braces and hangers that very few screws or bolts are needed in the main building. A system of angular braces can be designed with which ample fastening can be obtained without damaging the walls of the building itself. The advantage of having the sleeping porch attached to the chamber window is that in cold weather the occupant can use the warm room for dressing and the sleeping porch to rest in. The introduction of the sleeping porch has resulted partly through the recommendation of physicians who have advised certain classes of patients to adopt the fresh air cure.

Persons troubled with various chronic ills have undertaken a cure by sleeping and sometimes reading and dining in open porches during the cold weather. Cures have been brought about.

There are ready made porches on the market to fill the demand, and some of these are of good design and useful. On the other hand, many people who want a sleeping porch prefer to get a local carpenter to design a porch and erect it according to the peculiar ideas of the patron. Sometimes they claim wooden addition to the main building is desired. Then again a very artistic and costly structure is contemplated. Then in some instances the customer desires to have the porch erected at an elevation so that an abundance of cool, breezy air may be obtained. Other patrons of the sleeping porch want to get close to the ground and use the lower story. There are porches made of wood and some of sheet metal. Concrete is finding service in the sleeping porch, too. Figure 1 illustrates two sleeping porches fixed to the building. The upper porch is marked A. It is constructed of ordinary boards, properly shaped and trimmed. Mouldings are employed to shade off the edges properly. The front side of the porch is the open side in this case. Windows with sliding sash are employed. In the event of storm these windows are closed and the porch becomes intact like the main part of the house. When the weather is clear the windows are wide open and the patient gets plenty of cold, fresh air as desired. Perhaps this is his sleeping porch, but in most cases the occupant utilized the place to read, write, smoke and rest. In fact, while he is taking the fresh air cure, he makes this place his home much of the time.

In case that the patient desires to have the sleeping porch a part of the building on the main floor, the plan shown at B in figure 1 is adopted. These porches can be erected at moderate expense, according to the market prices of labor and material. Much has to do with the selection of stock. In some instances the cheapest of material is used because it is the intention of the patient to use the porch only until he gets well. He may figure on recovering his usual state of health in six months. Hence he does not want to expend money for a porch of lasting duration. Some of the porches are exceedingly flimsy because of this fact. I have seen porches of frame work of wood with canvas covering put up at an expense of $20.00. Then again there are porches erected with mosquito screening only at even less expense. Some of the rich folks invest several hundreds of dollars in modern types of permanent sleeping porches. Such porches are really rooms with all of the lighting and modern conveniences except heating."

In figure 2 is another form of the sleeping porch, showing the front side, with lattice work liberally used. The manufacturers of concrete have not been behind hand in designing concrete porches of a nature calculated to be attached to position on a building where a foundation of suitable character can be used.

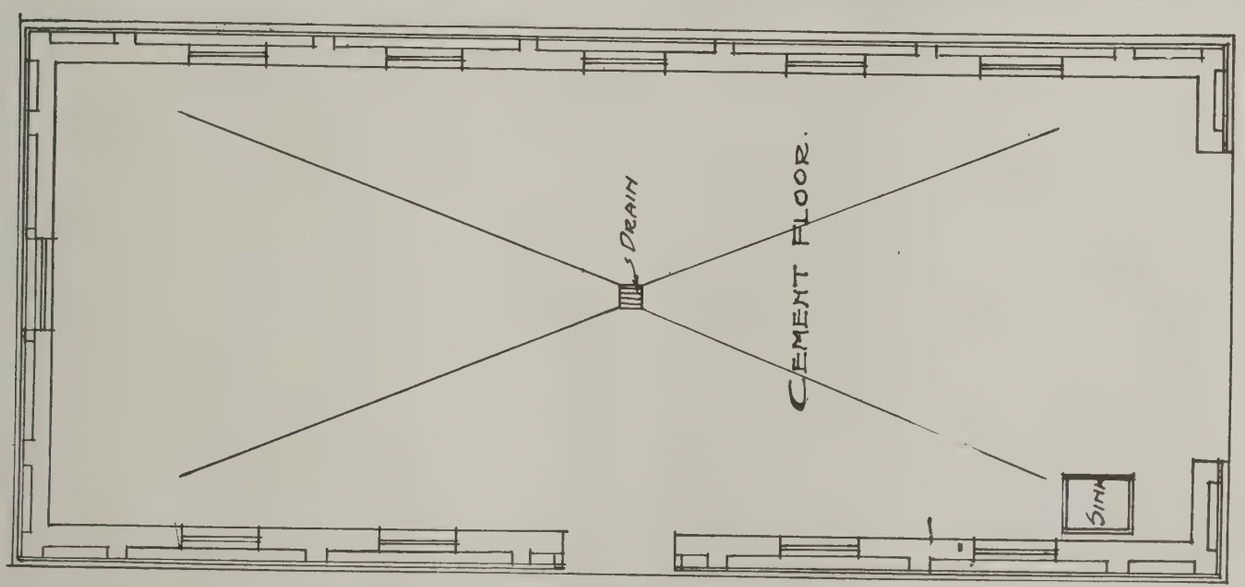
Figure 3 is a design for a concrete open porch. The porch is usually made so that plenty of wind can circulate through it. Openwork is the fad. Certain builders of my acquaintance are making good profits designing and constructing sleeping porches to comply with the modern fresh air fad.

CHIMNEY COUNSEL

TO some contractors and builders the chimney is a necessary incident that he does not figure to make anything out of and usually does not give much thought to in the way of design or location except to get it out of the way as much as possible and keep it from interfering with the general plan of the house. Moreover, even to some building owners the chimney today is merely incidental, especially where the old-fashioned fire-place is done away with and a furnace is used to heat the building. For that reason we are losing some of the old-time regard for the technical qualities involved in chimney building.

The chimney really deserves as much careful attention both in the matter of location and design as any of the balance of the house, and more in some respects. If we go about it right we can build better chimneys today than ever before, for there is better material to work with and there is a common practice of equipping chimneys with special flue lining that insures a smoother surface and better draft than the old-fashioned chimney, and also less danger of the chimney being choked by being made small at some points of its heighth and interfering with its drawing qualities.

There are several points the wide-awake builder should keep in mind about chimneys. One of these is that the best service can be secured from a chimney that is built entirely inside of a house.



It is quite a common practice these days to build a chimney on the outside for ornamental or architectural effect and it does very well, too, provided the body of the chimney is made thick enough to prevent the chilling from outside. A chimney with one side exposed or entirely exposed to the outside elements will not draw as well as a chimney all enclosed inside a building, because the cold air outside tends to cool off the chimney and cool the temperature of the gases ascending the flues and thus lessen the force of the draft. To get the maximum of draft the chimney should be enclosed somewhere in the center of the house so that the gases will retain their heat until they pass up to the top. Also, a chimney of this kind helps heat the house and where practical to include in the plans it is really best to locate the chimney all inside somewhere near the center of the building.

Another point is, urge upon customers that they have all chimneys built with fire-proof flue linings, which is made in standard sizes from 7 inches square inside to 7x11 inside, and even 11 inches square. Usually these are made so that their outsides are equal to one or two lengths of brick so that they will work in well with the brick.

There are strong points in favor of the flue lining; one is that it insures safety against fire through defective flues.

CONCRETE GARAGE FOR H. E. DAVIS, GLENRIDGE, N. J. DAVIS, MCGRATH & KIESSLING, ARCHITECTS, NEW YORK CITY.

THE DRAWING TOOLS

THE drawing tools of the old-time carpenter were a square, his two-foot rule, and a carpenter pencil or a round pencil. With these he drew plans for houses, barns, and other structures. That is, drew the general outline so that he could understand what he meant to do, but did not undertake to work from these in detail.

The modern plan of work involves quite commonly the laying out of everything in detail, drawn to scale, and the carpenter, whether he be young or old, that does not keep up with these things, learn to work from blue prints or scale drawings will soon fall behind the times and soon become a helper instead of a leader.

It is not only necessary for a carpenter to understand drawings and blue prints, but every carpenter should make it a point to equip himself with a good set of drawing tools and have a drawing table in his study at home or in his shop and put in a fair amount of time in drawing. He should draw in detail lots of work that he can easily do without the drawing simply for the sake of the training it gives him. The habit of drawing is a great aid to reading plans and taking off work from plans, and besides training in drawing is almost essential for the modern carpenter. In many instances the carpenter must be part architect and often by being something of an architect he can further his own cause by submitting plans to people who are thinking of building and altering them to suit their notions, thus giving them the advantage of architectural advice without the expense.

In short, drawing tools are today as much a part of the carpenter's equipment as his woodworking tools, and he should keep in practice and using them even though it involves drawing in detail lots of work that he might easily do without.

VALUE OF THE PRIVATE ICE HOUSE

By GEORGE E. WALSH

THE country estate and residence should depend upon its own private ice house for refrigerating purposes, and modern methods of living require that such a house should be constructed with a view to furnishing ice for the table and for chilling dairy rooms and cold storage places for fruits, eggs, butter and meat. There is a great variety of ice houses in the country, and many are built on plans of rather elaborate nature, but when the cardinal principles are thoroughly understood it will be found that any one with the slightest gift for carpentry and masonry can build or at least design and oversee the building of a perfectly adequate ice house.

The principle of ice preservation is simply that it must be protected on the top, bottom and sides from contact with the air by six to ten inches of sawdust. In proportion to the completeness of this protection will the preservation of the ice in hot weather depend. Next to hot air water is the most destructive agent to the ice. Consequently there must be perfect drainage so that the water from the melting ice can be conducted quickly and adequately away. The third point to observe is that there must be good ventilation under the roof above the ice to carry away any undue moisture that may collect. The sawdust spread over the top of the ice is to protect it from the air; the roof is merely to protect it from sun and rain. The drier the ice is kept the longer it will remain hard and perfect. There must be constant moisture ascending from the melting ice and saturated sawdust on top, and if this damp air is not removed by a good system of ventilation the ice will rot quickly.

With these principles understood it is not so difficult to design and construct a serviceable ice house for private use. We have two general types of ice houses to choose from. One is the underground or ice pit, and the other is the surface ice house. At one time the surface ice house was considered impossible. Ice could not be kept except underground, but as the principles of ice keeping were better understood it was found that the surface ice house properly constructed would answer all purposes. Most of the old ice houses were built entirely of wood, but today more are constructed of stones and cement. These grout ice houses are cheaper and fully as serviceable as any wooden affair, and they can be built with but very little expense in regions where stones are abundant.

How large an ice house does the average family require to carry them from ice season to ice season? A good deal of estimating has been made on this problem, and the consensus of opinion is that a house 8 by 8 feet, inside measurement, and walls 8 feet high, will hold all the ice that the ordinary family will need, provided the house is constructed so the ice will keep well and reasonable care is exercised in keeping it protected with sawdust at all times. For a family where ice is needed for cooling the milk of a fair sized dairy, a house 12 by 14 feet should hold sufficient to carry from season to season. An ice house for a private family, boarding house and dairy should be at least 14 by 16 feet and 14 feet high.

An ice house of the latter dimensions, except that the height varied from 18 feet in the rear and sloped to 10 feet in front, was built for about $150. The foundation walls are of loose stones laid on the surface in the ordinary method for building barn foundations, and coarse stones and gravel are spread and leveled over the ground within the foundations to a depth of about six inches. Eight-inch chestnut sills are laid on the foundation walls, and on these are erected 2-inch by 6-inch by 14-inch studding with 2-foot centers. The corner posts are made of two 2 by 6 joists nailed together, and the posts and studding are nailed to the sills and not framed. The framework of the walls are completed by a 4 by 6-inch plate, and the rafters which support the roof boards and shingles are 2 by 4-inch joist, with 3-foot centers. The walls are lined with unmatched hemlock boards, and the outside covered with novelty siding. At the top a space of about three inches is left open to ventilate, and also a space between rafters and the plate is left open. Doors or windows in the gable ends give a good circulation of air. The foundations are banked on either side to prevent the air from reaching underneath.

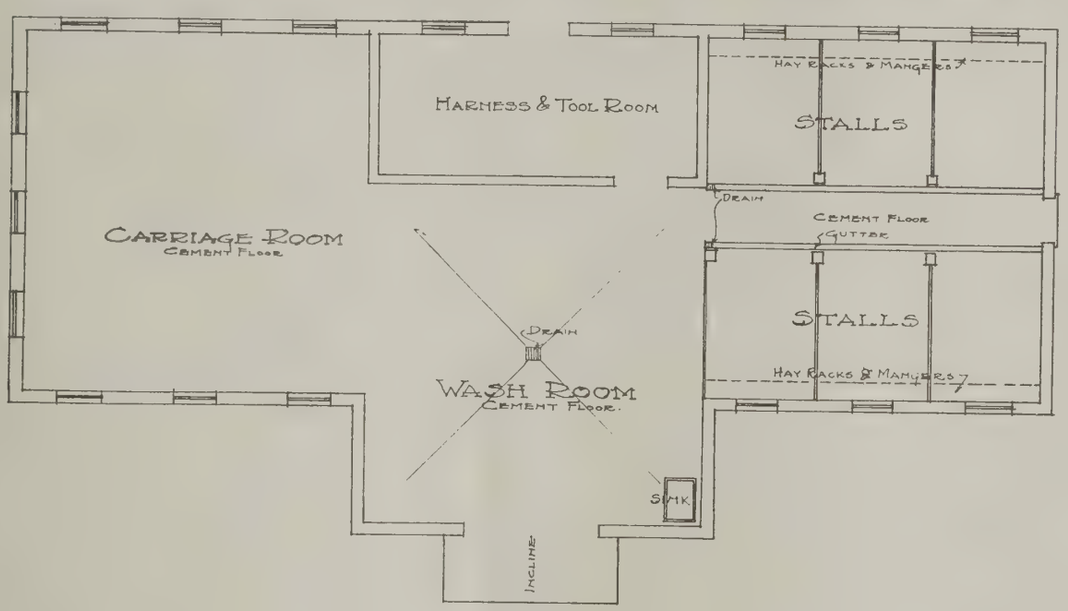
The grout or cement ice house should cost less than the above. If properly constructed the cost should not exceed $100 to $125 for a house of similar capacity. Only field stones and cement are used in this type of house, except the wood in the doors and roof. The walls should be about 12 inches thick, and are made of stone bound together by a mixture of sand and cement. In order to make this type of house false work must first be constructed, consisting of a double row of posts along the line of the foundation with boards placed between, one high, and removed as the courses are laid and set. The boards must be kept at a regular distance apart, so that the walls will be of uniform thickness. Between these boards stones of various sizes are placed, and then bonded together with concrete. The mixture of sand and cement should be fluid enough to run in between the stones and form a compact mass. The walls are built up in this way, one course on top of another, and the boards finally removed when the coment has firmly set. A plate is then laid on the walls, and the roof erected in the ordinary way. Frames for doors or windows are made before the walls are erected, and the grout work settles firmly around them. The boards used for the framework of the foundations can be used for the roof. An ice house of this character, measuring 12 by 14 by 8 feet has been constructed for a trifle over $90. The highest single item in the cost even then was for lumber used for the cribbing and roof. The three next highest cost of items were for labor, cement and for hauling stones.

All-concrete icehouses are also popular, and their cost reasonable. The method to pursue in such cases is to excavate a foot below the desired depth, and lay down coarse gravel or broken stone, and when rammed down hard this forms a good floor with plenty of drainage. Set up the forms as desired, allowing 16 inches for the walls. Build foundations sixteen inches wide and four feet deep, or below the frost line. Then build two 3-inch walls, with a 10-inch space, each reinforced with one-quarter inch rods placed 12 inches apart in both directions. The walls are built in sections of about two feet at a time. The outer and inner walls are bound together by galvanized iron strips at every coarse. These strips strengthen the walls. The roof is made slanting and double, like the rest of the house.

The mistake is commonly made of placing the icehouse a considerable distance from the residence. Usually it is near the pond where the ice is gathered. There seems to be a mistaken notion that time and labor are gained by filling the icehouse near the pond, and then carting the ice piecemeal to the residence as needed. Just the opposite is the truth. Ice once loaded on wagons can be carted in bulk cheaper than it can be carried by small pieces.

There is no unsanitary conditions about an icehouse. If there were the ice could not keep well. Therefore it can be located near the residence, preferably in back near the kitchen where the supply can be obtained easily and quickly. If properly built it will not spoil the architectural effect of the landscape. If there is danger of this the ice pit can be placed entirely underground, and nothing shows above except a slight roof a few inches above the ground. The ice in such pits is difficult to get at, for it must be reached by a ladder and each piece must be hauled up by hand or by tackle.

Ice can usually be purchased in the winter season from neighboring ponds when the crop is good from one to two cents a cake. A good many make a business of cutting and selling ice to those owning houses. The cost of purchasing ice and hauling and storing amounts as a rule to about 50 cents to $1 per ton. Even so it pays a big dividend to own your own icehouse. But a better way is to have your own pond.



Now there are many natural depressions, where, for a small outlay, one can make an artificial pond for ice cutting purposes. By building a slight dam across the narrowest point the water can be backed up to a depth of a couple of feet. Such a shallow pond freezes much quicker than deeper ones, and if fed by bottom springs the water will be pure enough for all purposes. A sluiceway should be provided so the water will be kept moving.

A space of eight to ten inches is left between the pile of ice and the walls, and this is filled in with sawdust. Pack and ram this sawdust down well, especially near the bottom. So much depends upon the packing that this point cannot be over-emphasized. Boards must be placed across the doorways or windows to keep the sawdust down in position. When the house is filled with ice to the desired depth ten inches of sawdust should be placed over the top. Then if the ventilation and drainage are good the ice should keep well.

The icehouse in warm weather should not be opened every day, for each time the warm outside air melts a good deal of ice.

CONCRETE STABLE FOR J. J. CHAPMAN, BARRYTOWN-ON-HUDSON, N. Y. CHARLES A. PLATT, ARCHITECT, NEW YORK CITY.

PLAN OF STABLE.

Coating Tin Roofs with Coal Tar

The question was recently raised by a Kansas correspondent of the *Painter's Magazine* as to what would be the best treatment for a tin roof that had been coated for some time with coal tar. He stated that the tar could not be removed because its removal would open up leaks where the tin had rusted badly. Oil paint was tried, but it did not adhere to the tar. In some places the tar was ⅛ inch thick, and in other places the tin was bare. The tar on drying crawled in bunches, and on hot days the sun softened the tar.

The journal in question replied as follows: The best remedy would be a new roof, and if the roof is a flat one, a gravel and tar on top of this without removing the tin would be best. However, if the roof is gabled in, if gravel roofs are not used in that locality or if the owner does not want to go to the expense of a new roof, the very best thing to do is to wait until the tar becomes hard and then go over the roof with a stiff broom, removing whatever loose dried-up tar may be there. Then coat the bare spots on the roof with liquid coal tar, to every gallon of which add ¼ lb. air slaked lime (quicklime that has been permitted to fall into powder by exposure to air and is then sifted), and 2 ounces of dry soda ash or pearlash. Stir thoroughly, and if the coal tar is too heavy, then with coal tar naphtha or turpentine. Do not use benzine or gasoline for thinning, as that makes it too brittle. Instead of one heavy coat, apply two thick coats. If some of this gets on the old tar it does not matter, as you can hardly spoil the appearance of the roof now.

ADVICE TO ASPIRING CONTRACTORS—Second Paper

By CHAS. ANDERSON

THAT knowledge is power is undeniable. As generations pass, our wealth of knowledge in all the sciences, arts, professions and mechanical pursuits increases. Which means (be it right or wrong), the survival of the fittest. We find in every branch of human activity those in competition straining every nerve to outdo the other.

It is true, in some branches, large syndicates and monopolies are formed with the purpose of removing this competition. While in other lines competition becomes keener every day, contracting, it can safely be said, is one of these lines.

To enter such a race with any hope of winning one must be thoroughly prepared. I do not mean to say prepared with an abundant capital, but with a technical and business training.

While a course of study is very essential, it is generally conceded that theory alone does not fit one for practical business; practice must accompany or follow the study of theory.

One might master all the text-books obtainable and yet be unprepared to successfully combat his competitors in actual business life.

At least two years should be spent associated with some prosperous contractor or firm, strict attention being paid to the minutest details of the business. Thorough knowledge is more necessary than capital. Some of the most successful contractors have begun with a very small amount of capital.

OTHER ESSENTIAL ELEMENTS.

First. Honesty: Be honest, because it is right; dishonesty breeds contempt, ruins credit, and destroys the brightest prospects. Better remain poor, than become rich through unfaithfulness and deception. The man who rises through dishonesty and trickery will sooner or later come to grief.

Truth crushed to earth will rise again and live; the eternal years of God are hers.—POPE.

Second. Diligence: Idleness is the curse of mankind. Take care of the minutes; the hours will take care of themselves. God deems time so precious, He only gives us one moment at a time; each one lost is lost forever; it can never be recalled.

Third. Perseverance: Do not allow yourself to become discouraged. You notice that those who have accomplished the best results have been noted for their perseverance. Sticktoitivness; this consists as much in waiting as in working. Work diligently and wait patiently for the results.

Fourth. Politeness: Genuine politeness is one of the business man's best assets. It is a great power in controlling men and circumstances. It often succeeds when all else fails. It is said it offered people more pleasure when the Duke of Marlborough denied them a request than when others granted it: because he did it so politely. A friendly word usually finds a friendly heart; politeness cost nothing, but it makes its possessor rich.

SAFE BUSINESS RULES AND PRINCIPLES.

Business men in business hours attend only to business matters.

No man will be successful who neglects his business.

A man of honor respects his word as he does his bond.

Make your business known in few words without loss of time.

Cut short your losses; let your profit go on.

Know the exact condition of your affairs by keeping accurate accounts.

Settle often; have short accounts.

Become known and favorably known.

Let your dealings with a stranger be most carefully considered.

Choose that investment which will best promote your regular business.

Leave nothing undone that ought to be done.

Follow your business closely and it will lead you to honor and wealth.

Be clear and precise in all your bargains.

Trust nothing to memory that should be in writing.

Make no haste to be rich if you would prosper.

Be economical, industrious and self reliant.

Ever live (misfortune excepted), within your income.

Do not take too much advice, think for yourself.

Be courteous to all with whom you come in contact; courtesy may lead to a fortune in itself.

Avoid speculations; concentrate your energy and means on your business.

Treat all men with respect; confide in few; wrong no man.

Keep your word as good as a bank; remember that an honest man is the noblest work of God.

Be economical. A gain usually requires expense, what is saved is clear.

Be well satsified before you give credit that those you give it to are worthy to be trusted.

THINGS TO AVOID.

Never sign a paper for a stranger.

Never take chances on another man's game.

Never fail to read a paper carefully before signing your name to it.

Never fail to keep a business engagement.

Never boast about your business.

Never advertise your competitor by running him down.

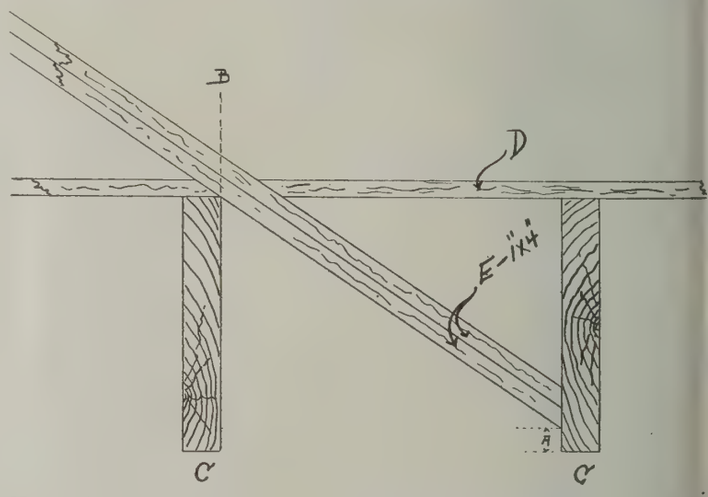
Never neglect to perform the commission which your friend may have entrusted to you.

Never borrow money and neglect to pay it back; if you do you will soon be known as a person of no business integrity.

Never unduly infringe on another's time. Bear in mind time is valuable.

Never disappoint an old customer to oblige a new one.

Never forget that it is written: those that are faithful over a few things may be ruler over many.



Never fail to speak kindly when addressing those about you. show yourself to be a gentleman by your pleasant mode of address.

In my next paper I will give a few hints on bookkeeping, suitable for the beginner.

ONE WAY OF CUTTING BRIDGING

By W. A. LANE

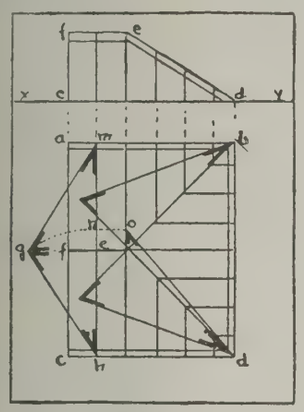
OFTEN contractors object to a man taking the time to use a strip to space his floor joist or to let him cut a lot of bridging in a mitre box before starting to lay the flooring. They prefer laying the floor up to the center of the room then from the pile of scrap 1 by 4-inch sheeting proceed to cut the bridging as follows: C C is an end view of the floor joist. D is the flooring.

Now with two pieces of 1 by 4-inch laying flat together as at E and one end about an inch up from the bottom edge of the joist as at A, and the other end resting on the top edge of the next joist, holding them in this position with one hand, saw down and across on the dotted line B. These two make a pair of bridging for that space. Do the same for the next ones. This method is quick and makes a good fit, no matter how wide or narrow the spaces are, you are always certain of success.

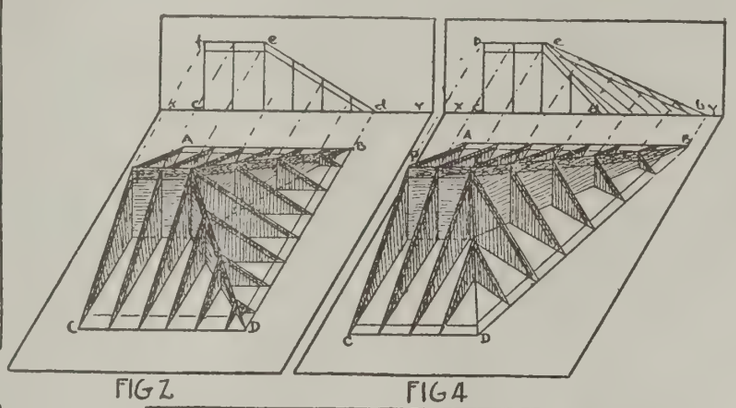
The Parson—And so, Donald, it's been touch and go with you this time. Ten stories is a long way to fall. I suppose thoughts of your past life passed hurriedly through your mind?

Donald (the local window cleaner)—Well, sir, I was a bit worried till I got the length o' the fifth story, and then I minded that I'd left my pipe on the window sill. It was a weight off my mind, sir.—M. A. P.

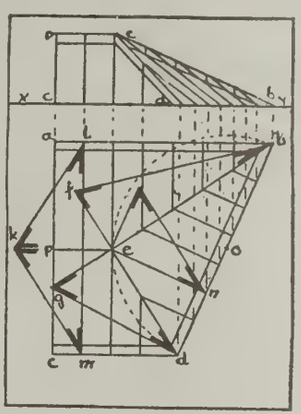
ROOF CONSTRUCTION WITH PAPER MODELS



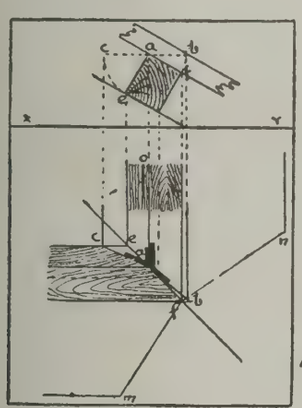
By JOHN Y. DUNLOP



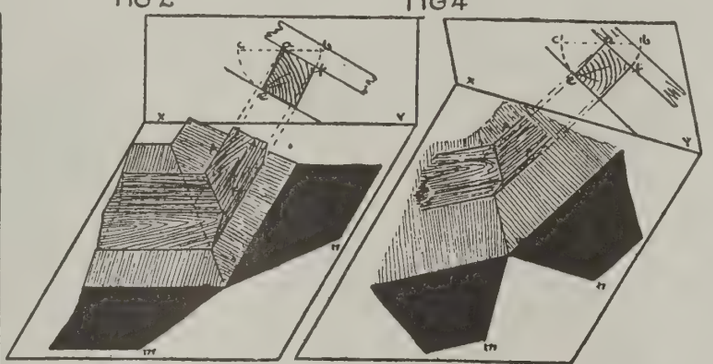
IN the most simple form the hip roof is a quadrilateral pyramid, each triangle side of which is a hip, and the rafter in each angle is a hip rafter.



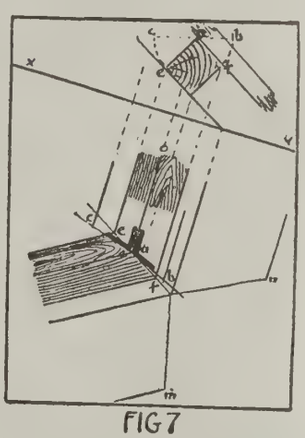
The common rafters which lie between the hip rafter in the plane of the sides and ends of the roof, and which, by abutting on the hip rafters, are necessarily shorter than the length of the sloping sides, are called jack rafters.



The various points to be determined in a hip roof are as follows:



The angle which the common rafter makes with the plane of the wall-head; that is the angle of the slope of the side of the roof or the level bevel.



ROOF CONSTRUCTION, ILLUSTRATED WITH PAPER MODELS—BY JOHN Y. DUNLOP.

The angle which the hip rafter makes with the wall-head or the bottom bevel.

The angle which the hip rafter makes with the ridge piece, called the side bevel.

The height of the ridge, the length of the common spars, and the jack rafters.

The length of the hip rafters.

Fig. 1 shows the plan and elevation of the end of a roof, the pitch being given to find the true length of the rafter and the side bevels of the jack rafters. A, b, c, d is the plan of the roof; draw e f parallel to the side and in the middle of the distance between them. Set up the height of the ridge, and draw the slope of the common rafter on each side. This will show at a glance the lengths of the common rafter, and its inclination to the horizontal and vertical indicates the two bevels.

It will be seen that those two angles which are the horizontal and the vertical bevel are always equal to a right angle, the edge of a common rafter being the hypotenuse of a right angled triangle.

If the lower end of the common rafter is a projecting rafter, then the end of the rafter will require to be cut to the angles shown to enable the fascia board or gutter facing to be fixed against it.

It is plain that with ridge roofs all common rafters will be the same length when the side walls are the same height and parallel to each other, and the ridge is parallel to the walls.

In all other cases the rafters will vary, and the length of the rafter can only be obtained by drawing a cross section through the roof, or as it is done in practice by setting up the two end spars and measuring the length of the intermediate spars with a rod.

To determine the length and bevel of the hip rafters: If the pitch of the sides and end of the roof is the same, and if the end wall is at right angles to the side, then the plan of the hip rafters bisects the angles of the building, and the two hip rafters are the same length, as shown in the plan Fig. 1.

To obtain the length of the hip rafters, consider the plan of the rafter as the base of a right angled triangle, the hypotenuse, which is the true length, while the altitude is the height of the ridge above the wall plate.

In Fig. 1 the length of both rafters, with the top and bottom bevel, is shown.

The top and bottom bevel of the jack rafters are similar to those of the common rafters, and if the hip rafter against which they are fixed bisects the angle of the building, then the jack rafter on each side are similar.

Turn h g on to m n, and draw m o parallel to the sides of the roof; draw o d, and the edge cut or side bevel is shown at o. It will be seen that to obtain the edge cut, the surface h g developed is the actual roof surface turned horizontally, the end bevel of the roof boarding being o d h.

Fig. 2 shows the paper model of this example, which should be made up in such a way that it can be folded flat for reference.

Fig. 3 shows an example similiar to Fig. 1, excepting that the angle which the end of the roof makes with the side is not a right angle.

Bisect d b in o, and from o describe a semi-circle; draw e k parallel to the sides and join e d and e b for the plan of the hip rafters.

On m l set of the slope of the sides of the roof, which will give the point k the height of the ridge. Draw e g and e f at right angles to e d and e b and from e set off g and f equal to the height of the ridge. Join g d and f b which shows the true length and the bevels of the hip rafters.

Fig. 4 shows the model which should be cut out of separate pieces of paper and set up as shown. By it I hope that the apprentice will be able to understand clearly the various cuts in hipped roof construction.

Fig. 5 shows how to obtain the bevels of purlins meeting on angle couples.

Purlins, which are generally horizontal, require cutting where they meet or where they are required to be fitted against hip rafters.

When the purlin has one of its faces in the plane of the roof the end cut presents some difficulty.

Fig. 5 shows how those bevels are obtained.

The plan and elevation of the purlin at the corner of the roof should first be drawn. From a as center describe the arcs a c and a b and from the opposite extremities of the diameter draw c c and d d perpendicular to x y. From e and f corners of the purlin draw e e and f f parallel to c c; also from e and f draw e c and f b parallel to x y; join b a and a c and the angle o a c is the down bevel of the purlin and o a b the upper edge.

The method shown is on the principle of developing or turning the width as seen in the plan until they are horizontal, then projecting them to the plan and carrying the points forward to the projected lines. By following this method it is possible to obtain the end bevel of purlins in special cases (Fig. 7) without confusion, even with roofs having the sides sloping at different angles.

In all cases a section of the common spar and purlin should be drawn in position, x y being always drawn at right angles to the length of purlin in section.

Fig. 6 and 8 show models of both examples, the sloping surface on which the purlins are lying being cut out of the drawing. The model of the purlin is made of separate pieces cut to the angles obtained in Figs. 5 and 7 and gummed in position as shown. —*From English Carpenter and Builder.*

PAINTING AND DECORATING A RESIDENCE

THE painting and decorating of a residence is an important subject to the contractor and owner, because it entails the outlay of a considerable amount of money, and being the part of the house, i. e., walls, woodwork and floor that receive the greatest wear, it is necessary that the builder should use careful judgment in his selection.

THE NATIONAL BUILDER has for some time been investigating wall finishes and it is upon this part of the residence decorating this article will deal.

Kalsomine, paint and wall paper are the three materials most universally used on the walls of residences. Of the latter we will say little, as everyone is familiar with the decorating value of wall paper. However, it must be remembered that wall paper is considered less sanitary than either of the others, and if paper of any quality at all it used it is considerably more expensive. It has only been within the last year or two that the flat finish wall paint has been developed. At present it is perhaps the most popular wall finish on the market, and I might say deservingly so. Besides the great advantage of washing the walls with soap and water when they become soiled, as is possible when finished with wall paint, it has the additional advantage of running uniform in tints and flat in finish. Although kalsomine freshly applied looks like flat finish wall paint, it does not continue so but a short time.

First, let us consider kalsomining, what it is made of and how best to apply the same.

Kalsomine is made of whiting (which is ground chalk), fish glue, ground colors and water, and this undoubtedly is the cheapest material for decorative purposes.

An important factor in the success of a well decorated wall is the preparation of the surface, and if this is neglected an unsatisfactory job is the result. All cracks and holes should be made smooth and level. Whether paint or kalsomine is used, a smooth, even surface must be obtained first.

Before the kalsomine is applied to a wall which has never before been decorated, the wall should first be treated to a varnish size; this gives a hard, even surface, to which the kalsomine will adhere. Some decorators, especially where the kind of size is not designated, use a glue instead of a varnish size, principally because the glue is the cheapest.

When kalsomine is applied to a glue size, the moisture in the kalsomine has a tendency to soften the glue and is likely to cause the kalsomine to become too hard, so that it has a tendency to flake off, whereas varnish size being impervious to moisture, the kalsomine has no effect on it; moreover, it is easy to wash kalsomine off a varnish size without injuring the size.

The principal cause of poor kalsomine work is the result of the decorator using either too much or too little glue. If not enough glue is used, the kalsomine will be soft and easily rubbed off; if too much glue is put in, the kalsomine will be too hard and will flake off, and the builder must be governed by the condition of the walls to be tinted as to the amount of glue to use. One of the great objections to kalsomine is that it is practically impossible to match kalsomine; that is, if there is a spot on a wall that you wish to retouch, you cannot mix just the exact color you want, and a wall always shows where it has been retouched.

After a wall has been kalsomined twice, and a new coat is needed, the old kalsomine should be thoroughly washed off, because the third coat will seldom adhere properly to the second coat and one can never be sure of the result. Many people will kalsomine a wall three or four times, with more or less success, but I do not think this is advisable.

Kalsomining varies in cost according to the color used. For instance, a light cream will cost about four cents per square yard, whereas a dark red or green will cost in the neighborhood of ten cents per square yard.

The records we have gathered show that it has cost about $5 per room to put on a fresh coat of kalsomine, an average of $8.33 per room to wash off old kalsomine and put on a new coat, and about $10 per room to varnish, size and kalsomine. These figures include labor and material.

How long the kalsomine will remain in good condition depends on the amount of soot and dust which gets into the room. The rooms which are exposed to the prevailing winds look dingy in a year, whereas those facing a court and protected look well for two years. The first place to become soiled is over the radiators or furnace, and although some people claim they can clean kalsomine, yet my experience shows that it cannot be done successfully.

Next let us consider the use of paint instead of kalsomine, and in treating this subject I will not deal with the best methods to be employed in mixing the materials, because it is a subject which can only be handled intelligently by an expert who is a practical painter as well as having a thorough knowledge of the material to be used.

As a rule, three coats of paint are sufficient to properly cover a wall. Oftentimes the wall is in such condition that four coats are necessary to make a good job.

In mixing the paint for the first coat as much boiled linseed oil should be used as the wall will permit; then the second coat should contain a less quantity of oil. After these two coats have thoroughly dried, a coat of glue size should be put on in order to give a smooth and hard surface on which to apply the last coat.

In mixing the material for this last coat you should use about one-quarter to one-third as much zinc as you do lead. This makes a hard surface.

Three-coat paint work costs about 21 or 22 cents per square yard, whether done by contract or by the day, but personally I prefer to have the work done by the day and buy my own materials, for then I know the quality of oil, lead, zinc, etc., whereas a painter doing work under contract will invariably use materials of inferior quality.

In order to ascertain the exact cost of painting and decorating, two rooms, each 12x15 were selected.

These rooms had previously been kalsomined and the following statement shows just what it costs to wash off the old kalsomine, patch the walls, paint the walls, cost of paint and tinting the ceiling.

Two painters were employed at $3.50 per day and the best of materials used.

Washing off old kalsomine and patching walls	$ 7.45
Painting walls	6.06
Washing ceilings and tinting same	5.24
Cost of paint	10.83
Total	$29.70

If kalsomine had been used instead of paint, these rooms would have cost about $18, or about two-thirds as much as paint.

Walls properly painted and washed every few months will look well for years and a new coat of paint costs no more than

it does to wash off old kalsomine and put on new, so it will be seen that paint work is more economical in the end.

The ease with which flat finish wall paint can be cleaned, the beautiful flat effects obtainable and its durability makes it an ideal finish for walls.

A good wall finish will remain in excellent condition for four or five years, and in comparing it with kalsomine finish during that length of time, the paint is actually less expensive than the kalsomine because of the fact of the necessity of renewing the latter every year.

The flat finish paint appeals to housewives not only on account of the ease in cleaning, but it eliminates the dreadful tearing up every year to redecorate.

In conclusion, it may be safely said that flat finish wall paint is here to stay and it is only a question of time when we believe it will supercede kalsomine practically in every home.

THE BERTRAM

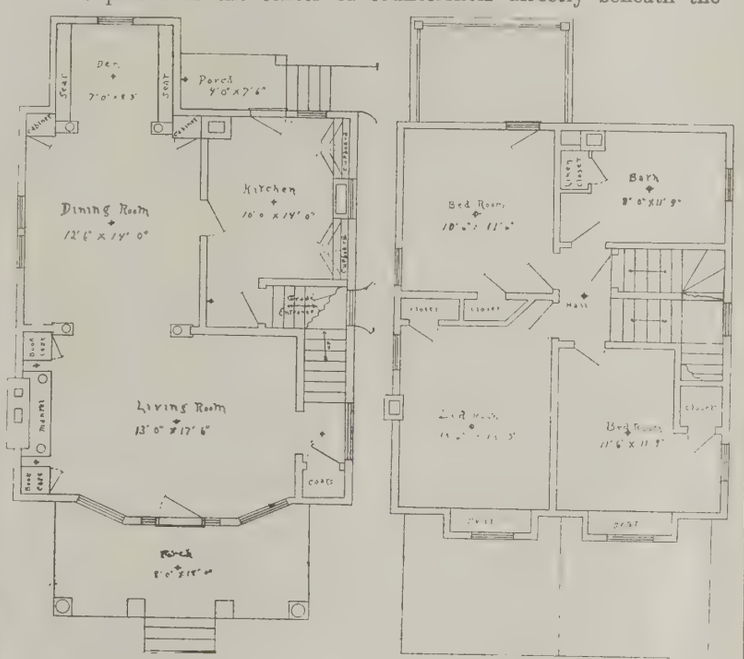
THIS house, by James Dunn, is built at Cleveland, Ohio, and has a number of good ideas in house building. The veranda has a spacious and pleasing appearance. Its features are:

(1st) The ceiling, which is of Georgia pine, polished and oiled.

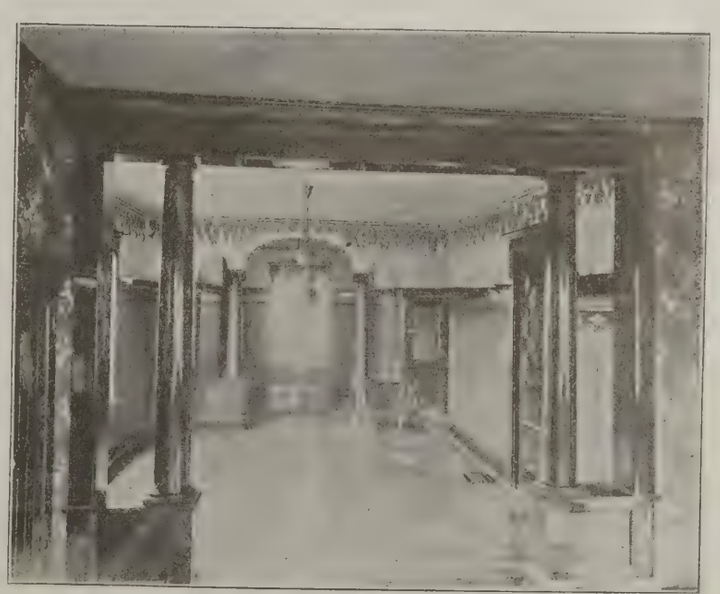
(2d) The "doing away" with a friese, the ceiling rests on the top of posts.

(3d) The barge boards, of unique design conforming with those of the main roof. These barge boards are the oirginal ideas of the builder.

The roofs are slate. The gables are shingled with red cedar shingles dipped in green creosote stain. The house is painted pure white. The chimney is a pleasing feature, being built of dark red pressed brick laid in black mortar and ornamented with cut blocks of white sandstone. The cellar walls and veranda buttments are of concrete blocks which have a white finish and are laid in black mortar. The walks are all of concrete.



The woodwork in the living room, dining room, den and stairway is oak polished and finished natural. The floors are all oak polished and waxed. The features of the living room are the fireplace of imported gray brick. The book cases with leaded glass



doors. The unique opening to the stairway, the front door, which is of the design known as the "Dutch Door." It is placed in the center of a bay as shown by floor plan, and the beautifully trimmed opening to the dining room. Here a beaded moulding is used in the construction of the head casing. This moulding is a pleasing change from the egg and dart pattern so commonly used. It is of a design after the builders' own ideas.

The dining room is of nice size, well lighted by two large windows. It has a beautiful oak plate rail. The walls are papered in panel effect to the height of plate rail. The ceiling and walls above the plate rail are finished in pure white plaster of paris and a frescoe is painted on the walls in natural oil colors by hand. There is a beautiful triple arched opening between dining room and den. On each side of this arch on the dining room side are china cabinets with leaded glass doors, while on the den side are two long seats. The den also has a plate rail and the decorations are the same as in the dining room, excepting the fresco, which is of different design. The electroliers are of pleasing design.

The kitchen has a large cupboard the full length of the room. There are four large doors beneath the counter shelf. On one of these is attached a good sized flour bin. Above the counter shelf are cupboards, one on each side of window, each having four adjustable shelves, enclosed by two large glass doors, also two large drawers. The sink is a two-piece white enameled, cast iron one and is placed in the center of countershelf directly beneath the

window. The plumbing is open and here the wall is of white tile; the walls are covered with a washable paper of tile design. There is a back entrance and porch, also grade entrance. The woodwork is of Georgia pine, natural finish, while the floor is oak polished and waxed.

The door to coat closet at foot of stairs is a one-panel door and has a bevel plate mirror panel.

On the second floor are three nice bedrooms. Each has a clothes closet. Both front rooms have a fine window seat with

tufted cushions. These rooms are covered with a paper of a very light color and small neat pattern.

The rear bedroom has a large figured paper. The window at rear is hinged and serves as a door to roof over den. There is plenty of room on this roof for an out-door sleeping room, which could either be built in or made to put away in the winter by using frames covered with netting that can be hooked together. The roof could be of canvas or tin.

The bathroom is of good size and the linen closet is placed in it. The walls and ceiling are covered with a washable paper in tile design. The fixtures are of white porcelain ware, and consists of bath tub, water closet and lavatory.

The wood work on this floor is all of Georgia pine, white enameled. The floors are all of oak polished and waxed. There is a stairway to the attic.

Every room has electric lights. The heating is hot air system.

The house is 24'0"x28'0". The den is added to the rear and is 6'6"x9'6" outside.

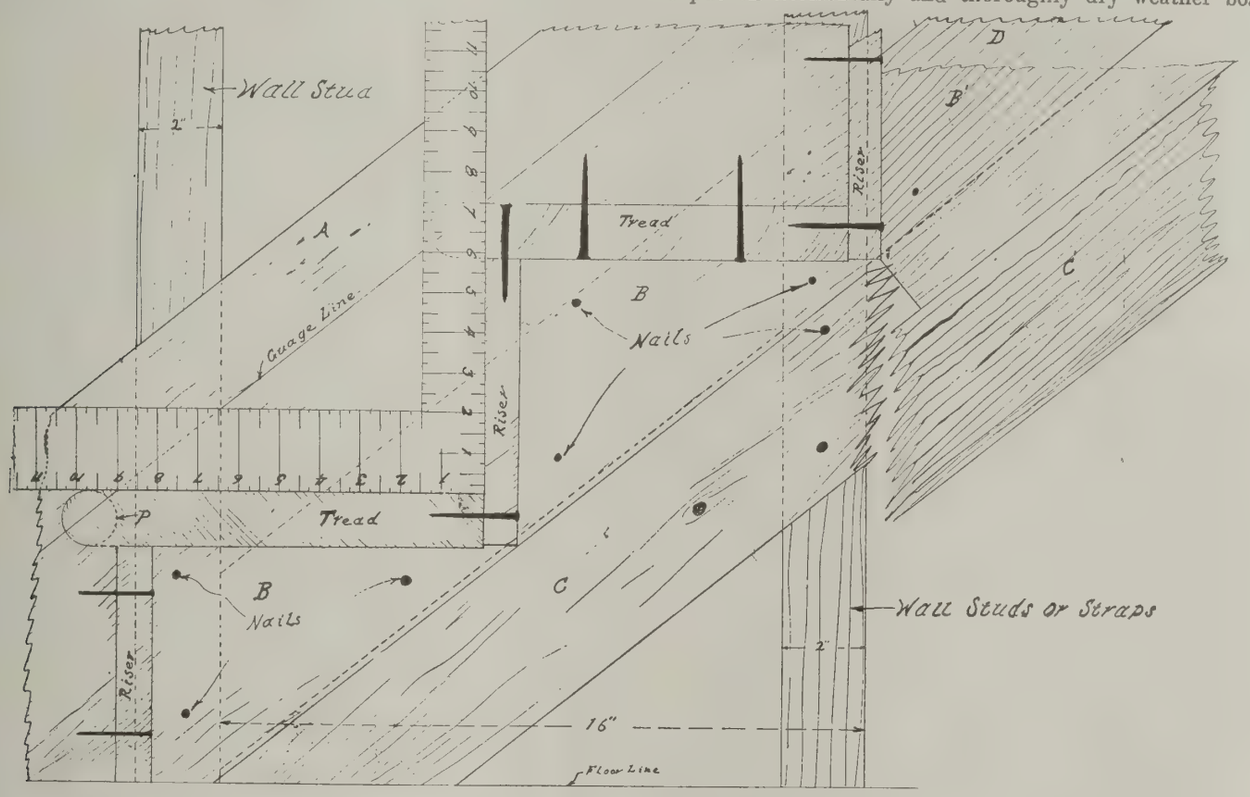
It was designed by Mr. M. E. Bertram, contractor and builder, Cleveland, Ohio. The plans show many original and unique ideas and the photos show how successfully they were carried out and the good workmanship employed.

The cost was about $2,800, divided as follows:

ESTIMATE OF "THE BERTRAM."

	Cost.	Total Cost.
Excavating 160 yards @ 35c	$	56.00
Foundation included in masonry		
Masonry		295.00
Cellar drain included in excavating		
Cementing cellar included in masonry		
Lumber		510.00
Special interior woodwork	$ 40.00	
Kitchen cupboard	32.00	
Interior finish	105.00	
		177.00
Porch work	28.00	
Doors and windows and frames	140.00	
		168.00
Carpenter labor @ 45c per hour		450.00
Hardware		42.00
Plastering 700 yards @ 26c		182.00
Keen cement included in masonry		
Painting		125.00
Finishing floors		22.00
Furnace (hot air)		85.00
Plumbing		215.00
Slate roofing		95.00
Tin work		35.00
Electric fixtures		40.00
Wiring		35.00
Mantels		40.00
Shades		15.00
Decorating		80.00
Sidewalks included in masonry		
Miscellaneous, 5 per cent		133.60
Total		$2,805.60

"The Lowest or Any Tender Not Necessarily Accepted"



THIS is one form of a formula used in connection with most enquiries for tenders. Its object is obviously to preserve, up to the actual signing of contract, the freedom of action of the parties who invite tenders. If we remember rightly, its omission on one occasion led to litigation, with the result that the court ruled that those who had invited the tenders without this qualification were under obligation to accept and carry out the lowest. This is only the correlative to the fact that a tender sent in without qualification of a relatively similar kind becomes by mere acceptance a binding contract. Hence the practice of adding to the form of tender a proviso that mere acceptance shall not constitute a contract. Contractors, however, often express themselves strongly as to the way in which the freedom thus reserved is used. When tenders are invited from selected contractors, the object is, ostensibly at least, to obtain the lowest bid for the work; and the reasonable inference and expectation is, that the lowest tender will be accepted if the work is gone on with. Therefore those who tender exercise their utmost ingenuity in order to arrive at prices which will bring out the lowest tender; in the process much time is spent and much experience brought to bear. It is, and must be, very galling therefore to such to find, as sometimes happens even to firms of high repute, that although they have come out lowest in the competition, a tender at a higher rate has been preferred. Under these circumstances contractors naturally infer that either the architect or engineer has advised his clients that the work cannot be properly done below a certain figure; or that the firm quoting the lowest price is objectionable or incompetent in some way or financially inadequate to the work; or that the job was intended from the first to go to a certain firm, and the tenders of others were invited merely as a check. Probably the last-named inference is the one most generally made, and is the one which excites anger. It will be at once admitted that a client is well within his rights in rejecting a tender which his professional adviser says is too low; indeed, a contractor is thereby saved from the consequences of his own error of judgment. Financial inadequacy or incompetence on the part of a contractor are generally sound reasons for rejections. Contractors, however, rightly think that the two latter matters should be considered beforehand, and that the mere fact that they have been asked to tender implies that they are deemed competent both financially and otherwise, and therefore that the lowest tender of those invited should be invariably accepted, unless the professional adviser is clear that the price quoted is too low. There can, of course, be no two opinions about the unfairness of inviting tenders from a number of firms merely as a check price on some favored firm, to whom the work is to be given if their price is anywhere near the mark. If the fact becomes known, and it often does, that a certain firm is to be preferred, the competition tends to become a farce played at the expense of its promoters. The better way is to accept the verdict of a competent surveyor on prices quoted by a preferred firm by way of testing their fairness. Some rather startling figures were recently given by a correspondent as to the expense of architectural competitions, and these could be easily paralleled by builders who compete freely for work. In view of these considerations it has been suggested that the formula "the lowest or any tender not necessarily accepted," or, as it is oftener put, "the proprietor does not bind himself to accept the lowest or any tender," should have the words, "the lowest or" omitted when the tenders are to be invited from selected contractors, the object being to secure an implied right to acceptance by the firm quoting the lowest price. This would make it difficult, however, for an architect or engineer to exercise his discretion in advising his client as to whether the lowest price was an adequate price, which is a serious objection. The words "does not bind himself to accept the lowest or any tender" seem to imply that lowness of price is not to be the determining factor, but that consideration will be given to the adequacy of the price quoted for the result expected. If all tenders were loyally settled on such a principle, there would be scant grounds for objection. The difficulty is that there is no criterion by which either side can test a decision before the event. It has been suggested that a fair price would automatically result from accepting, not the lowest tender, but the tender which approximated most nearly, on the lower side, to the mean price of the various tenders received. If announced in conditions of tendering, this method would probably eliminate most of the objections to the present system, and tend to make contractors quote a carefully considered price, because the temptation to resort to price cutting would no longer be the dominating factor, as it is now, and this offers perhaps the best solution of the difficulty in the case of a selected competition. When we turn to open tendering, each of the considerations to which we have referred has to be reckoned with after the tenders are in, and it becomes necessary that the advice of the professional advisers engaged in the matter should be listened to, when they advise the rejection of certain tenders on good and substantial grounds, even though those rejected are among the lowest. As to the morality of inviting tenders with no real intention of proceeding with the work, it stands self-condemned, and in the case of works where the cost of plans and quantities falls upon those who invite tenders, there is an obvious check on the indulgence of such fancies.

CONSTRUCTION OF THE ECONOMY STAIR

By WILLIAM C. A. STEVENSON

THE illustration shown herewith is of a portion of the string in elevation for a box stair (a stair between walls), which is very simple in construction, yet has every appearanee of the housed and keyed stair when completed.

"A" shows the string board, laid out with the square from the gauge line as illustrated, to suit the rise and run. In this case a 9" tread and a 7¼" rise have been used. When the required number of steps have been laid out, bore for the nosing, using a center bit, the size corresponding to the thickness of the tread stock as at P; then saw out the string, leaving that portion that will show above the treads and risers; the strings are then nailed to the wall studs or strapping as the case may be. Now cut the treads and risers the length between the walls and nail them up into the strings as shown in illustration.

Pitch blocks B are then nailed into the angle of the steps underneath; these may be cut from a 2"x6", reversing the cut each time to avoid waste of materials and needless labor, the blocks cut out of the string may be used if desired. The piece C is then nailed under blocks B to form supporters and make ready to receive the lath on the soffitt. If the blocks B cut from the string are used they will drop lower down as seen at B' and C'. The supporters C can be of any size desired; 2"x2", 1"x4" or 2"x4"; ribs should be cut between the studs conforming to the pitch of the string as at D and shown by the dotted lines extended down, to form nailing for the blocks B, as the regular spacing of the wall studs or straps does not provide sufficient nailing places.

It is preferable to have the walls lathed before the strings are nailed up, as this saves cutting in furring pieces to receive the ends of the lath up the pitch of the string both on the top and under edge.

It cannot be said that this stair makes as good a job as the housed, blocked and keyed string. However, if the materials are at all reasonably dry and the workman makes good joints, securely nailing the blocks B and the supporters C, a satisfactory job should be the result. This style will often be found to fit well into play where something cheap is required and a good appearance desired.

REASON FOR BIASED SHEATHING

OCCASIONALLY one sees in the building papers a discussion of the relative merits of storm sheathing put on horizontally and storm sheathing put on at an angle. Generally this discussion turns on the matter of the strength of holding qualities of the sheathing when the fact of the matter is the actual reason for biased sheathing it not so that it will hold the frame together better, but another matter entirely.

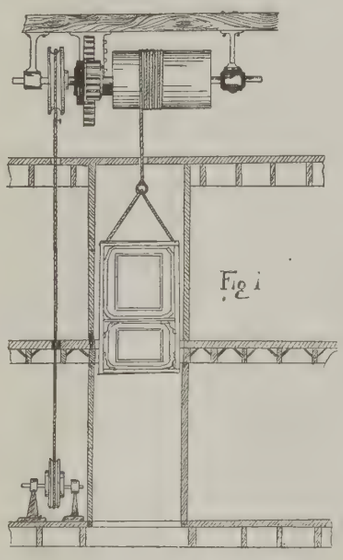
Of course, there is something to argue about in the relative holding or bracing qualities of biased or horizontal sheathing, but either of them well nailed on render a building perfectly safe and secure. And it is strange in view of this fact how many people have jumped to the wrong conclusion in regard to biased sheathing and have assumed that it is put on that way to brace the house.

The real reason for biased sheathing is to prevent splitting the weather boarding from the sheathing shrinking in the final drying out. When you put on sheathing horizontally of comparatively wide stock, say 10-inch boards, there is often a shrinkage in the final drying out of nearly half an inch. Now, if these boards are put on horizontally and thoroughly dry weather boarding is nailed on top of them the piece of weather boarding that covers the crack between two of these sheathing boards is likely to be split by the shrinkage and it is for this reason that wide boards, especially when used for storm sheathing are cut and used biased, or at an angle, say 45 degrees.

This distributes the shrinkage in a different direction and breaks it up so that there is not the same chance for it to concentrate and split the weather boarding.

It is this matter of sheathing that is responsible often for bad looking jobs in weather boarding, of split boards in the side walls when people may think it is the material used in the weather boarding itself. No matter even if it is from boards that are presumably kiln dried, the average sheathing board is seldom thoroughly dried and quite often no effort has been made to kiln dry it. It has simply been stuck up long enough to dry the outer surface so that it can be run on a planer and be reduced to thickness and then it is shipped out and used. To some of the readers this will sound like rehashing something that is perfectly obvious, but there are many others, many who seemingly have not yet realized the exact reason for biased sheathing and among those, those who are arguing about the relative bracing qualities, it should be worth while to consider the matter from a different angle, the angle presented herewith.

Chauffeur—I have been chauffeur for some mighty good people, sir.



Owner—You have?

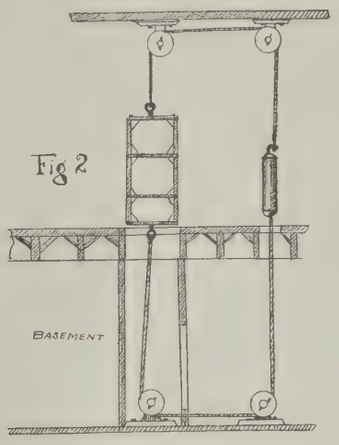
Chauffeur—Yes, sir! You just ought to read the stuff on their tombstones, sir!—Puck.

INSTALLATION OF DUMB WAITERS

DUMB waiters are being introduced in buildings more extensively than in former years. The original dumb waiter, intended principally for carrying dining room supplies from a lower floor kitchen has been developed into a power elevator which is being used for a multitude of purposes. One result of the innovation of the dumb waiter in houses, hotels, restaurants, department stores, factories and shops, has been the need of making plans for the same in the original specifications for the construction of the building.

Nearly all the large builders and dealers in power elevators and dumb waiters will explain that one of the difficulties in the installation of the apparatus is that no preliminary arrangements were made for such devices by the architect. Consequently, in the designing of residences and commercial buildings in which power elevators and dumb waiters might be needed, provisions are now made in the walls and floors for the intended conveniency. A blank place is left in the building for the adoption of the lifting apparatus.

Fig 1



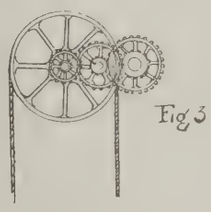


Fig 2

Fig 3

Sometimes the arrangements of timbers in the upper story is planned with a view of attaching the lifting gearing to the same with bolts. Oftentimes, however, the introduction of the dumb waiter or the power elevator means that the machinists who are in charge of the adjusting of the same have to tear out some of the original structure and make room for the machinery and car. All of this is done in a very skillful way in these days. Formerly the saws and axes were used in a reckless manner and considerable damage was done to the floors and other parts of the building in effecting a passage for the car and a lifting point for the gearing. Plastering was torn down, timbers were cut through and masonry was ripped out to an alarming degree. For these reasons, and because of the high cost of the devices, building owners did not interest themselves in power or hand operated elevators to any marked degree. But with the introduction of improved elevators and dumb waiters, with corps of experienced men to put the same in place, and reduced prices for the apparatus, the introduction of the same has increased wonderfully.

It is possible to get first class dumb waiters of simple design, yet good construction, for less than $20.00. The more powerful elevators to be operated by steam or electrical power, of course, run up into higher figures for the apparatus. But when the benefits are considered, users of either the inexpensive dumb waiters or the more costly power elevators seldom complain as to costs. In most cases where your correspondent investigated the users of the devices stated that they would not be without the same at any cost.

In places where trouble was experienced, I observed that reasons existed for the same. In a shoe factory where the management endeavored to rig up a power elevator for the purpose of getting its operatives up and down two flights of stairs in quicker time, and where freight might be lifted and lowered, an attempt was made to put in a second hand car with power-lifting device as in Fig. 1. The cylinder for winding the cable and the gearing for operating the same was of home-made design. It proved to be a dangerous affair and the power operating part was cut out after the car fell a number of times.

Then the rigging was installed for operating the lifting gearing by the rope extending from the grooved wheel keyed to the end of the shaft of the lifting gearing as shown. This rope extends down to the grooved wheel on the lower floor. Hence, someone standing on either floor, outside the car, can run the car up and down by pulling on the rope. This crude arrangement does its work in a half-way manner and saves time and labor. But it is going to drop some day and someone will get injured. In another place I noticed that they had a home-made arrangement as shown in Fig. 2. I was afraid to try this car until I was assured that the car did not have much of a trip anyway, and in case of a drop it would not be more than a dozen feet. The cut shows the crudeness and risk of the device. Of course, it is intended only to carry stock up and down, but the operatives were in the habit of riding on top, steadying themselves with the rope, as this made it easier than going up and down the stairs.

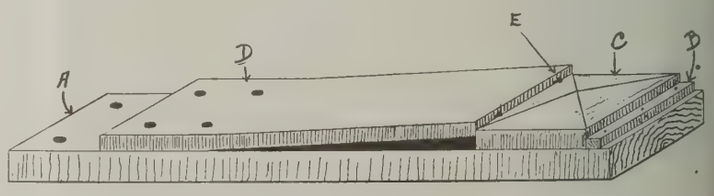

Fig. 3 shows a form of gearing used in some cases for the operation of the cars. The power elevator and the dumb waiter are excellent devices when properly installed and used. First of all I would not trust to elevators constructed by inexperienced local help. In most cases the elevators are purchased from reputable builders, but you will always find a few patched up elevators in use and these will shock anyone who realizes the danger connected therewith. The modern elevator for the home, the factory and the public building is one of the greatest inventions of the age.

A HANDY BENCH CLAMP

By W. A. LANE

ONE often gets bench work that is a puzzle to hold securely and work to the best advantage as the ordinary bench is limited in its clamping arrangements. Not all can afford the patent ones which are double back acting, ball bearing, and if the cost was not of importance they are not always at hand.

I was once in rather a predicament when I found that I had to clamp quite a number of beveled face blocks 2″x6″x6″ by hand, so I put my wits to work and from some scraps I soon had the following clamp that was perfectly satisfactory: A is a piece of

2″x6″ about 3′ 6″ long; about ¼″ from one end nail a strip B, ½″x¾″. This acts as a stop for the block you are to work. Next place your block C against the stop B. Next select a piece of soft 1″x6″x2′x6″ for the spring D; push it tight up to block C, and on the other end nail it down with three or four nails, remove block C and in the end of the spring D drive in two small nails E. Let them project about ½″ and they will block C nicely in place. Now with a draw knife and jack plane you can shape the block as you want it. This clamp can be tacked almost anywhere you need it and with some modification can be made to hold other kinds of work.

Agent—Madam, have you a piano?
Housewife—Yes.
Agent—I am selling an attachment which I am sure———
Housewife—We have one.
Agent—What make is it?
Housewife—Sheriff's.—Cleveland Leader.

THE VALUE OF ZINC ROOFS

By H. M. SANDERS

ANOTHER point about the use of zinc roofs, they are rarely painted, especially steep roofs. Though it is thought that by painting a comparatively flat zinc roof, it would add five years or more to its life. But rarely, if ever, advised for steep roofs, as the painting is more likely to wash off.

The commercial name of the zinc before it is made into sheet form, is spelter, and the quality of the sheets depend upon the purity of the spelter from which the sheets are made.

Iron is one of the alloys of zinc that needs to be eliminated as much as possible, for if present to any appreciable extent, acts upon the zinc, and will eventually destroy it.

But this grade of zinc V. M. is distinguishable from these other cheaper grades because of its light evenness of color. Whereas the cheaper grades are of a darker color, with more or less of a mottled appearance, caused by the presence of alloy of larger quantity, and sometimes of a different character than the alloy in the V. M. zinc, as above analyzed, and hence is more likely to crack at the bends required in working it into shape and form.

When a roof is to be covered with sheet zinc, the roof boards should have close fitting joints and a smooth surface for the zinc to lay upon, and should always run with the pitch of the roof. Otherwise the covering of the roof will not, generally speaking, prove satisfactory. The extra cost of laying the boards properly so as to have a smooth even surface for the zinc to lay on, is a small matter, as compared to securing a longer life to the zinc roof, which is sure to follow such a method of preparing the roof boards, especially if one takes into account that there may be more or less traveling upon it.

Now as to the size of the sheets of zinc used principally for roofs, 3x8 feet is the usual size for flat, or comparatively flat, roofs. On steep roofs the size of the sheets other sizes may better meet the needs and requirements of the case. Though unlike other sheet metals, the number of sizes of sheet zinc is limited to a very few sizes. That in commercial use generally is of the size named 3x7 feet.

As to the weight of the sheets per square foot, that which is generally considered best for roofing purposes, is No. 16 which is about the same gauge of No. 19 sheet iron and weighs 24¾ oz. to the square foot. Any heavier zinc than No. 16 is considered unpracticable to use, as it is more difficult to work in to shape and form, and more likely to crack in turning up the edges of the sheets.

A flat, or comparatively flat, zinc roof, like that of the lead roof, has its roof drips, with the only exception perhaps that the roof drips are closer together on a zinc roof than on a lead roof, as it is put on in smaller sheets. In a lead roof these drips are usually about 10 feet apart, running crossways of the roof, and at right angle with the pitch of the roof; the roof drips of the zinc roof running the same way. But the zinc sheets being usually from 7 to 8 feet long, the roof drips must be about six inches shorter than the length of the sheet zinc used for the roof, in order to provide for the laps and fastening at each end of the same. The depth of the drip vertically, about 2½ inches.

One English writer on the subject says that theoretically speaking, he believes that zinc roofs should be laid without the use of any solder. But in practice it is found that in working around corners and openings of a zinc roof necessitates the insertion of gussets that require to be soldered, to make the roof tight at these points.

"Then again," he says, "there is a small detail in connection with this part of the work where soldering is required, which he claims is often overlooked and often with disastrous results.

For in soldering the zinc, the worker of course uses what he terms a "soldering bit," but what in this country is termed a "soldering iron," or "soldering copper." This "soldering bit" as he terms it, is continually being cleaned with a file, and these fine copper filings, that come from the soldering bit, if left on the zinc roof, set up, when there is rain, a galvanic action which quickly eats through the zinc, leaving a series of pinholes or perforations, through which the falling rain is sure to find its way.

While this fact as instanced might account for the roofs leaking, under the conditions named, be the zinc itself of the purest quality that can be obtained. But we do not wholly coincide, with the idea, that it is difficult to conceive the possibility of remedying the complaint made, some times against zinc roofs, as well as those roofs covered with other kinds of sheet metal. Workmanship must be taken under consideration, as all know who have had any practical experience in such matters.

Poor workmanship means a poor roof, be the material of which the roof is made ever so good a metal. Then again, we must take under consideration the fact that all sheet zinc used for roofing purposes is not of the same quality.

While we are led to believe that practically all the sheet zinc manufactured in this country, is perhaps as pure metal as any manufactured in Europe, yet all the sheet zinc manufactured there is not of the same quality. Owing to the increased demand for zinc roofs in some of those countries has led to the starting up quite a number of manufactures of this sheet metal and some of them, at least, are introducing an inferior quality of zinc.

In any event it behooves the zinc roofer to keep the roof swept clean, and free from these copper filings. There should also be a layer of felt under the zinc roof.

In regard to the method of construction of zinc roofs, there are various kinds. There is the method already spoken of, where

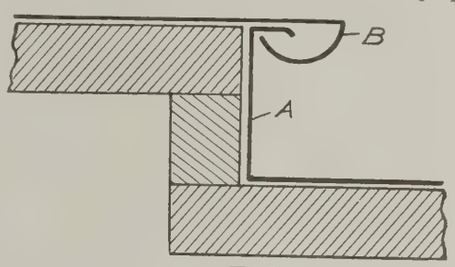

FIG. 1
Zinc Drips

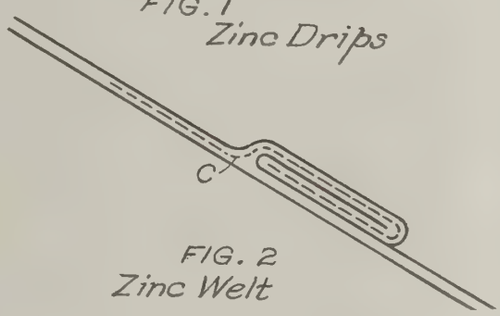

FIG. 2
Zinc Welt

roof drips are employed at intervals along the pitch of the roof and which run crossways from side to side of building, and are constructed as shown in Fig. 1. The distance between these roof dips along the rise or pitch of the roof, are made to suit the length of the sheets of zinc used for that roof, as already explained.

These drips, a section of which is shown in Fig. 1, are from 2 to 2½ inches deep, and so constructed as to allow for free expansion, when the end of the lower and upper end of the two sheets are joined together. The form of the ends of the two sheets is shown in Fig. 1, at a for the top edge of the lower sheet and at b for the bottom edge of the upper sheet.

This method of making cross seams is only used on comparatively flat roofs, as it is not deemed necessary on steep roofs, or where the pitch of the roof exceeds 2½ or 3 inches to the foot. In such cases, the welt seam as it is called, and as shown in Fig. 2, is deemed the best to use. The width of the edge turned up for making these welt seams on top and bottom of the sheets are one inch wide and form a lock seam joint as shown. The top edge of the under sheets being secured to the roof boards by means of cleats, as shown by dotted line C in Fig. 2, and placed from 6 to 8 inches apart. The cleats being 1½ to 2 inches wide and nailed to the roof boards.

(To Be Continued.)

"Do you Americans really appreciate the beauties of nature?" asked the foreigner.

"Sure, we do," replied the patriotic citizen. "Can't you see evidences of our appreciation in the sardine cans and pickle jars that picnic parties scatter over every good piece of scenery?"—Washington Star.

BUILDER'S COURSE IN ARCHITECTURAL DRAWING

RALPH F. WINDOES.

(Continued from January.)

SHADE Lines.—To give drawing a better appearance and to make raised or depressed portions of them show more clearly on the paper, shade lines are sometimes used. They are lines about three times as heavy as full lines, that are often used on detail drawings and elevations, but very seldom on plans.

There are a number of principles used in determining which lines are shade lines, but the most common one is to suppose light rays to strike the object at an angle of 45 degrees from the upper left hand corner. The outlines of those surfaces that the light falls directly upon are put in full lines, but the outlines of those surfaces that the light does not touch are put in shade lines. In common practice it is assumed that the lower and right hand lines are shade lines.

To more clearly illustrate this let us look at Figure 18. Here we have two triangles, one 30x60 degrees and the other 45 degrees, made of material thick enough to cast shadows. Placing the 30x60 degrees on its shortest base, we find that the light would fall directly on sides a, b and c, and miss sides d and e, which would be put in as shade lines. Side f is a right hand side of the material which surrounds it, therefore it would be put in as a shade line.

The 45 degree triangle, placed on its longest base, would have but two shade lines, e and f. F because it is an interior right hand side, and e because the light rays would miss it entirely. It is easy to see why the other lines would not be shaded, bearing in mind that the light rays fall at an angle of 45 degrees from the left.

Shade lines are always drawn outside the original lines of the figure, and should be put in after the figure has been inked (—) entirely with full lines. Dotted lines are never put in as shade lines.

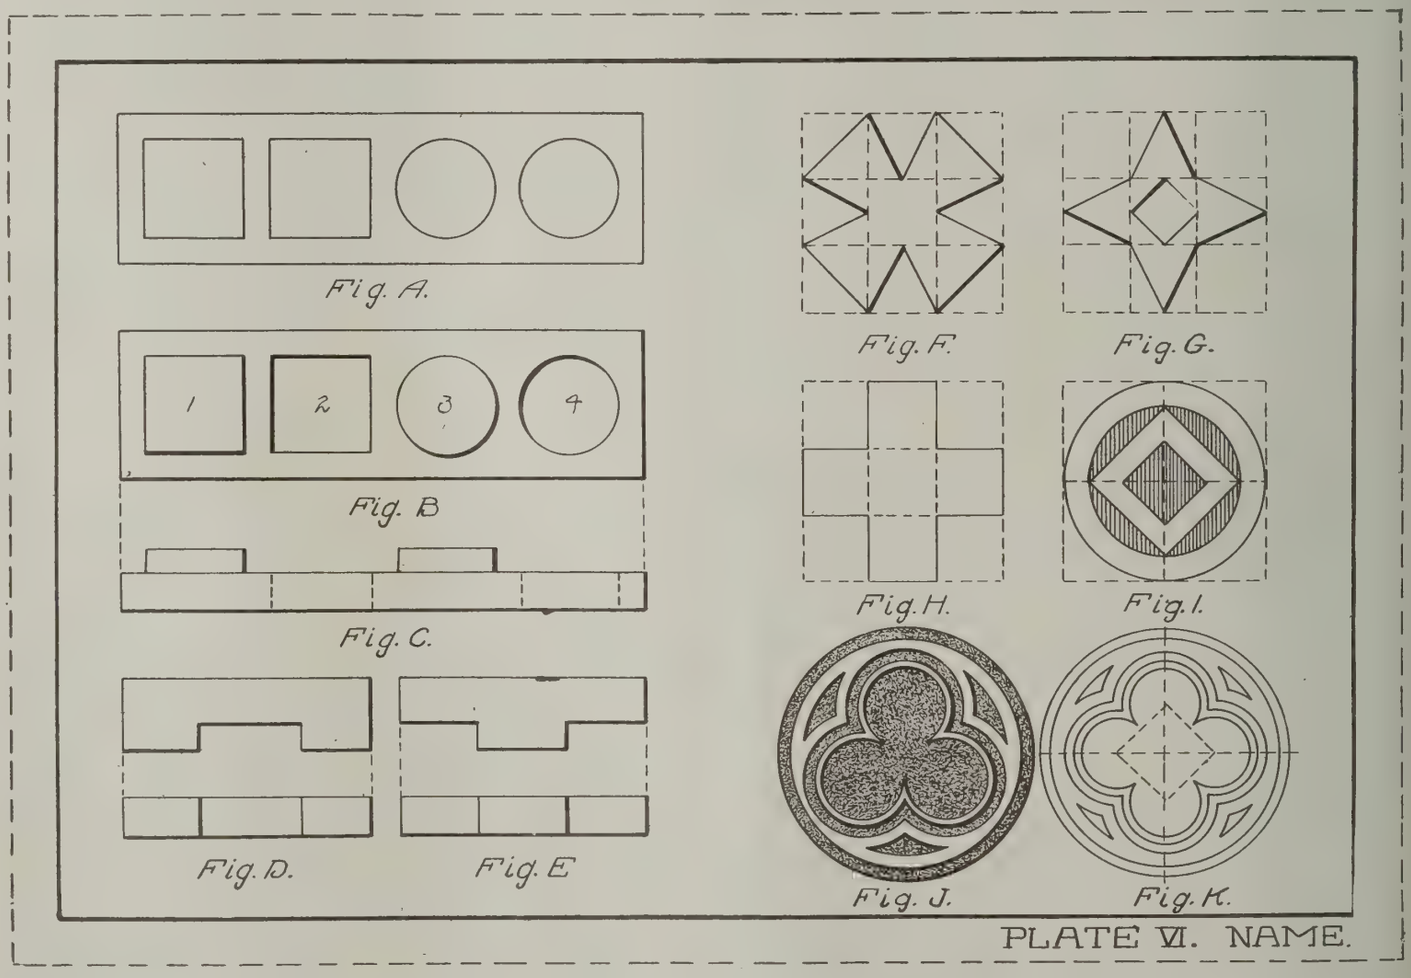

PLATE VI.—SHADE LINES.

Lay this plate out as you did the others and place the figures on it as you think best. No dimensions are here given, this being left to the discretion of the student.

Let us suppose that Figure A is the top view of a block of wood, drawn without shade lines. There is no way for us to tell from this figure whether the block has two square and two round holes in it or whether it is surmounted by two square and two round pieces.

Now let us look at Figure B. Here we find some shade lines used, and bearing in mind the principle which governs them, we can easily see that 1 is a raised square, 2 a square hole, 3 a raised cylinder, and 4 a round hole. As a further proof that we are correct Figure C is given. It is a side view of Figure B and shows which portions are raised and which depressed.

To determine the location of the shade lines on 3 and 4, Figure B, let us consult Figure 19. The shade lines on circles begin at the points where the light fails to strike the edges. These points are determined, as shown, by placing the 45 degree triangle on the T square and holding it tangent to the arc. For an interior

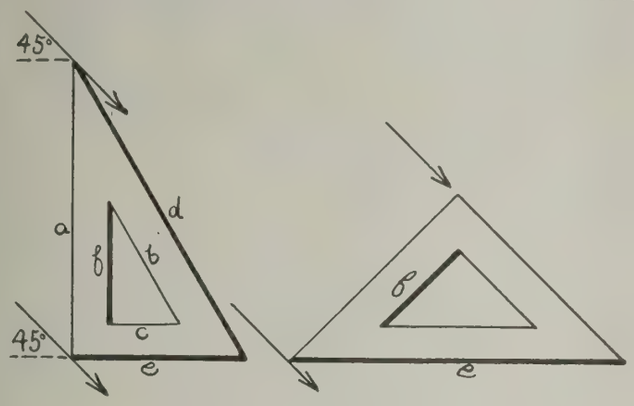

FIG. 18.

circle, the opposite side is shaded, but the points where the shade line begins and ends are found in the same way. In inking them in, a new and distinct center must be made at an angle of 45 degrees from the original center. In Figure 19, 1 shows the original

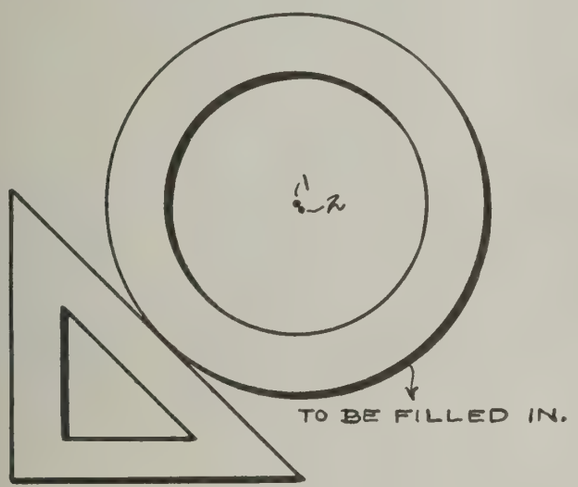

FIG. 19.

center and 2 the shade line center. The heaviest part of the shade is about three times as heavy as the original line, the same as with straight lines.

Figure D gives the top and side views of a piece with a por-

FIG. 20

tion cut out of its lower side. Figure E gives the same views, but with a projection on the lower side. The rules which govern the shade lines on these figures is already known, so no explanation of them is deemed necessary.

The next six figures are given to illustrate the use of these lines on architectural ornaments. They also offer good exercises for the use of the drawing instruments, and great care should be taken in constructing them.

The first three are drawn by producing a square and dividing it into nine small squares. Then certain points on these are connected, giving the desired figures. Figure F is a Maltese cross and Figure G is a star shaped ornament with a square cut out of its center. The shade lines are easily understood as they are all located with the 45 degree triangle.

In Figures H and I no shade lines are given, this being left as a problem for the student to solve. Figure H is a Greek cross and as all the lines are either verticle or horizontal, the rule of the lower and right hand sides can be easily applied. The shaded portion of Figure 1 shows a depression and the shade lines should be put in accordingly.

Figures J and H give good practice for the use of the compasses and they are not difficult to draw. Figure J represents the trefoil of the Gothic style, as used on windows and other decorations. It is here shown with the shade lines in place and the depressed portions shaded. Figure 20 gives the construction of it, and it is formed as follows: Draw the equilateral triangle as shown by the dotted lines a, b, c, then bisect it as at cf, which gives the center for the surrounding circles; a, b and c are the centers of the trefoil curves.

Figure K is the quatrefoil and is formed in a manner similar to the trefoil, excepting that the square is used in place of the triangle. Here the shade lines are omitted, also the background, but the student can easily put them in after copying Figure J.

Throughout the remainder of this course shade lines will be used to a large extent.

(To be continued.)

OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without charge, and any questions or experiences will be given proper space.—Editor.]

ANSWERS

TIN ROOFS.

From "T. T.," New York.

Replying to R. O. N., Scranton, Pa., I send you the following: In a book recently published I notice that it is not advisable to paint a tin roof until it has been laid at least thirty days. This delay was supposed to be necessary in order to have the tin washed clean, and so get rid of the grease, resin, etc. In the eastern part of the country any such delay results in giving the tin a slight coat of red rust. This, of course, makes the paint flow beautifully. Everybody likes it, but when the tin once gets started there seems to be no end to its rusting. It goes on all the same, whether covered with paint or not. It is all very well for the tinman, but how is it for the man who pays the bills? What we want to do is to make the roof last as long as possible with the least amount of repairs. Paper, tar, asphalt, iron and other kinds of roofings are coming into use largely because of poor tin roofs. It is for the interest of every tin man to put on as good a roof as possible and make it last. Now, to do this rust must not be allowed to start. The tin ought to be painted before the plates begin to show red. Then the roof is safe, and if properly cared for there is no danger that it will give out before its time. I hold that such a roof, painted at proper intervals, will last forever."

Some persons seem to forget that there are two surfaces to a sheet of tin. They see the upper surface and take care of that, but forget that the under surface equally needs to be kept free from moisture. Water on the under side of a tin roof will produce rust about as quickly as water on the top surface. To prevent sweating and condensation of moisture on the under side of a tin roof is a point which must be guarded against by thorough ventilation if we would make the roof last.

SHINGLE ROOFS.

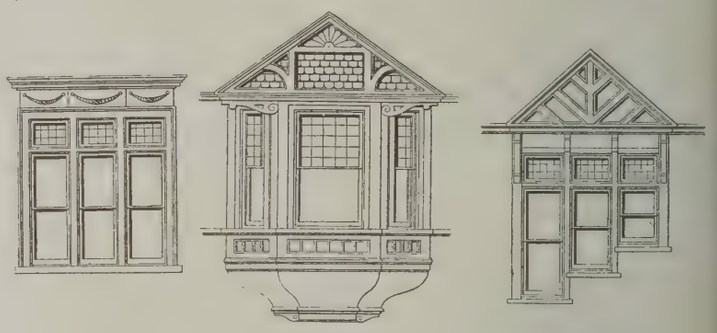
From "Old Hand."

Answering Michael L., Green Bay, Wis. A shingle roof should last at least twenty-five years. Of course, much depends on the shingles themselves and on the locality. Shingle roofs should have a pitch of at least 7 inches to the foot, 12 inches to the foot commonly known as one-half pitch is much better.

It is a well known fact that the steep shingle roof is the one that outlasts all other wooden roofs. The steep roofs afford no place for the lodgment of snow and rain, and soon dries out after the storm has subsided, consequently it is a better water shed and a more durable roof.

Another item in the roofing of a building is the painting. It has long been a custom to not paint shingle roofs. This is probably due to the fact that it is a saving in the expense of building to leave the roof unpainted. The first cost may be reduced by leaving off the paint, but it is no saving in the end. The paint will add to the lasting qualities of the roof much more than the cost of the paint. There is not the slightest reason to show why a shingle roof should not be painted, as well as any other part of the building. It has to take the worst drubbing the elements of destruction can give in almost every case, and the paint will be found to be a great preservative. It is not necessary to put on a high priced paint, but by all means paint the roof if you want it to last. Not only paint it when you build, but give it another coat of paint every two or three years; it will be cheaper than a new roof every six or eight years, or one that has to be frequently patched and repaired.

TAR AND GRAVEL ROOFS.



From G. J. B., Valley Stream, Long Island, N. Y.

Answer to A. J. C., Erin Springs, Okla., on tar and gravel roofs. The best method to my mind is the following: Cover the roof boards with a layer of sheathing paper with one inch lap, over which lay two full thicknesses of tarred paper, lapping each sheet seventeen inches and nailing only where necessary; over this spread a uniform coating of pitch, mopped on. Then lay three full thicknesses of tarred felt lapping each sheet twenty-two inches over the preceding one. When felt is laid and secured mop back with pitch the full width of twenty-two inches under each lap. Then spread over the entire surface of the roof a uniform coating of pitch, into which while hot embed slag or gravel. The pitch should be of the best quality of straight run coal tar not less than 120 pounds per 100 square feet. The slag or gravel should not be less than ¼ inch or more than ⅝ inch in size, dry and free from dirt, 300 pounls to the 100 square foot. This is termed a five-ply roofing, and can safely be guaranteed for at least ten years.—Geo. J. Birch.

BAY AND STAIR WINDOWS.

From "W. B.," Hartford, Conn.

In reply to "Joe W.," Manitowoc, Wis., I send you three inclosed designs which I think will be of use to your subscriber.

BAY AND STAIR WINDOWS

FIREPROOF ELEVATOR SHAFTS.

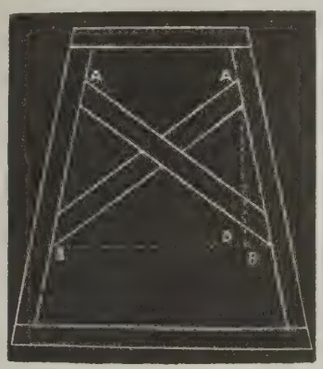
From "Builder," Detroit, Mich.

Answer to "Chicago Man." It would be somewhat difficult in the limited space of an answer in this department to specify and explain all the necessaries required to build a fireproof elevator shaft. It would be better for "Chicago man" to consult some fireproof building expert. However, I send you the inclosed, which will probably be of some use.

The interior of the shaft should be lined with corrugated iron, or, what is better, with bright tin securely fastened to the woodwork. The very best fireproof doors that are made are constructed of wood, upon which sheets of tin are placed in such a manner that the flames cannot penetrate at any point. It has been repeatedly demonstrated that doors of this kind, properly constructed, will resist heat much longer than the ordinary iron doors or doors of any other material. If elevator shafts were constructed in this way, with the openings at the different landings so made as to close tightly, thereby hermetically sealing the shaft, this would then become a great flue to carry away the smoke and flames generated in the building. If at the top of the shaft a glass skylight was placed, a free exit for the flames would be afforded, for the heat would very soon break the glass and make the opening complete. This mode of construction is now required in theaters generally, the skylight being placed over the stage, so that in case of fire the flames may break through the glass and, finding an escape to the outer air, be turned away from the auditorium, thus permitting the audience to disperse without being suffocated by either smoke or flames.

A TOOL TO FRAME ANY ROOF.

From W. E. W. of Parsons, Kans.



Replying to J. A. B. of Lake Megantic, will say that he might use the method of stepping the rafter with the steel square, but if

he will write the Parsons Manufacturing Company of this city, they will mail him circulars of the Milks Framing Instrument, which will frame any roof that ever was built without a draft. I have been using one for several years and would not be without it for many times the cost of it. Yours truly, W. E. Widmer, contractor and builder.

TAPER FRAMING.

From "W. W.," Buffalo, N. Y.

In answer to "John W. K.," New Ontario, Ont. Your correspondent is rather indefinite, but I think the following will explain his wants: The cut represents a frame, the posts of which incline one foot in six feet rise. Let the distance B B represent seven

feet. The braces are run at an angle of 45 degrees. The post, inclining one foot in six, leaves the distance at A A six feet. In this case the brace would be 8 feet, 5 13-16 inches.

TO GET BEVELS AND LENGTHS OF RAFTERS.

I have seen the question asked by "V. A. B.," Lake Negantic, in the January number of THE NATIONAL BUILDER, and in reply will say that I have bought one of the ABC protractor squares manufactured by Crookston Tool Company, Crookston, Minn., and with it I can get any length or bevel for hip, valley, jack and common rafters, as well as any other cut needed. The directions with the tool describes fully how to do it.—Edwin S. Baker, Pasadena, Cal.

PICTURE BY RUBENS.

From "W. H. H." Huntington, L. I.—In reply to "Clam-digger," South Norwalk, Conn.—The following tradition regarding this picture may be of interest to you. It was given to me some years ago.

"Ruben's Great Picture in Antwerp Cathedral."

St. Christopher, who I own to being an especial favorite of my own, died July 25, A. D. 250, and hence of course, had no more to do with taking down the crucified Christ from the cross, than I did. Yet it is perfectly correct a large representation of him upon the outside of "Rubens" greatest picture the "Taking down from the cross," now hung on the east wall of the south transept of Antwerp's celebrated cathedral, may be seen by all who care to look thereat.

It may be asked in passing why St. Christopher, of all the saints, is my particular favorite? I will tell you. The gentleman in question was originally known as "Reprobatus." He was a heathen giant, of immense strength and apparently a very good sort of a man into the bargain. Somehow he had long possessed a sort of a hankering after religion and on one occasion called at a monastery near where he resided and asked the monks who lived there what he had better do. "Join us. Come in here and spend your time like us in prayer and fasting." "Not me," replied the mighty man contemptuously, extending as he spoke the knotted muscles of his brawny arm with pride. "Not me. I don't want to become one of a milk and water pale faced lot like you chaps are." So he went away. Months afterwards he returned still in some trouble of mind. The matter was again talked over, but the well meaning Hercules absolutely refused the renewed proposition that he should join the community and waste his time in their midst, in meditation. Then a sudden idea struck the chief priest. "Reprobatus," he said, "God has blessed you with great strength. He commands that you use it in his service. You know that dangerous ferry not far from here where so many poor people have been drowned from time to time in vain attempts, on stormy nights, to gross? Go there and build thyself a hut—reside in it and do thy best to help those who are anxious to go across." At this Reprobatus fairly jumped for joy. "Oh, if that is religion," he said, "I am on the job at once, but I do draw the line at praying!" So the priest having blessed him, he did as he was bid. One very rough night long afterwards as he lay sleeplessly in his hut he heard the voice of a child crying. He went out and under a bush found a little lad. The youngster implored him to carry him over the waters, whither his parents had already gone, having left him behind. So he got his staff, lifted the wee one on his shoulders and entered the stream. But the waters arose, thunder and lightning raged, and his burden got as heavy as lead, so much so indeed that "Reprobatus," sturdy man as he was, was in great anguish and was afraid the pair of them would be drowned. By tremendous efforts, however, he at length reached the opposite shore safely, and as he sat down the child and wiped the rolling perspiration from his brow he remarked: "Why, you seem to have weighed as heavy as the whole world." "Well said," was the reply. "I it was who created the whole world; I redeemed the world; I bear the sins of the world." Then the fair boy vanished from sight and the strong man realized it was the child Christ he had borne over the stream. Thus then it come about that his name forever afterwards was changed from its original to "Christopher," the Christ-bearer. The moral of this fable (for, of course, a fable it is) is most excellent. It points out that it is not absolutely necessary nor given to every man to pull a long face and pretend to feel nine times out of ten what he does not feel. I know good men belonging to all sorts of Christian denominations, from self-denying Salvationists to earnest Roman Catholics, and honor each and every one from my heart and I have further met on my travels good people of other religions not within the Christian pale. Parsees and Mohammedans, who, as a rule, are often a deuced sight more religious than are the majority of ourselves. It is well, therefore, to realize that every man has his particular vocation in this life. He may not be a regular attendant at a place of worship, he may not be a praying man, but still there is work for him to do, be it ever so humble, and if he exercises self-denial and in ever so small a way benefits his kind, his life is not altogether in vain. Let us therefore always remember the story of Christopher. He refused to pray, he declined to fast, but when he cheerfully devoted his bodily strength and energies to the assistance of the weak and in helping those in trouble God honored his modest efforts more than ever man was honored before or since, for he it was who saved the child Christ from drowning. And now, after this somewhat lengthy digression, let us go back to Rubens' celebrated picture.

First of all, let us see who the man himself was. Peter Paul Rubens was not an original native of Flanders, but a German born in A. D. 1577 at Seigan in Wassau; he died A. D. 1640. He came to Antwerp in early life and his genius was so pronounced that at the age of twenty-eight he was made the master of the Painters' Guild there, i. e., he occupied much the same position in the Flemish school at Antwerp, as does the president of the Royal Academy in London, England. I do not mean by this that Royal Academicians are always great men. Kissing goes by favor, and it is well known that some men who have written R. A. after their names are mere duffers and pictures worth little more than the frame they are hung in. But Rubens was admittedly a man of great genius. He was appointed court painter to the governor of the Netherlands in 1608, and some twenty years later Charles I had him over in London, knighted him, and gave him the commission to decorate the Royal banqueting hall at Whitehall. Now it must not for a moment be thought he did everything himself. Van Dyke, Teniers, Snyders, Broueghel and others bearing honored names in the history of Flemish art were his pupils. Every man has his hobby—or ought to have—quite outside of his usual vocation, and Rubens spent much of his leisure in gardening. He was a great florist as well as a celebrated painter. The ground adjacent to his own residence at Antwerp belonged to an ancient society known as the "Arquebussers," an old Flemish guild still somewhat in evidence in Flanders. But it was a wealthy sort of a club and when Rubens approached it, anxious to extend his borders and buy the land, the members distinctly declined to listen to his tempting offers. But although insensible to money, they consented at last to relinquish possession on condition that he painted

them a large picture representing their patron saint, St. Christopher. This he readily consented to do, but what this particular saint had to do with Arquebussiers, i. e., crossbow shooters, he could not for the life of him make out, nor could anyone tell him, so for a long while he was at a loss for a suitable subject. At length the very etymology of the word, Christopher, a Christ or cross bearer, afforded him a sort of hint and on this he immediately began his great picture entitled, "The Descent From the Cross." For months he worked laboriously at it, taking an interest in every detail such as he confessed he had never devoted to any other work.

He felt it was to be his "chef d'oeuvre" and as he proceeded he began to eagerly anticipate the moment when he should display it before its future possessors and he would receive their congratulations upon his success. At last the day came. The Arquebuss men assembled in a body in Rubens' studio. The curtain was drawn away and the triumph of the great painter's genius stood unveiled before them.

Tableau: Not a person spoke—indeed, every face showed intense dissatisfaction—and at length as it were with one accord the question came from every lip: "But where is St. Christopher?" In vain the painter explained that the picture was the greatest he had ever accomplished, far superior to what he had contracted to give them. To a man they stood obstinate. St. Christopher they wanted and St. Christopher they would have. Some of the more moderate ones suggested that as there was a small space left on the corner to the left of the painting their patron saint might be introduced there, but Rubens explained such an anomaly would ruin the whole composition. Hence he rejected the proposition in distinct disgust.

So the Arquebuss men departed, refusing to accept the picture or part with the land the painter yearned for.

For a long time afterwards things remained in this unsatisfactory state.

It was the Burgomaster of Antwerp, a great admirer of Rubens' genius, who at last came to the rescue, said, "Why not paint St. Christopher on the outside of the shutter, to be seen when the picture is closed, as it mostly will be, save only on state occasions.

"There is plenty of space there and you can make him as large as you like." Rubens laughed at the proposal, seized his brush and sketched it on there at once. The Arquebuss men were then once again asked to visit the studio, this time at once beholding their patron in fine fettle, they professed themselves perfectly satisfied. Then it was a bargain for the land immediately concluded, and the picture in due course was hung up in a place of honor by the members of the club in the Cathedral. There it has remained ever since, save that during the French invasion it was carried off to the Louvre in Paris, from which, after the proclamation of peace, it was brought back to its original home.

QUESTIONS

OLD MISSION PULPIT.

From "S. R. R.," Spur, Texas.
Editor NATIONAL BUILDER:

I would like if possible to see a pulpit in "old mission" style, if some of our readers could furnish a design.

NURSERY CHAIR.

From "G. E. W.," Huntington, Pa.
Editor NATIONAL BUILDER:

Would some kindly disposed fellow reader give a sketch of an "infant nursery chair"?

DETAILS FOR SIDEBOARDS, KITCHEN CABINETS, ETC.

From "F. M. S.," Sacramento, Cal.
Editor NATIONAL BUILDER:

Would like to see printed some details for dining room china closet, sideboards, etc., and also for kitchen cabinets, shelvings and sink arrangements.

CLEANING OFF CEMENT.

From "J. D.," Buffalo, N. Y.
Editor NATIONAL BUILDER:

Would some one kindly tell me if there is a better method of cleaning cement mortar off rough faced brick than by the use of muriatic acid?

DRAUGHTSMAN.

From "S. S.," Lagrange, Ind.
Editor NATIONAL BUILDER:

Am anxious to become a draughtsman. Would like to get some pointers as to the first steps to be taken and would be pleased if any brother reader who has gone through a course of "sprouts" could kindly oblige by giving me suggestions or hints to begin with.

INTERIOR FINISH.

From "C. E. H.," Urbana, Iowa.
Editor NATIONAL BUILDER:

Would like to see something more on inside finish, cupboards, pantries, etc., and the kind of woods used for these purposes.

SHINGLE DIP.

From "C. G. W.," Rome, N. Y.
Editor NATIONAL BUILDER:

Will some one please give recipe for making shingle dip or stain that does not contain linseed oil?

TO FRAME A CIRCLE PORCH.

I would like to know the best and most substantial way to frame a circle porch.—J. P. Gardner, 723 Thirty-seventh street, Cairo, Ill.

WHAT THE EDITOR WOULD LIKE TO KNOW.

1. What has been to you the most interesting and helpful information given during the last year?
2. What do you think would be most interesting and instructive to you during the coming months?
3. Why do mechanics in general neglect to keep abreast of times, by study; while we find ministers, lawyers, doctors and all professional men studying hard with their daily practice?
4. What new tools do you know of that are not, or you have never seen, advertised?

CEMENT CRACKING.

From "J. R. J.," Bridgeport, Conn.
Editor NATIONAL BUILDER:

I am writing to find out why the cement cracks on the exterior of a new cement job. The structure had been clapboarded. These were removed, the sheathing was laid diagonal, and on this were 1x2 laid 12 inch centers perpendicular, 16 inch horizontal to take the width of expanded metal lath, put out by the Northwestern Expanded Metal Company. The cement was proportioned thus: 3½ sand, 1 cement (Atlas Portland), 1 lime putty; second coat, 4 sand, 1 Blancho cement, 1 hyd. lime dash. It has cracked in three directions at different angles, some of the cracks 12 feet long. If you could tell the reason and a cure you would oblige a constant reader.

WATER FRONT TROUBLES.

To the Editor:—As your questions and answers have been of great value to others I am going to write you my troubles and see if you cannot be of benefit to me.

The hot water for bath and general use is heated by a coil of the city water running through the front of our range, but the trouble occurs for the simple reason that in about a year's time the pipes get all limed up, and we have to put in a new coil, which is not only some expense and bother, but if not attended to at once there is great danger of a real blow-out, as has occured right when my wife was arranging a big dinner for a full house of company. Now the last coil was put in with more than usual care and the plumber was a good one and he felt sure it would last three years at least, but I took it out last night so we can get a Sunday dinner today and will have the plumber put in a new one tomorrow. Now what I want to know is how to keep the coil from getting limed up. Somebody surely ought to know something, but I will admit with all my experience as a builder I am up against it in this proposition and have been for years.

Of course, I know I can get a regular water front for the range instead of the coil of pipe, but every plumber I have asked about it has told me it would be no better. Yours,

D. L. STODDARD.

REVIVAL OF THE PAINTED WALL

TO LENGTHEN the span of life and the pursuit of happiness is the dominant passion of man. Its inspiration is a love for the beautiful. Its incentive, the works of nature. Its expression, his imitative genius. Its realization, the splendors of modern architecture, the grandeur of public and private buildings, the magnificence of homes.

An empty room with barren walls and ceiling, however it be fashioned, is nothing, but possess such room with decoration, color, draperies, and it becomes fitting for the inhabitance of man. It is in evidence everywhere that the revival in favor of tinted walls is in full favor. The soft restful shades and tints in plain effects, or embellished with borders, stencils, scrolls and freizes, or in delicate traceries, are the fashion of the day.

Kalsomines have had their place for a number of years and their restful tones are desirable, and their price an incentive, but they are not durable and, therefore they are not really economical. Kalsomines are said to be made of decomposed animal matter (glue), and after application they easily powder and rub off. If they become soiled they cannot be washed or cleaned.

Everything in this world is a development, as everything and every idea is possible only because other things and other ideas preceded it. Nothing happens by chance. Cold water paints have been right in their way, but they lack some of the material points necessary for modern interior decoration. Washable Flat Paints are devised to meet the shortcomings of water paints and they do it well.

MODERN PAINT FOR FLAT EFFECTS IN INTERIOR FINISHING.

Beautiful to look upon, restful to the eye, marvelous in wearing power, simple of application, remarkable in covering capacity, economical and satisfying in every way, are the manifold attributes which are possessed and made possible in washable Flat Wall Paints.

Washable Flat Wall Paints are the modern flat drying paints, with which are produced the finest effects in the finishing of wall board on walls and ceilings.

They make a soft-velvety finish of surpassing richness and beauty. They look like pastel. They combine the gentle restfulness of kalsomine or water paint with the really washable qualities of oil and varnish.

When the finish becomes soiled or stained it is to be scrubbed down with soap and water in the same manner as any varnished or painted surface. This is accomplished without in any degree diminishing the quality of the finish.

After deciding upon Wall Board for the wall surface, the next question is its treatment.

The flat, uniform surface of Wall Board offers splendid opportunity for economical finishing. In fact, superior to plaster or metal.

In the special treatment that wall board undergoes, the material is of like porosity throughout and when the paint is applied it dries with an evenness of finish that is impossible with plaster, owing to the difference in the lime or manner of troweling.

The change in wall decoration has been slow but sure, developing first in the more pretentious buildings, later being used in the best and most modern residences, and now since the necessary materials are being provided in better form, come within reach of the average home builder.

Formerly the only painted wall possible was the glossy kind, suitable only for kitchens and lavatories, so that this change is due to two reasons; first, the demand for a more artistic finish of reasonable cost and, second, the successful effort of manufacturers to supply that demand.

A plain flat painted wall has many advantages; it forms an ideal background for pictures; it is soft and restful to the eye and it adapts itself readily to a variety of color schemes.

Where there is a preponderance of plain surfaces, one can easily obtain the necessary balance by stenciling in some neat design, or the usual plan of paneling wall board overcomes this trouble itself.

The greatest advantage of having and producing painted wall board lies in the pleasure of individual treatment and decoration.

Washable Flat Wall Paints are made in many beautiful shades which will harmonize with any plan of interior furnishing and are prepared in liquid form ready for the brush.

BOOK NOTICES

AUTOMOBILE MECHANICIAN'S CATECHISM.—A series of examination questions and answers prepared expressly for the use of owners, chauffeurs, garage men, and automobile machinists. More than 400 questions and answers covering every detail of automobile design, construction, operation and repair work. Will be found to be a most valuable aid to all persons contemplating an appearance before a board of examiners for the purpose of obtaining a chauffeur's license. By Calvin F. Swingle, M. E. Published by Frederick J. Drake & Co., Chicago, Ill.

While this book, which contains over 110 pages is built up somewhat on the principles of a catechism, it is very much more, covering as it does the definitions and explanations of many complex questions, and is really more of a book of solid practical instruction regarding all difficult matters in caring for and running successfully an automobile.

Indeed the book seems to be as necessary to the machine for every day use, as the monkey wrench or the screw driver. Not only is it a valuable addition to the chauffeur's outfit, but it should also be a part of the outfit of every man having to do with an automobile. The book is well bound in limp leather covers; finely printed. Price post-paid, $1.00.

WOODCRAFT: for January, is one of the very best issues of this excellent journal, and contains among other interesting and useful matter a brief, but lucid history of the growth and development of wood-working machinery since the introduction of the crude saws, planes and other wood-working contrivances of Bentham, Newberry and others in England, and the Woodward planer and other American improved machines, from the early part of the nineteenth century to the present date.

This historical account of the development of woodworking machinery —connecting as it does the names of the old makers of the last century with the machinery of the present—must prove both interesting and instructive to all operative machine workers of today and a copy of the paper should be in the hands of everyone concerned. Much thanks are certainly due to the editors of Woodcraft for gathering and stringing together so much real history of the woodworking machinery.

This history is illustrated by upwards of 120 reproductions from photos of the old time manufacturers and inventors of woodworking machinery.

CONCRETE WALL FORMS. By A. A. Houghton, author of "Concrete From Sand Moulds," etc. Being No. 1 of a series of practical hand-books on concrete work. The Norman W. Henley Publishing Company, New York. Paper cover. Price 50 cents.

This is a very useful little book, and for its size (62 pages) contains quite a bunch of the very best information on the subject on which it treats. These manuals or hand-books, of which there will be about a dozen, are intended for the use of beginners, and are illustrated in such a manner that any intelligent workman should find no difficulty in following successfully.

CONCRETE FLOORS AND SIDEWALKS. By A. A. Houghton, author of a number of works on concreting and reinforcing, etc., being No. 2 of the series. The Norman W. Henley Publishing Company, New York, N. Y., 63 pp., paper covers. Price 50 cents.

This is No. 2 of this series of hand books, and may be placed on the same footing as No. 1; only, of course, this deals with laying concrete floors and sidewalks, giving quantities of the various materials, also methods of preparing ground or base, and reinforcing, making and laying concrete tiles of various shapes and forms and molds for the purpose. A number of illustrations, drawn to scale, are shown, to assist the workman in his operations. This series of hand-books on concrete work should find its way into the hands of every concrete worker and building contractor.

CEMENT PRODUCTS EXHIBIT AT CHICAGO

The outlook for the success of the Fourth Annual Cement Show in Chicago, February 16-23, is very bright. The show will again be held in the big Coliseum. All the main floor, annex and balcony space has already been disposed of. A new and very beautiful scheme of ceiling and wall decorations has been designed, and the next cement show will undoubtedly surpass in beauty any that has thus far been held. The same general equipment for booths will be installed as was used at the New York Cement Show December last. The corner posts and railings will all be made of cement and the show will be truly a cement show. There will be about two hundred exhibitors.

Inquiries from all parts of the United States, particularly from the territory in the middle west, indicate that the out-of-town attendance will be very heavy. The show comes just at the right time for the contractors who are in the market for machinery for the opening building season.

Two important conventions will be held in connection with the Chicago show. The annual meeting of the National Builders' Supply Association will be held at the Auditorium February 21-22, and the Sixth Annual Convention of the Interstate Cement Tile Manufacturers' Association will be held at the New Southern Hotel, February 21-23.

LATEST LEGAL DECISIONS

Since a provision of a building contract that, if the work was delayed for certain causes, the time fixed for completion should be extended for a period as fixed by the architects if a claim for extension was made to the architects within a certain time, was made for the owner's benefit, he waived it by himself agreeing with the contractor as to the time of extension, so that such extension did not discharge the contractor's surety.—Boppart v. Illinois Surety Co., 126 S. W. (Mo.), 768.

Under Rev. St., 1895, Art. 3301, providing that mechanics' liens shall attach to the improvements for which the materials were furnished in preference to any prior mortgage on the land, but that no mortgage on the land or improvements at the time of the inception of the lien shall be affected thereby, mechanics' liens do not have preference over a prior lien or incumbrance on the land at the inception of the mechanics' liens, and a mechanic's lien is not superior to a prior vendor's lien.—Hubbell v. Texas Southern Railway Company, 126 S. W. (Texas), 313.

Technical or immaterial variations from the strict letter of the contract of a surety for hire will not discharge his obligation, a substantial compliance only being required, and, where a building contract provided for changes in the specifications to be made in a certain manner, that one or two unimportant changes were made therein which were not made as provided by the contract, one being paid for by the owner and the other consisting of two areaways around windows constructed by the contractor to prevent water running into them, would not discharge the contractor's surety, though made without its consent; it not destroying the identity of the contract.—Boppart v. Illinois Surety Company, 126 S. W. (Mo.), 768.

In proceedings by a subcontractor to enforce a mechanic's lien, the contractor is a material party defendant to the bill.—Godfrey Lumber Co. v. Kline, 125 N. W. (Mich.), 682.

If a place is made unsafe in the progress of work, and an employe, injured by reason thereof, participated in the act which caused the accident, he cannot recover.—Lewis v. Gehlen, 122 N. Y. S., 89.

A board of education contracting for the erection of a schoolhouse had a right to pay liens for work and material furnished, and have allowance therefor as for moneys paid upon the contract for the erection of the building.—Goodrich v. Board of Education of Union School District No. 3, of Towns of Greenwich and Easton, 122 N. Y. S., 50.

In an action to foreclose mechanics' liens against moneys due to a contractor upon a contract for building a schoolhouse, brought against the board of education, no personal charge of costs against the members of the board could be made.—Goodrich v. Board of Education of Union School District, No. 3, of Towns of Greenwich and Easton, 122 N. Y. S. 50

The fact that a party furnishing labor or material in the erection of a schoolhouse under a contract with the contractor subsequently became a member of the school board did not deprive him of the full right to enforce his rights for the labor and material furnished.—Goodrich v. Board of Education of Union School District, No. 3, of Towns of Greenwich and Easton, 122 N. Y. S., 50.

Rev. Laws, c. 197, Sec. 6, prescribing the requisites of statement or certificate of lien, does not forbid several from joining in one certificate; and so long as there is a statement by each of several claimants, containing the particulars required, it is sufficient.—De Vingo v. Hall. 91 N. E. (Mass.) 390.

In the accounts of petitioners for liens for labor in a statement under Rev. Laws, c. 197, Sec. 6, the inversion of the names of the petitioners and of the contractors as debtor and creditor was an obvious mistake, and did not invalidate the liens.—De Vingo, v. Hall, 91 N. E. (Mass.) 390.

When work under special contract is done in a cellar, under the dwelling of one who was at the time the owner and occupier, his continued possession of the dwelling and use of the cellar will not necessarily amount to acceptance of the work done.—Merritt & Co. v. Layton, 73 A. (Dela.) 795.

In an action on a contractor's bond for breach of his contract to erect a house for plaintiff, where plaintiff claimed damages for expenses incurred in a lien suit against him for labor and material furnished, he cannot recover any item as costs incurred in that suit that was not taxed or legally taxable as costs.—Sheard v. United States Fidelity & Guaranty Co., 107 P. (Wash.) 1024.

In an action on a contractor's bond for breach of his contract to erect a house for plaintiff, where plaintiff claimed damages for expenses incurred in a lien suit against him for labor and material furnished, he cannot recover costs for resisting a claim for work and material not covered by the contract.—Sheard v. United States Fidelity & Guaranty Co., 107 P. (Wash.) 1024.

A servant, injured by the falling of a platform, struck by a passing train, cannot recover of the master for failure of the railroad company's flagman to give warning of the approach of the train, where there was nothing to show that the flagman was acting for the employer, or in the discharge of any duty intrusted to him by the employer.—Colfred v. New England Structural Co., 91 N. E. (Mass.) 409.

Where an employe helped to remove the support for certain crossbeams in a building, and within an hour and a half was injured by their giving way, he cannot recover on the ground of his employer's negligence in failing to inspect the place in the time between the removal and the injury—Lewis v. Gehlen. 122 N. Y. S., 89.

Where, by a bond, a guaranty company agreed to indemnify plaintiff for any pecuniary loss from the breach of a contract to furnish material and labor, and erect a house for plaintiff, a cause of action on the bond did not accrue until the damages by the breach of the contract were judicially determined and actually paid, and an action on the bond commenced two months after this occurred was not unreasonably delayed.—Sheard v. United States Fidelity & Guaranty Co., 107 P. (Wash.) 1024.

Where a servant knew that the work in which he was engaged was highly dangerous, and he with his fellow workmen put in place the plank which constituted the staging on which he was sitting and the blocks or timbers on which the plank rested, and he knew that if the plank was not high enough the trains passing under it would hit it, and that for his own safety he must see to it that the plank was high enough to clear the trains, he cannot recover on common-law courts.—Colford v. New England Structural Co., 91 N. E. (Mass.) 409.

A note was given by a contractor erecting a schoolhouse to a bank for money advanced to him to pay his employes. The note was authorized by the president of the board of education, and was to be deducted from the next estimate paid the contractor, and the note contained the words that it be charged to the bond account, which consisted of moneys applicable to the payment of the contractor. The next estimate was fully paid to the contractor. Subsequently, the treasurer of the board, who was the cashier of the bank, paid the note out of the bond account. Held, that the authority still remained with the bank after the payment of the first estimate in full to collect the note out of any moneys remaining in the bond account due or to become due the contractor, and its payment was good as against lien claimants who filed their liens subsequently.—Goodrich v. Board of Education of Union School District, No. 3, of Towns of Greenwich and Easton, 122 N. Y. S., 50.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for THE NATIONAL BUILDER by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

974,233. Portable house. R. R. Brewer, St. Louis, Mo.
974,359. Door-opener. C. Cleary, Ironton, Ohio.
974,750. Door. J. B. Clermont, assignor the Yale & Towne Mfg. Co., Stamford, Conn.
974,569. Draft-sill. J. J. Irvin, Bellwood, Pa.
974,673. Flask for building cement walls. J. C. Joslin, Keene, N. H.
974,404. Fire-escape door. L. R. Loughborough, Rochester, N. Y.
974,451. Adjustable hinge. A. Vanderveld, assignor Grand Rapids Show Case Co., Grand Rapids, Mich.
974,542. Support for disappearing doors. A Vanderveld, assignor Grand Rapids Show Case Co., Grand Rapids, Mich.
974,868. Filling-block for fireproof constructions. H. Ericsson, Chicago, Ill.
975,150. Show-window or store-front, D. J. Murnane, St. Louis, Mo.
975,307. Reinforced concrete structure. H. E. White, Youngstown, Ohio, and W. H. Ham, assignors the General Fireproofing Co., New York, N. Y.
974,941. Roof-climber. T. A. Wilkerson, Bonham, Tex.
975,502. End-cut brick-machine. J. Bensing, Malinta, Ohio.
976,029. Sheet-metal pipe. H. Birnbaum, Rapid City, S. D.
976,040. Floor finishing and polishing machine. Wm. O. Canfield, Chattanooga, Tenn.
975,510. Revolving door. Fred Clymer Belmar, and J. Degen, Trenton, N. J., assignors United Revolving Door Co.
975,514. Reinforced-concrete pile or column. R. A. Cummings, Beaver, Pa.
975,615. Cement-mold. R. F. Hanneman, Detroit, Mich.
976,074. Folding scaffold-ladder. H. F. Hartman, Milwaukee, Wis.
975,954. Window cold-air refrigerator. Wm. M. Howland, Eckington, D. C.
976,108. Floor-drain trap. Wm. Weller, Dayton, Ohio.
976,503. Bar spacer and supporter for reinforced concrete. F. H. Schroeder, Jr., Tacoma, Wash.
976,308. Sectional metallic window-frame. W. D. Smith, assignor of one-half to J. M. Triggs, Huntington, Ind.
976,233. Portable folding window-scaffold. J. Volk, St. Louis, Mo.
978,003. Apparatus for making hollow building blocks. F. Burchartz, New York.
977,611. Sheet-metal window. A. Fromhold, Rutherford, N. J.
997,794. Bonding and tie plate for building blocks. Geo. M. Griswold and H. C. Beagley, Kingman, Kans.
978,352. Moisture-proof wood floor. J. W. Brady, St. Louis, Mo.
978,823. Scaffold-support. Eugene M. and D. F. Cavanagh, assignor to New York Scaffolding Co., New York City.

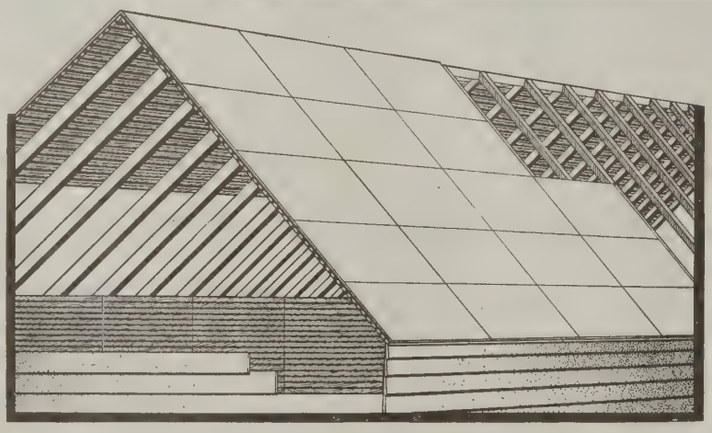
NOTE—While these figures are approximately correct at the time of preparing, the continual fluctuations and shifting of prices make it necessary to advise our readers to consult local price lists when making up tenders.—ED.



NEW USES FOR WALL BOARD.

If ever there was a handy and good material made especially for people of modest means, it is wall board. This does not mean that wall board cannot be used by people of means in building construction, for they have been even quicker to see its advantages and are using large quantities of it, but in introducing a building material into new territory, wall board has certain advantages which gives it a natural market or use for certain purposes. For instance, the architect or contractor might not like to take a chance or believe it the proper material to place in every room of a $50,000 residence, but there would be many rooms or places in that home where wall board could be used to splendid advantage with a little thought.

Contractors and builders have been quick to recognize that wall board gives them a clean, conveniently handled, and money-making material to specify and use. The property owner, on account of the saving in time of construction and in price and because of the different decorative effects that can be had, likes wall board.

The wall board described in this article is used with good results as a foundation for flooring. It is nailed to the joists, protecting the health of the women, as well as the children, who find their greatest pleasure in playing on the floor. It is also used with the best results as a foundation for ready roofing. For this purpose it is nailed to rafters with smooth side of sheathing up. Over this smooth, hard surface, the roofing is easily nailed and is sufficiently strong to hold up anyone walking or standing on it. This combination of wall board and ready roofing keeps out cold and summer heat.

With wall board, therefore, the entire interior of the house may be lined—floors, roof and sides. When the wall board shown here is built for wall protection, it is nailed to outside of studs with lath and asphalt mastic sides exposed to the weather. This leaves a dead air space between laths and boarding, as shown in both illustrations.

This wall board is made of kiln-dried, dressed laths, imbedded in hot asphalt mastic, under pressure of 500 pounds to the square inch, and surfaced with sized cardboards. It is cut at the factory into sheets of uniform size (4x4 ft.) and uniform thickness (3/8 inch). These sheets, which insure a perfectly smooth wall surface, are easily and quickly nailed to studding ready for immediate application of wall paper, burlap or dull coat paints, the latter being the ideal material and the most preferred.

The illustrations shown on this page will explain at a glance the different exterior uses of wall board.

LIQUID MARBLE.

Mr. E. R. Stowell, Portland, Indiana, is offering to sell one formula with instructions in each city or county for making Liquid Marble, which is claimed to be an air drying enamel for cement, plaster, brick, wood or wallboard, to be applied with a brush.

Mr. Stowell states that this Liquid Marble dries hard in a few hours, looks just like marble and is as hard as marble. It is naturally white, but can be made in colors. It can be applied as a flat finish or it can be polished like marble.

It is claimed to be perfectly sanitary, absolutely fireproof and that copper can be fused on this enamel with a blow pipe and not ignite the wood or wallboard.

Mr. Stowell states that Liquid Marble can be made for fifteen cents a gallon, without the use of machinery and no special skill is required. Because it must be made up on the job and should be used within twenty-four hours after it is mixed, the formula and instructions are sold to the builder who wants to use it.

An influential woman member of a fashionable church in Philadelphia had gone to her pastor with the complaint that she was greatly disturbed by one of her neighbors.

"Why," said she, "that man in the pew behind ours destroys all my devotional feelings when he tries to sing. Couldn't you ask him to change his pew?"

The pastor reflected. "Well," said he, at last, "I naturally feel a little delicacy on that score, especially as I should have to give a reason. But I tell you what I might do—I might ask him to join the choir."—Brooklyn Life.

THE EUREKA SPECIAL SCREW DRIVER.

The Decatur Coffin Co., Decatur, Ill., are mailing circulars descriptive of their "Eureka" Special Screw Driver. This screw driver is made in two sizes—No. 1, 14 inches long opened and 9 inches closed, and No. 2, 19 inches long opened and 12 inches closed. "Eureka" Special Screw Drivers are simple in construction, durable, powerful, and very reasonable in price. They can be used as an ordinary screw driver. Just push on the end of the "Eureka" and the screw goes in.

As the Eureka is one of the oldest and best drivers on the market, many hardware dealers carry them.

BERGER'S NEW CATALOGUE.

A new, thoroughly up-to-date catalogue has been issued by the Berger Manufacturing Company of Canton, O. It deals with the products of that concern's steel office furniture department.

Besides being a typical example of high class typographical art, it is clear, concise and succinct. It supersedes all previous editions of catalogues of this company's steel filing devices and office equipment. It contains a wealth of information and is a valuable reference guide to purchasers or prospective purchasers.

The new catalogue shows many new and especially useful combinations, gives dimensions, etc. It well illustrates the progressive steps taken by the Berger company in the steel office furniture department.

ASBESTOS "CENTURY" SHINGLES

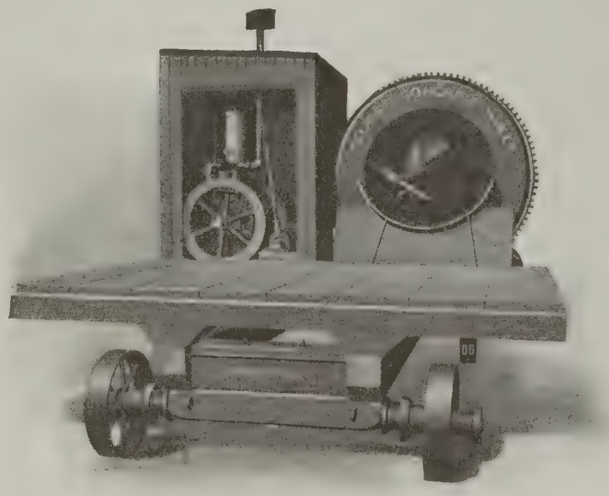
"THE ROOF THAT OUTLIVES THE BUILDING"

Do you know that two hundred million Asbestos "Century" Shingles were used on all types of buildings all over the world during the past twelve months?

In all parts of the United States you will find residences, industrial plants, public and business buildings roofed with these shingles—the Government Buildings, West Hingham, Mass.; the Pabst Stock Farm, Oconomowoc, Wis.; the William Rockefeller Estate, Tarrytown, N. Y.; the Hartman Stock Farm, Columbus, Ohio; Miller Bros., "101 Ranch," Bliss, Okla.; Municipal Water Plant, Columbus, Ohio; Y. M. C. A. Building, Ardmore, Pa.; Plant of the Cleveland Hardware Co., Cleveland, Ohio; Atlantic City Pumping Station, Absecon, N. J.; Power House of the Great Northern Elevator, Devil's Lake, N. D.; High School, Marion, Ill.; Brewster High School, Brewster, Pa.; St. Martin's Parish School, Chicago, Ill.; Office Building of the Will and Baumer Co., Syracuse, N. Y.; Union Passenger Station, Salt Lake City, Utah; St. Vincent's Hospital, Portland, Oregon, etc.

Asbestos "Century" Shingle Roof—Residence of Dr. J. B. Porteous, Atlantic City, N. J.; H. A. Stout, Atlantic City, Architect; Atlantic City Cornice Works, Atlantic City, Roofers.

Asbestos "Century" Shingles are the first practical lightweight roofing of reinforced concrete. You can get these shingles in shapes and sizes to fit any architectural scheme. Three colors—Newport Gray (silver gray), Slate (blue black), and Indian Red. Ask your Roofer for new quotations. Write for Booklet "K. & M. 1911."



The Keasbey & Mattison Company, Factors, Ambler, Pa.

ECLIPSE CONCRETE MIXER.

The Eclipse concrete mixer as illustrated herewith is a machine especially adapted for various classes of work and is at present attracting large attention from the concrete contractors throughout the country. The special features of this machine are the low charging drum which makes it necessary for the charging platform to be only about 24 inches high when the mixer is mounted on truck, and high enough to discharge into wheelbarrows at the discharging side.

This charging platform is mounted on the truck, the mixer is always complete ready for operation as soon as it arrives on the job. The large opening in the charging end of the drum is another advantage because the entire batch can be seen while mixing and it can be determined before discharging that the concrete is in the condition desired. It is not necessary to discharge part of the batch to see whether it is too dry or too wet as often happens with mixers with small openings. The fact that the entire batch can be seen while mixing enables the contractor to produce uniform high-grade concrete insuring good reputation for first-class concrete work which is important. The batch being visible also avoids any loss or damage which is liable to happen if the concrete is not uniformly mixed.

CONCRETE MIXER ON TRUCK WITH GASOLINE ENGINE—REAR DISCHARGE WITH ENGINE BESIDE THE DRUM.

The discharging arrangement on this mixer is semi-automatic in that the discharge door is held in either mixing or discharging position by a strong spring under tension and all that is necessary for the operator to do is to throw this door past the center of the tension in either direction and the spring will complete the movement and hold the door until it is again thrown by the operator. This door can be thrown open for discharging and left open until the entire batch is discharged or as the mixer is made to discharge about 3 cubic feet or one wheelbarrow of concrete per revolution, the door can be closed when a barrow of concrete is discharged and left closed until the next man has placed a wheelbarrow in position when he throws the door securing another wheelbarrow of concrete in one revolution of the drum and closes the door to prevent any more discharging until the next barrow is in position. It is not necessary to have a special man operate the discharge door as the men wheeling can throw the lever without any difficulty whatever. When wheeling the material away in wheelbarrows or when they are discharging the concrete all in one batch the man who is feeding the mixer throws the door by the discharge lever which you will see at the charging end of the drum and for this reason one man less is required to operate the mixer.

From this description the contractor will very readily see that this mixer is very simple to operate.

SHOWING CONCRETE MIXER ON REINFORCED CONCRETE JOB AT CHICAGO.

We have given this description to enable the contractor to determine what can be accomplished by using the Eclipse concrete mixer as the selection of a concrete mixer resolves itself into using a machine so designed and equipped as to put through the greatest amount of uniform thoroughly mixed concrete with the lowest cost for labor and also for repairs which are kept at a minimum when using the Eclipse mixer on account of the simplicity in construction and freedom from complicated charging hoist. While the machine as described would be the ordinary outfit mounted on truck, the Eclipse is built in various styles, capacities and is mounted to suit special conditions, also furnished with hoist for handling the mixed concrete when desired. The mixers are also furnished with either gasoline, steam or electric power. The contractor will appreciate that the materials, cement, sand, gravel and water are constant as to cost and the reduced cost of mixed concrete must be accomplished very largely through the use of an economical mixer that is one that is economical in mixing materials and also in handling materials to and from the machine, hand mixing being too expensive to be used.

One other feature about the Eclipse mixer is that it will operate on either wet or dry mix and with any kind of material. It can also be used for mixing cement mortar or top dressing for sidewalks, the smaller sizes being especially adapted for sidewalk work where a light portable machine is preferable. The Eclipse mixer is manufactured by The Standard Scale & Supply Company, 1345 Wabash avenue, Chicago. They will exhibit at the Cement Show, Chicago, February 17-23, and visitors should not fail to see their display. Those in the concrete business are handicapped unless they investigate the Eclipse concrete mixer. A postal sent to the company will secure full information and testimonials. In writing please mention THE NATIONAL BUILDER.

PEARSON SHINGLE NAILER.

The Pearson Manufacturing Company, Robbinsdale, Minn., call attention to their shingle nailer and to the following letters from satisfied customers:

From Robert Christopherson, Sioux City, Iowa.—"I have one of your Pearson's Improved Nailers and can recommend it very highly."

From John Miller, Wauwatosa, Wis.—"I have received the Nailer some time ago; am well satisfied with it."

From George H. Moore, Chatfield, Minn.—"I have one of your Nailers and I would not do without it. Please find enclosed forty cents for new plunger. I got this Nailer about a year ago."

And from John G. Most, Martland, Neb.—"I would like to get the agency for your Nailing machine at this place. I have the only Nailer in this county and it is one of the best things there is going, I think."

This nailer has been on the market for many years and its usefuness for shingle nailing in both cold and warm weather is evidently fully established.

SEE THE HOOSIER MFG. CO.'S EXHIBIT.

The Hoosier Mfg. Co., Goshen, Indiana, will have an exhibit at the Chicago Cement Show, Booth 276, where they will be glad to meet everyone interested in their Colonial Porch Columns, described in this issue.

These porch column molds have many good features which are well worth inspecting.

A NEW IDEA FOR CONTRACTORS AND BUILDERS.

In the past it has been quite a problem for contractors and builders to reach the prospective builder and to create new business for the future and do it in a dignified and inexpensive way. The use of the Lithograph Postals has at last solved this problem. The contractor, builder or architecture of it, but put it before the home owner just as the building home builder and show him beautiful colored views of the work he is doing.

The lithograph process will not only show the building and the architecture of it, but put before the home owner just as the building appears, when completed with all the natural color effects of both building and grounds.

Every man in the building field will realize the advantages of being able at first to show a client views in colors of what he has built, thus getting the attention of the prospective home builder and standing a better chance of securing the order.

Particulars and samples can be had by addressing the American View Card Makers, 334 Dearborn St., Chicago, Illinois, who are specialists in this line.

IT TELLS ABOUT THE ROOF.

The Cortright Metal Shingle Advocate is out for January and as usual it begins the new volume with a new and very attractive cover design. This little publication, issued by the Cortright Metal Roofing Company of Philadelphia, is devoted to roofing and roofing interest.

It is sent free to any of our subscribers who are interested in these subjects and will take the trouble to drop them a line. Better send a postal today.

THOSE CONTRACTOR-BUILDERS WHO HAVE GRIMM WOODWORKERS SAY THEY CANNOT AFFORD TO BE WITHOUT THEM

NEITHER CAN YOU

THE GRIMM WOODWORKER

ON THE JOB—CUTTING FRAMING

WHAT USERS SAY

RUSTON, LA.

GRIMM MFG. CO.,
Buffalo, N. Y.

Gentlemen:—We beg to state that we are pleased with the Grimm Woodworker beyond our expectations. The fact is we can get out any special work with this machine that goes in a building, and I can't understand, since getting this machine, how contractors can get along without one. We can set up this machine in the building and in nine cases out of ten we can get out material with it in the time it would take us to go and buy it from the lumber yard. Another thing about the Grimm Woodworker is that we can work up everything clean with it. The machine pays for itself in a job or two. It is absolutely indispensable to a contractor who is doing any work.

Yours truly,
[Signed] J. R. RANDOLPH.

We can send you a photographic reproduction of this letter and many others like it.

BURMITE ROOFING AND SIDING APPLIED TO CONCRETE.

We take pleasure in bringing to the attention of our readers a valuable use to which "Burmite" roofing and siding is being successfully put. Since bungalows, factories, warehouses, residences, etc., constructed of concrete, are proving so popular, the next important step quite generally agreed on by architects and contractors, is a suitable covering for the concrete roof, which, if left in its finished condition, is very susceptible to the weather and other agents of a deteriorating nature. It is claimed by the manufacturers, Bermingham & Seaman Company, 1212-1226 Tribune Building, Chicago, Ill., that "Burmite" will meet the most extreme weather conditions and is, therefore, not affected by summers' greatest heat or winters' most rigid cold. It can be applied in the winter as well as in the summer, without danger of buckling, expanding or contracting—a feature which cannot fail to be appreciated by the architect and builder. Among the other qualities claimed for the material are that it requires no painting, is odorless, is easily applied, requiring no expert to lay it, is inexpensive, always remains in a flexible state, and is strong and durable.

"Burmite," it is claimed, is the only material used as a roofing or siding, having a natural permanent color of either slate, red or green, making a very attractive appearance. The slate chips for one and the bird sand covering for the other are imbedded under great pressure through steel rollers in the asphalt. In the center of "Burmite" is imbedded an 8-oz. Calcutta burlap, to give added strength and carefully protected on the top as well as on the bottom by heavy layers of pure asphalt. It is referred to as the only material, except one, having a cement composition between the burlap and the cement base, the felt being thoroughly saturated with pure asphalt and the claim made that it will not dry out. Not only is the material adapted for flat or pitched roofs, but it can be laid over old shingles or tin. Galvanized nails and lap cement with instructions for laying the material are packed in the center of each roll for all package shipments.

APPLICATION OVER CONCRETE.

6

An idea of the appearance of a bungalow roofed with "Burmite" may be had from a glance at the above picture we show, also the application over concrete. For further information and ideas address Bermingham & Seaman Company, 1212-1226 Tribune Building, Chicago, Ill.

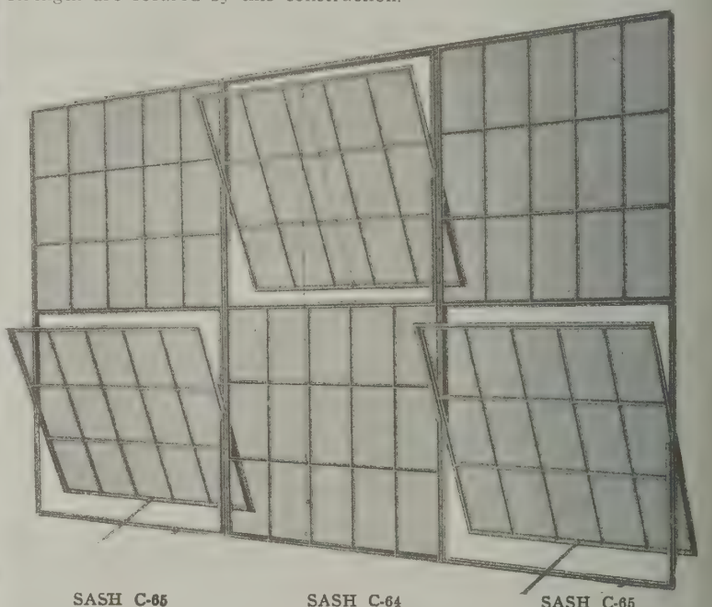
A WONDERFUL WOODWORKING MACHINE FOR CONTRACTORS' USE.

The introduction of the No. 20 Famous Universal Woodworker marks the beginning of a new era in the history of woodworking machinery, as it is safe to state that this machine will revolutionize the entire business. This statement will be better realized and appreciated when the fact is considered that the No. 20 Famous embodies the salient features of sixteen different woodworking machines. In other words contractors can install a complete machine shop by buying the one machine.

The autocratic planing mill, with its charges and vexatious delays will now cease to be the bugbear of the carpenters, builders or contractors' existence, as the wonderful adaptability of the Famous woodworker allows the contractor to do practically all his own millwork upon his own promises, in a fraction of the time, at a fraction of the cost, and without any of the inconveniences attending planing mill service.

The advantages of a universal woodworker—particularly the No. 20 Famous—over individual woodworking machines are apparent to everybody. In the first place is the first cost. It seems incredible that any contractor will buy sixteen machines when he can buy one which will do the work of sixteen. Another point to be considered is the saving in floor space; then there's the saving in power transmission equipment such as belting, shafting, pulleys, motors, etc. Last, but not least, is the saving in labor. But one machinist is required to operate the Famous—and he does not have to be an expert or require any previous experience. The simplicity of construction and absence of complicated parts is assurance against trouble, and makes it one of the most simple woodworking machines to operate. You are requested to write the manufacturers, the Sidney Tool Co., of Sidney, Ohio, for some interesting literature and full particulars.

IMPROVEMENTS IN BUILDING CONSTRUCTION



That public sentiment in the United States is awakening to the folly of the enormous fire losses that have been a heavy tax upon every community, is shown by the activity in the invention and development of fireproof materials.

In this movement for fire prevention the leading materials are steel and concrete, and their application to building construction has engaged the attention of some of the best inventive minds of the day, while capital and business ability, without which the best inventions are fruitless, have been secured in the manufacture and introduction of these improvements.

In the line of improvements in building construction no concern has forged to the front more rapidly nor more successfully than the Trussed Concrete Steel Company of Detroit, manufacturers of the Kahn system of reinforced concrete, and of other products destined to be as favorably well known.

One of the more recent improvements in building construction introduced by the Trussed Concrete Steel Company is their United Steel Sash, a fire retarding product of the greatest strength and rigidity; its transverse strength is so great that twenty-one men have been unpheld by a sash frame of sixteen feet span, while eight men have been balanced upon a single open ventilator in a sash frame.

The illustration shows the application of the United Steel Sash to a bay. It is evident at a glance that the maximum of light, ventilation and strength are secured by this construction.

SASH C-65 SASH C-64 SASH C-65

One of the many typical bays of United Steel Sash made up of three standard units, combined by Standard Mullions.

The United Steel Sash gives the greatest possible resistance to wind pressure and suction; the joints are made weatherproof by the force of powerful pressing; the glass is held firmly by special spring steel clips, easily applied. United Steel Sash are made in standard units combined by mullions to fit openings of any width or height. The units are made in many standard types, such as unventilated sash, sash with ventilators at top or bottom, extending the full width of unit, and sash for monitor and sawtooth roofs. Special sash are made to suit all needs.

The Trussed Concrete Steel Company has just issued a new catalogue of their United Steel Sash which is very comprehensive and will be found useful by all architects, engineers, builders and contractors who will be interested in investigating this invention. It has been used successfully and with the utmost satisfaction in the many important buildings shown by the illustrations in the catalogue. A copy of this catalogue should be in the hands of every progressive builder, and will be sent on request with information of the other novel products of the Trussed Concrete Steel Company. Don't forget to paste THE NATIONAL BUILDER dome on requests for catalogues. "It will help."

THE STAR EXPANSION BOLT CO.

The principal plant of the Star Expansion Bolt Company, located at Bayonne, New Jersey, was almost entirely destroyed by fire early Friday morning, January 20th, the loss to buildings and machinery being almost complete. The stock of manufactured merchandise, however, was but slightly damaged, and they report that they were enabled to resume deliveries without interruption Monday, January 23rd.

The general and executive offices of the concern are located at 147-149 Cedar street, New York, with branch offices and warehouses in Chicago, San Francisco, New Orleans, Montreal, Toronto, Winnipeg.

$1.00 ON A PLANE FOR A DOME.

The Gage Tool Co., Vineland, N. J., are offering to give our readers $1.00 credit on any purchase of their planes, where one of the little NATIONAL BUILDER domes is sent in with the order. These domes are a sort of NATIONAL BUILDER trade mark and are to be found at the bottom of every advertising page. The offer made by the Gage Tool Co. in their advertisement in this number is the first of its kind and makes a real bargain. The buyer of a Gage self-setting plane, by simply sending in a little dome, secures a $1.00 reduction by so doing. The Gage Tool Co. are doing this in order to introduce their well-known planes in new localities and the domes will also tell them which paper the buyer saw the ad. in.

The following description is taken from a circular sent us by the Gage Tool Co.

"The Self-Setting Plane is not like any other plane, having many superior points. It is simple, easier, better. It don't require the "know how" to set it, as other planes do, but can be used by the inexperienced and beginner. It should be in every manual training school, mechanics kit, on every farm, in every home, because all can easily set it and set it right. It is self-setting in every respect; and can be perfectly set for the finest work wthout trouble. Dropping the plane bit and cap into their place sets it exactly right and does it instantly. When properly adjusted, it's hard to set wrong. The cap and cutter may be removed, replaced and accurately set in five seconds, by actual trial; this alone would save every carpenter many days a year spent in trying to set other planes, and saves the beginner the time to learn how to set them. The adjustment is such that the cutting iron may be set square with the face of the plane, even if the cutting-iron is not ground square with itself. The mouth is prevented from wear by being within the adjustable iron throat or bit-holder which extends through the plane and holds the self-setting device.

"The cap is not attached to the cutter, but remains stationary while the cutter is moved up or down. Even while at work, the thickness of a shaving can be changed by a simple movement of the thumb and finger, without breaking the shaving or stopping the plane. A shaving a foot long can be taken with a dozen changes in thickness, all done without removing the plane from the board and without breaking the shaving. This variation of thickness may be made less than one-thousandth or more than one-hundredth of an inch in one second.

"So accurate is the self-setting device that one can take six or more shavings, removing and resetting the cap and cutting-iron after taking each shaving, and the extreme variation of thickness of the six shavings will be less than four-one-thousandth (.4000) of an inch. Can you do this with any other plane?

"This Self-Setting Plane can be changed from a double to a single iron, or from a single to a double iron plane in two seconds. It is adapted to the coarest or the finest work, and will smooth cross-grained, eaty, hard or soft wood, against the grain, working perfectly on both hard and soft wood. Every plane is tested, and ready for use before leaving the factory. This saves the time and trouble spent in fixing so many new planes. If you want to save muscle, time, temper, and do better work, try the Self-Setting Plane.

"Old-fashioned wood-planes can be changed to Self-Setting Planes by any mechanic who has our attachments. Such planes having been seasoned for years, make the best tools.

"We send beech-wood self-setting planes, or attachments for remodeling old planes, on trial where not sold by dealers, on receipt of list price. If, after a thorough test on your own bench, you do not want it, or if for any reason you prefer your money, to the plane, return it at our expense, as sent, within thirty days' of receipt, and we will refund the entire amount sent us. And the trial costs you nothing."

DIEHL NOVELTY 1911 SPECIALTIES.

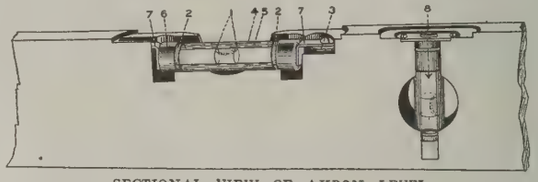
Hinge No. 20 is the hardware specialty that the Diehl Novelty Co., Sheboygan, Wisconsin, are advertising in this number. Like all the other Diehl specialties, this is a well made, easily working hinge. The storm sash hangers No. 1, screen door catch No. 51, basement window hinge, etc., manufactured by this company are all well known, and being carried with the rest of the line by many hardware dealers, can easily be had when asked for. And it is worth asking for the hanger, catch or hinge that you know is right both as to quality and price. If the dealer cannot find these hardware specialties on his shelves, he will be glad to set them for the carpenter or contractor who will tell him about them.

The Diehl Novelty Co. have just added several new things, which it is claimed will make their line a most complete one, and from which the builders can get nearly everything needed in hardware specialties. We are not at liberty now to mention what these new things are, for it is the wish of the company to first have plenty in stock before beginning to advertise them. However, a new catalogue is being printed and will be ready for distribution about March 1st. It always pays to be on the mailing lists of the different building material manufacturers and the Diehl Novelty Co. of Sheboygan, Wis., should be no exception. They will put you on their mailing list upon request.

THE KEYNOTE OF SUCCESS.

A Few Side-Lights on Level-Making, by "The Man from Akron."

A carpenter, mason, concrete worker, or any other craftsman who would attain high rank in his chosen profession must be accurate in every detail of his work.



Absolute accuracy is particularly essential where "plumb" or "level" is concerned. In no other details of building construction are losses of time and money so likely to occur as where careless work is permitted in the "plumbing" of a wall or the "levelling" of a beam.

If the work is to be accurate, good tools must be used. No matter how painstaking the mechanic may be, if his level or plumb is inaccurate, all his efforts are in vain.

There is an old saying that a man is judged by the tools he uses. If this is true, then the man who uses an Akron Eclipse Spirit Level is surely entitled to be considered a first-class workman. These levels have attained world-wide renown for accuracy.

Not only is the Akron Level a marvel of accuracy, but it has many other points of superiority. A glance at the diagram below will show why Akron Levels should be the first choice of every good workman.

The attainment of this remarkable accuracy is due to the employment of workmen who are careful and painstaking in their work. The level maker, to a certain extent, is responsible for the good or bad work of his brother craftsman who uses the level he has produced in building a house or any other kind of constructive work.

SECTIONAL VIEW OF AKRON LEVEL.

1.—"Quicker finder." Two fine silver lines running around spirit tube. The exact width of air bubble is marked by these two lines.
2.—Rubber bearings between spirit tube and outer tube.
3.—Special device for adjusting spirit tube.
4.—Outer tube of heavy steam-gauge tubing.
5.—Spirit tube of clear-as-crystal glass.
6.—Brass caps in which spirit tube is set. Elastic bearings between the two tubes and between outer tube and brass cap insures against breaking.
7.—Suspending arms. Spirit tubes in Akron Levels are suspended in the stock instead of being set as in ordinary level construction.
8.—Plumb.

The "quick finder" is an exclusive feature of Akron Levels. This is obtained by running two fine silver lines around the spirit tube, exactly in the center, so that the workman can tell exact level instantly. Nothing is left to guesswork in the reading of an Akron Level. A man does not need to depend upon his eye to know whether the spirit bubble rests exactly in the center or not. The silver lines relieve him of this responsibility. The "quick finder" is a great help on a cloudy day or when working in a dark corner, particularly for the man whose eye-sight is not as good as it might be.

Another feature that should commend Akron Levels to every careful workman is the superior construction. For instance, the spirit tube is not an ordinary thin glass tube, mounted in an ordinary way, but is made of heavy clear-as-crystal glass and is mounted in an outer tubing of heavy steam-gauge glass. The spirit tube is carried on rubber bearings, so that absolute accuracy is assured at all times, while the double tubing prevents all danger of breaking from the falls and jars incident to daily use.

Akron Levels are made in thirty-three styles and sizes to meet the needs of every workman. Some are made with a plumb in either end in addition to the regular level in center, so that the stock can be applied either end up. The materials used in Akron Levels are the finest money can buy, and the workmanship and finish are above criticism in every detail.

More of the improvements in spirit levels are due to the Akron Level than any other source. The makers of Akron Levels have always led in the effort to produce a more durable and accurate level and a careful study of the situation shows that where other manufacturers have improved their product, it is undoubtedly the result of studying the many improvements in the Akron Level.

Akron Levels are made by The Baker, McMillen Company of Akron, Ohio, who will be glad to mail their interesting catalogue to anyone upon request.

TEST THE AUTOMATIC SASH HOLDER.

The expense of putting in sash weight, the annoyance of breaking cords and ribbons and the cost of repairs may be avoided by the use of the automatic sash holder made by the Automatic Sash Holder Co., 279 Broadway, New York City. The manufacturers claim that the automatic holder is better, cheaper, more convenient, less troublesome, and more reliable, durable and satisfactory than weights. They are the modern remedy for cumbrous sash weights, kinking cords, useless pockets, poor pulleys and balking balances. The automatic saves much time, labor and expense. They prevent rattling and permit the window to be moved both ways easily. They are meeting with much success among architects, contractors and builders, carpenters, sash and planing mills. The automatic sash holder is perfectly adapted for use in new as well as old buildings. For a short time the company will send a sample on request. Could anything be fairer? Better send today.

Simonds Saws

(Si-monds)

Did you ever try the grip and balance of a Simonds Saw?

It makes you feel that you want to use it right away.

The careful process of tempering the special high grade Simonds made crucible steel, the grinding, the shaping, the finishing, does not cover all the painstaking care bestowed in making Simonds Saws.

It's the Simonds way to slight nothing, and in proportion the handles have just as much discriminating care bestowed upon them as the blades—all goes to make a perfect saw. THE SIMONDS SAW.

Your dealer sells you satisfaction when you buy a Simonds Saw—none better, and it is sold the world over. Buy it.

Every carpenter should be sure to write for a free copy of "Guide for Carpenters"

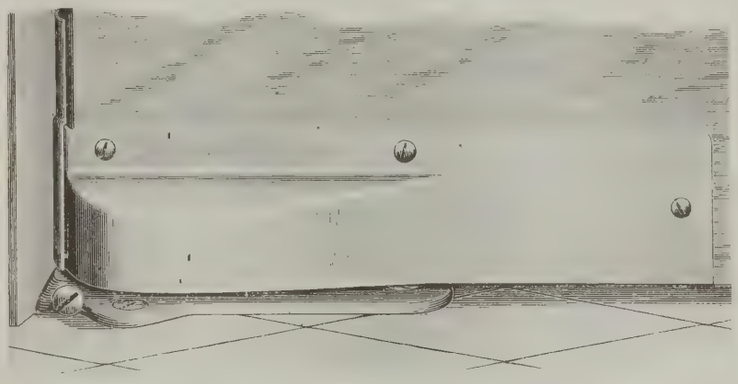
$10.00 FOR 100 WORDS.



The Standard Manufacturing Company, Shelby, Ohio, offered in the January issue of THE NATIONAL BUILDER $10 for a 100 word article descriptive of their Standard Spring Floor Hinge. This offer was made to carpenters and builders and the idea being to get the man who placed the hinges on the doors to tell why he always bought them in preference to others. The article did not have to contain exactly one hundred words. If it only had seventy-five words or even less and gave the best reasons why Standard Spring Floor Hinges were best, the $10 prize would be given for that article, but a limit was placed on 100 words.

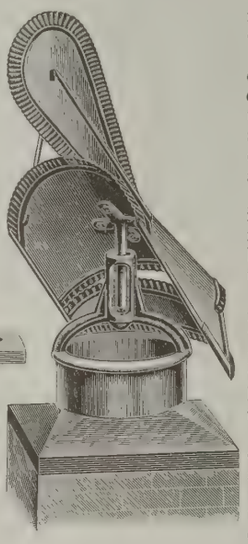
The Standard Manufacturing Company claim that their Standard Spring Floor Hinge controls the door perfectly and allowing it to swing in both directions, smoothly and without noise; that Standard Hinges are positive in action; are adjustable to doors of various weights, holds doors open in either direction and are easily and quickly put on.

Standard Hinges are of all-steel construction. The case-hardened ball-bearings and wearing surfaces not only take care of the weight of the door, but the spring thrust, too. Notice is called to the alignment feature in the door plate. This allows a door to be adjusted to its proper position without changing the position of a single screw. The floor plate is flexible on the hinge post to accommodate itself to uneven floors. Perfect silence in operation is accomplished by means of a short flexible plunger which is not rigidly fixed in the hinge frame, but takes the same side movements as the coil spring.

A hook attachment obviates the necessity of making a finished mortise up the rear edge of the door when attaching the hinge to the door. This feature also allows the weight of the door to increase the strength of the fastening. The finish plates are applied to the surface of the door with wood screws, after the hinge is on. This method covers any defects in cutting the wood in applying.

The two illustrations shown here are so plain that any carpenter or builder can see the many good features claimed for the Standard Hinges, but, of course, the company's circulars will give much fuller particulars and besides that $10 offer for a 100 word article is worth trying for. Ten cents a word is mighty good pay, and besides, the article is not expected to be any brilliant piece of literature. Just plain every-day words, telling why you prefer Standard Hinges to others is all the manufacturers want. The one giving what they consider are the best reasons why Standard Hinges are the best will bring down the $10. All articles must be in by March 15.

ESTIMATING AND PLAN READING TAUGHT.



Realizing the fact that now-a-days a builder-carpenter, bricklayer or foreman must have a good knowledge of drawings and draughting, the St. Lous School of Draughting, 554 Century Bldg., St. Louis, Mo., designed a special builders' course, enabling a working man to spend the dull winter or early spring months profitably in learning how to read blue prints, to lay out all kinds of buildings from blue prints, to prepare plans, specifications and estimates, and special attention being also given to building and general business laws.

February, March and April are often cold, stormy months, and there is, therefore, time left to take this course of special and individual instructions at the St. Louis School of Draughting. On entering this school the student is immediately placed at practical work in the draughting room and at the same time he is given enough theory of design to enable him to master his profession. There is no red tape or unnecessary rules and regulations for the student to remember. He is not expected to recite before a room full of other students—for each student is working out his particular course—and each receives individual attention from the instructor.

IWAN VOLCANO REVOLVING CHIMNEY TOP.

A poor drawing chimney, or shall I say a thoughtless builder, is responsible for many inconveniences in the house.

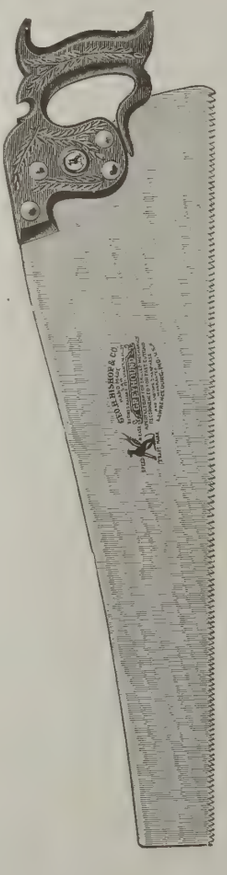
A low chimney placed near a building considerably higher than the chimney itself, or the opening of the chimney being larger than the flue, will cause the chimney in either case to do its worst.

In the first instance the wind descending over the wall of the high building will blow directly into the low chimney. In the second, the first foggy, drizzly day with the heavy atmosphere will act like a blanket over the chimney, and the smoke instead of going out at the opening will back into the house.

These are very unsatisfactory and annoying conditions to the owner and tenant; they reflect on the builder of the house and should be studied carefully and provided against in the early stages.

Some chimneys which in good weather do fairly satisfactory work, will in cold, wet weather with a depressing atmosphere be practically useless, and the failure to heat the house properly gives the occupants ill-health through colds and insufficient ventilation.

These conditions are common and too frequent in houses where the occupants, cannot afford expensive and costly devices to make the building comfortable, and for such as these, and in fact for all houses thus poorly equipped, the Iwan Volcano Revolving Chimney Top is a cheap and effective remedy. It has already cured these identical deficiencies in thousands of chimneys.



In most cases it is advisable to have the tinner construct a galvanized sheet iron base or stack from 3 to 5 feet high to fit the chimney, the upper part being made round to permit of the Volcano Chimney Mounting to be attached. The mountings are made in 6, 7, 8, 9, 10 and 12-inch sizes, and the opening in the stack should be made to correspond with the chimney opening and the size of the chimney top mounting.

The vane keeps the top always with its back to the wind; the wind blowing through the upward sloping opening in the back of the hood creates a partial vacuum at the chimney opening consequenly making a continual upward draft. The sloping opening also serves to blow the ascending smoke away from the chimney opening. Rain or snow are also excluded by the hood.

While the stack and hood if made of galvanized iron will last a few years, it is better if they are made of copper, as they will then last much, longer. Iwan Bros., makers, South Bend, Ind.

GREYHOUND SAW PRIZES.

The Hardware Show—to be held at the Coliseum, Chicago—February 28th to March 4th inclusive should be attended by every carpenter and contractor who wants to see many of the latest tools and builders' hardware specialties.

Geo. H. Bishop & Co., manufacturers of the Greyhound Hand Made Hand Saws, of Lawrenceburg, Indiana, with a branch office at 134 E. Lake street, Chicago, are anxious that all the Chicago readers of the NATIONAL BUILDER see their exhibit of saws, saw clamps, and other specialties. They will furnish 50-cent tickets of admission for 10 cents to our readers who will write, or call at their Chicago branch, 134 E. Lake street, Chicago. This means quite a saving. Besides, by asking your hardware dealer for a card which Geo. H. Bishop & Co. are distributing through their Chicago hardware dealers, you may walk away with a $5.00 set of Greyhound Hand Made Saws. Over five hundred prizes will be distributed among the carpenters and builders who will remember to ask their dealers for the cards Geo. H. Bishop & Co. are handing out through their Chicago hardware dealers.

Besides being able to inspect the entire line of Greyhound Hand Made Hand Saws; see demonstrations made of the new saw clamp No. 750 and stand a good chance at a prize, every carpenter and builder who attends will enjoy the whole hardware show and be benefited by a closer knowledge gained about the different tools, etc., through personal acquaintance with the manufacturers.

So don't overlook getting one of the 50-cent admission tickets for 10 cents, which Geo. H. Bishop & Co. so kindly offer to our readers, not only in Chicago but to any outside builders who may be in Chicago at the time.

ANY of OUR READERS

WISHING TO ATTEND THE

Hardware Show

COLISEUM, CHICAGO

February 28 to March 4, inclusive

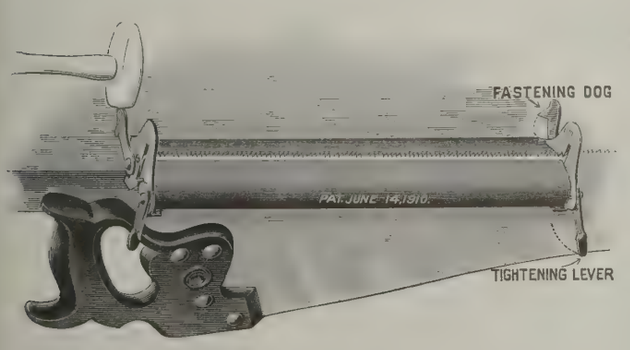
Can Get a 50 Cent Ticket of Admission for 10 CENTS

by calling at the CHICAGO OFFICE of

GEO. H. BISHOP & CO.

134 E. Lake Street

Geo. H. Bishop & Co. will distribute over 500 prizes among the visiting tool users who secure proper tickets of their hardware dealers or at the above address.



Prizes will run from a $5.00 set of Bishop Saws, $3.00 Greyhound Saws, through Bishop & Co. specialties.

EVERY SAW CLAMP USER

Should see our No. 750 Clamp

Weighs 20 ounces. Two blows of a hammer fasten it securely on any wooden support.

Gives an absolutely straight edge and firm grip.

Owners are Specifying, Recommending and Using

Ready-To-Lay

Burmite

(REG. U. S. PAT. OFFICE)

FLEXIBLE-CEMENT-BURLAP INSERTED MATERIAL

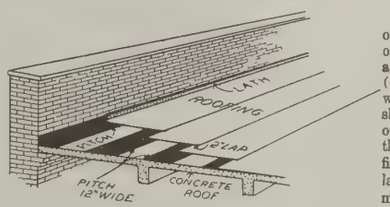
For ROOFING and SIDING

Garages, Bungalows, Summer Homes, Residences, Business and Factory Buildings, Barns, Outbuildings, Churches, Plants, Depots, Etc.,

IT IS BECAUSE *Burmite* HAS BEEN FOUND

The BEST *by* TEST

ARTISTIC and ATTRACTIVE in Appearance—DURABLE and ECONOMICAL, with Superior Fire-Retardative and Storm-Resisting Qualities to meet Extreme Weather Conditions—Sparks, Hail, Sleet, Sliding Ice, Rain, Snow, or the Extremes of COLD and HEAT do not affect the superior Upper Coating of "Burmite," which is made with two Separate and Distinct Surfaces, i. e.,



BIRD-SAND and "*Twolayr*" SLATE-CHIPS

(PATENT PENDING)

For the "*Twolayr*" Slate-Surfaced Material, Colored Slate of Unfading Quality is used, the fine slab-shaped Slate Chips being imbedded into the pure Asphaltum Composition so thoroughly—and put there to stay—that a smooth, even, upper Mineral Surface (there being two layers of Slate Chips) is the result, thus securing the well-known IMPERVIOUSNESS AND WEATHER-RESISTING QUALITIES OF SLATE AT ONE-FOURTH THE COST.

The RESISTING QUALITIES of our Slate-Surfaced Material are such that it is especially recommended for, and is being largely used as a Roofing on PULP MILLS, CHEMICAL WORKS, ACID and FERTILIZER PLANTS, and other buildings used for like purposes, where the roofs are affected by Acids, Gases or Fumes.

APPLICATION OVER CONCRETE.

There are several methods of applying our material over concrete surfaces. The one in general use (see illustration) is to first apply a mixture of tar and pitch at the joints (consistency of same depending upon the weather) 12 in. wide and the length of the sheet. Place the material over these bands of pitch, lapping sheets 2 in. and cementing the joints with lap cement. Press down firmly so that the material will stick and lay smoothly. No nails are used when the material is applied over Concrete.

2 Permanent Natural Slate Colors—SLATE-RED and "Stoddard" SLATE-GREEN

UNIFORM SOLID SLATE Surface. Requires no Painting. Kept Clean and Bright by the Rain.

GUARANTEED FOR 10 YEARS WITHOUT COATING.

THE FIRST COST—THE ONLY EXPENSE. Sold on its Merits and Lasting Qualities.

As a rule, other grades must be coated at least three times in from seven to ten years; and if the cost of paint and labor is added to the original cost of Material and applying it will be at once apparent that "Burmite" is not only the most LASTING, and INEXPENSIVE, but more PRACTICAL THAN OTHERS.

To make yourself acquainted with this up-to-date Material for Roofing and Siding Buildings of Concrete, Brick, Stone, Wood, or other construction, WRITE TODAY for our SAMPLES and BOOKLET,

"BURMITE QUALITY COUNTS"

Illustrated with buildings, beautifully printed in colors, showing effect of BURMITE MATERIAL applied as a Roofing and Siding, mailed free of all charges and obligations.

THE DISSTON TRADE CONFERENCES.

An informal banquet was given early in January by Henry Disston & Sons to representatives of the big saw and tool-making concern, who went to Philadelhpia from all parts of the Union and from Canada to attend a series of trade conferences.

Besides the corps of salesmen, there was present at the banquet a large number of saw experts who spend their time in lumber camps and sawing centers to aid millmen in any and every way that their experience and knowledge enables them to render assistance.

All the executive departments of the great home organizations were also represented at the banquet.

It is the general sentiment of all Disston salesmen and representatives that the next twelve months will be the best selling year of their experience despite the fact that 1910 was a record breaker.

Business reports brought in from every section of the United States are optimistic, and men who are in the closest possible touch with actual conditions are confident of boom trade for the lines they represent.

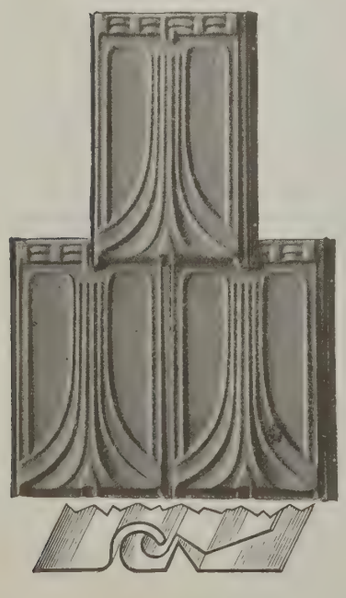
One of the western salesmen said: "Mr. Toastmaster, I want to say that I am proud to be in the Disston employ. It is an honor to be associated with this management and to have the privilege of selling Disston goods. I have had no difficulty whatever in obtaining and maintaining our full share of the business in my section, and this by reason of the well known high quality and efficiency of the Disston goods. The future looks even brighter than the past. The treatment accorded us by the management makes us loyal to the core and we shall ever stand by the house of Disston and its goods. In saying this, I know I am echoing the sentiment of everybody here."

During the week all representatives have made careful study of the manufacturing processes and executive policies of the great plant in Tacony. Officers of the company have spared no effort to thoroughly acquaint their men with the principles, purposes and ideals of the great organization of which they are a part.

Mr. Robert J. Johnson, second vice president, acted as toastmaster at the banquet.

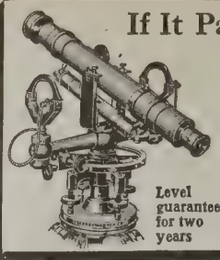
With Mr. Johnson at the head of the table were Mr. William Miller, secretary; Frank Gould, manager of shelf goods, and E. F. Cooper, manager of the mill goods department.

The toastmaster called upon some thirty of those present for responses to toasts appropriate and of interest to the occasion. These represented all sections of the country and evidenced the widespread demand for the Disston saws and tools.



CIRCLE SWING DERRICKS.

Sasgen Bros., 2053-57 Racine avenue, Chicago, Ill., are mailing circulars descriptive of their Circle Swing, "Pole A," frame and setter derricks. These derricks are designed to lift loads with the least exertion—do it quickly and with perfect safety to the workman on the building, the men below and the material being hoisted. Every derrick that leaves Sasgen Bros.' factory is carefully made of high class materials, and the fact that Sasgen derricks are now found in use wherever there is building going on, speaks decisively for the satisfaction they are giving.



It's a good plan for the contractor to order his equipment before he really needs it. Very often building operations start in much earlier than expected and the contractor finds himself trying to keep up with his work with the same old knotted ropes and creaky pulleys, even after he had sworn never to go through another year without a good outfit. Sasgen Derricks make the job of hoisting so much easier and handier for the men that they work faster, and being in better humor, things go along smoothly and with a rush that saves time and money for the contractor.

The Circle Swing Derrick which Sasgen Bros. have been advertising for $36.00, all complete ready for use, is said to be an unusually good one and a derrick which is not only very reasonable in price, but unusually well made. The Sasgen Pole "A" Frame and Setter Derricks are described fully in circulars issued by Sasgen Bros. and these circulars can be had for the asking.

EDWARD'S "AJAX" METAL SHINGLES.

In the January number of the NATIONAL BUILDER mention was made of the Ajax Interlocking Shingles, the new product of the Edwards Manufacturing Company, 430-450 Eggleston avenue, Cincinnati, O. Unfortunately, the cut was printed upside down, which tended to give a wrong impression of these handsome interlocking shingles. Examination of the accompanying cut will show how the shingles look and how they interlock. The lock provides automatically for expansion and contraction, securing tight joints which rain and snow cannot penetrate. To be sure that you get these improved shingles, specify Edwards "Ajax" Loose Lock Shingles and insist on having them. Remember to mention the NATIONAL BUILDER.

If It Pays Over 1,000 Contractors to Use Convertible Builders' Levels

CORTRIGHT METAL SHINGLES SELLING TALK No 10

NO RAIN OR SNOW CAN GET UP UNDER HERE

See where I'm pointing?

It's absolutely impossible for any snow or rain to beat in under either the tops or sides of

CORTRIGHT METAL SHINGLES

It is equally impossible to lay two shingles with flat surfaces like wood, slate, etc., one on top of the other without leaving space enough for both rain and snow to penetrate.

For instance, wood shingles, in 9 cases out of 10, split right down the center first, and that is just where the joint of the two overlapping shingles comes.

What's the answer? An immediate leak of course.

Now just stop and consider that Cortright Metal Shingles are joined on the sides by an absolutely waterproof side-lock and protected at the top and bottom by an overlap equally impenetrable.

By this means you see we get just as tight a roof as though it was covered with one solid sheet of tin.

Now if Cortright Metal Shingles are going to make you money now's the time you want to find it out.

If they will make you money you're losing every day you delay investigation of them.

Why don't you find out? We print two good sized books just to help you and the only reason we haven't sent them to you is—you haven't sent us your name.

That's why we've attached the coupon. Sign it right now

¶ This is one of a series of Selling Talks published to help you make more profit through Cortright Metal Shingles. Next month's talk will tell why Cortrights are fireproof.

NEVER LEAK METAL SHINGLES.

The Tiffin Art Metal Company, Tiffin, O., claim to produce the most perfect metal shingle on the market. This is a broad statement which the manufacturers say is but the opinion daily reaching them from builders and contractors of long experience and critical viewpoint. The reports come from many states and refer to all classes of buildings. The shingles are of galvanized iron, I. C. & I. roofing tin and are so carefully made in one of the newest and best plants that their appearance is surely attractive. The clear advantages of metal shingles needs no explanation. The chief question which always interests the builder and contractor, whose reputation for "knowing how" and using only dependable building materials, is where he can be sure of getting goods of highest quality, promptly shipped and at a minimum price.

This company has gotten down the cost of production to a fine point. The plant, while extensive, carries but light overhead expenses, and, as their ideas of a manufacturing profit are modest, their prices ought to be attractive to the prudent buyer. The Tiffin Art Metal Company are also makers of many splendid lines of metal ceilings, combining some special features of value to all contractors and builders. It is not strange that their products have met with the instant approval of the trade and it would doubtless pay the enterprising builder to correspond with them and get the exclusive contract of their goods in certain sections.

The buyers who have tested Tiffin products say that they are right in all respects, the makers admit that this is true, hence the NATIONAL BUILDER records the facts as brought in evidence.

BIG STEEL MILL FINISHED.

One of the Biggest Moves Ever Made by the Manufacturers of Simonds Saws.

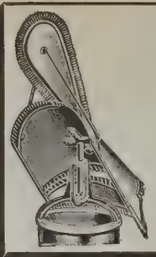
A complete new steel mill for Simonds Saws has been built and is now in operation at Lockport, N. Y. The steel making part of the Simonds Manufacturing Company's Chicago factory was entirely too small to meet the constantly growing demands for Simonds Saw Steel.

The problem has to be met. It was a question of more steel; consequently plans were at once made for a new mill. Lockport, N. Y., was selected as the location. Work on construction began early last summer. The first steel was rolled Monday, January 2d.

At Lockport there is a separate rolling mill for band saw plates, cross-cut saw plates and circular saw plates. Ample room is also provided for plates for Simonds hand saws and steel specialties.

One general building is located adjacent to the ends of the rolling mills for the making of steel ingots.

A considerable proportion of the iron used is the famous Dannemora iron imported direct from Sweden, on which there is a high duty. Nothing that bears the name of "Simonds" has ever been made from anything but the very best of materials and in a crucible furnace.



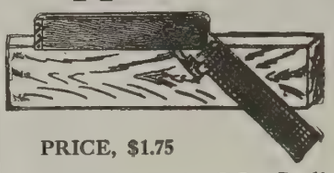
Uniformity is Simonds constant watchword. To make sure of this desired uniformity, careful chemical analysis is made on every heat turned out of the mill. The physical properties of the steel are also tested out. We know of no other steel mill in the United States that is so thorough as the Simonds Lockport mill in the testing of steel.

A modern gas producing plant is in operation next to the crucible furnace building and there is produced the great amount of gas used in the furnaces.

The machinery of the Lockport mill is thoroughly modern. All that is latest and most up-to-date in scientific crucible steel making is made use of here. New machinery and new methods enable them at once to double their former steel production. Direct from Niagara Falls to the Simonds steel mills, high voltage wires carry current sufficient for four thousand horse-power, and an electric plant of no mean size is required to house the transformers and necessary switch boards.

At the entrance to the grounds at Lockport, a substantial two-story brick building has been built to accommodate the office force and the laboratory. The laboratory has always been one of the chief points of interest around Simonds steel mills, as experts make careful tests of every lot of steel produced for saws that bear the name Simonds.

For passenger traffic an electric line has half-hour fast service direct to Buffalo. All trains stop at the Simonds station. The New York Central railroad has freight connections with the Simonds private switch track, which has four spurs, running right into the buildings of the steel mill, so that raw material may be unloaded and finished plates shipped with the least possible delay.



The Chimneys Most Frequently having no draft or a very poor draft are those situated on a low building next to a higher one.

The remedy and a very sure one, is a Volcano Revolving Chimney Top. We know it, as we have proved it, and thousands of others have proved it.

Sizes, 6 to 12 inches in diameter. Write for catalogue now.

Send Coupon Now For Free Samples of Johnson's Artistic Wood Finishes

EVERY practical contractor and builder can better his work, better his profits and better his reputation by using Johnson's Wood Finishes. You can prove this at our expense—it will cost you nothing—save you much. We want to send you free working samples and Johnson's Illustrated Color Book—"The Proper Treatment for Floors, Woodwork and Furniture"—giving complete directions for their use. We want every contractor and builder to accept this free offer. Mail coupon or postal today.

Johnson's Wood Dye

is not a mere surface stain—but a deep-seated dye, penetrating the wood and fixing a deep, rich, permanent color entirely different from ordinary stains, which are only skin-deep.

Made in fourteen attractive shades.

When used in combination with Johnson's Prepared Wax or Johnson's Under-Lac, inexpensive soft woods such as pine, fir and cypress may be made as beautiful and artistic as costly hard woods.

Ask your dealer for free samples and prove it for yourself.

Johnson's Under-Lac

A spirit finish vastly superior to shellac and varnish—not thick, sticky and slow drying like varnish, neither does it dry too quickly like shellac. Under-Lac should be used over Johnson's Wood Dye and Paste Wood Filler where a higher gloss than a waxed finish is desired.

For a first-coater, where varnish is to be used, Under-Lac is unsurpassed—one coat of Under-Lac and one coat of varnish will give a better finish than three coats of varnish without the Under-Lac.

Under-Lac is particulary adapted for finishing linoleum and oil cloth—dries hard so the floor may be walked on in an hour.

Ask your dealer for free samples and convince yourself of the merit of Johnson's Under-Lac. Gallons $2.50

Johnson's Color Panels and Illustrated Book

Let us send you free a complete set of wood panels showing all shades of Johnson's Wood Dye on various woods. These panels are conveniently put up so that you can easily show them to prospective customers—by doing so we are sure you will procure many contracts at profitable prices for work to be finished with Johnson's Artistic Wood Finishes. The dye *always* matches the panels.

We will also send you a copy of our new book illustrated in many colors and containing color plates of the dye. This book gives full instructions for finishing and refinishing all wood—soft and hard. It is invaluable. Present the attached coupon to your leading paint dealer for samples, wood panels and book. Or mail coupon to us giving dealer's name and we will send them to you from Racine.

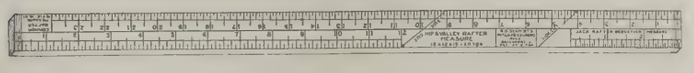
THE C. H. & E. LINE.

The C. H. & E. portable saw rig is the machine which is doing a lot of millwork for busy contractors, and doing it on the job and doing it in first class shape. The rig is very strong and rigid and will stand the very hardest of usage. It has the reputation among its users of being a complete and economical operating mill. It requires no line shafts and takes up very little floor space. It is always ready to do sawing and one crank of the engine fly wheel makes it run, the three-horse power engine pulling the saw with ease. The C. H. & E. Mfg. Co. claim that over two years were spent in getting this rig to balance perfectly and that there is a total absence of vibration when in operation.

The cylinder and frame of the engine is cast in one piece of special grey iron, making it very rigid. The piston is grey iron, accurately machined and fitted with three spring packing rings. The connecting rod is made of malleable iron which insures it against breaking. The crank end of same is lined with Parsons' White Brass, which is the highest priced bearing metal on the market. Crankshaft is high carbon drop forged steel. The main bearings are genuine babbitt metal and the studs are fitted with double check nuts, insuring safety. Igniter, Jump Spark, high grade plugs and coils are furnished. Governor, hit and miss type; bore, 3¾ inches; stroke, 4¾ inches. Revolutions, 500 to 600. The weight of the engine complete is 350 pounds and cannot freeze or overheat.



The C. H. & E. Mfg. Company is located at 321 Mineral street, Milwaukee, Wis. Their No. 2 all iron saw rig and their 1,000 pound capacity builders' hoist are fully and attractively described in illustrated folders, which will be mailed on request.

SCHMIDT'S PITCH MEASURING RULE.

Schmidt's Pitch Measuring Rule is a rule for measuring and laying off rafters of certain pitch. It is made of hard maple wood ⅜-inch thick, 1⅜-inch wide and three feet long. It has brass tips on the ends and is finely finished.

Mr. Schmidt states as follows in his circular regarding his rule:

"If a roof has hips and valleys, the best way to frame rafters is to make a roof draft to go by. It does not require a fine drawing. A line on the outside of the building and the measurements thereof, and a line of every rafter and ridge board, such as the dash lines shown in the circular drawing. This will give you the number of rafters required, the side cuts there are to be made on the jack rafters and also on the hips and valleys, and by a little figuring you can get the run of them all. Mark how many feet and inches there is in the run of every rafter and ridge board. When you know the run of the rafters, it is a simple matter to frame them with a pitch measuring rule. It gives every inch, every half, quarter and eighth of an inch there is in the run of a rafter on this rule, common rafter or hip and valley rafter.

The common rafter that has a run of 5 feet ¾ inch, or 6 feet 1 inch, and the hip rafter that has a run of 3 feet 11¼ inch, or 2 feet 11 inch, is just as easy to get the length of with this rule as if they had an even number of feet in the run and just as easy as if you were to measure off a joist of that many feet and inches with your every day rule.

It gives the correct side cuts of the hip and valley rafters, and also of the jack rafters; how much to deduct from the jack rafters to allow for the thickness of the hip and valley rafters; how much to allow for the thickness of the ridge board on common rafters and also on the hips and valleys; how much to let extend over the plate to allow for the cornice, either common rafters or hips and valleys. It gives all of this to a fraction of an inch.

There is no setting to do to this rule, one side of it can only be used for a certain pitch roof. No figuring after you know the run of the rafters, but it gives you all you want to know except the plumb and bevel cuts, those you will have to get with a square, otherwise the square is not needed at all. Measure the ridge board with your every day rule, and measure the rafters in a like manner with a pitch measuring rule, and the rafters will all be right and fit in their proper places, providing the building is square. If a building is not square, no hip rafters will fit even if they are cut right.

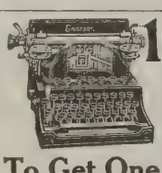
If a building is out of square and has hips and valleys, find out by measuring from corner to corner or along the hip or valley run with a tape line, then divide the difference by four and cut the two on the short run that much shorter and the two on the long run that much longer, and the rest of the rafters will fit all right.

Getting rafters not just right is where the trouble comes when you come to put them up, and this is where the time is lost, when you have to cut them again.

It is easy to frame all the rafters on the ground if you make draft of the roof and use a pitch measuring rule. You can get eve rafter and get it right.

Mr. Schmidt claims that his rule will last a life-time and th there is no better rule or tool made for roof framing. It is the si plest thing out and any carpenter can frame rafters with his ru His circulars are so plainly written and his rule so simple that seems well worth while to order one and save both time and mon Address, R. D. Schmidt, 738 W. Fourteenth street, Davenport, Iow

KEYLESS LOCKS FOR DOORS.



It is as easy as it looks to touch one or more of those lit projections on the side of t lock, and the door is instan opened. Besides being a prot tion against burglars, and a gr convenience in many other wa the Dayton Keyless Locks finely made and finished and a an ornament to any outside do

The Dayton Keyless Locks be easily opened by a child. the same time, the most exp lock man who did not know t combination, would be unable figure it out. There is no ma of combination figures to be membered. There are no keys carry around or be left about.

The Dayton Keyless Lock 804 W. B. building, Dayton, Oh are selling their locks large through agents, and some of th best agents are contractors a carpenters, who, being well a favorably known to the proper owners, are in a position to recommend them, and put them on doors. Many letters are received by the Dayton Keyless Lock Co pany from satisfied customers all over the country, along the lin of the following communication from Dr. W. A. Kaake, a well know dentist of Duluth, Minn.:

"The locks you sent me are certainly very fine and more th make good all that you claim for them. Many who have seen the operate, and the locks do in a way that seems to indicate intelligen are anxious to have a lock or two on their homes. Others desire act as state or local representatives for you. We have tried the loc thoroughly and to say that we are well pleased is to put it ve mildly."

Circulars fully describing these wonderful locks can be had request. And, if you want the agency for your town, ask for pa ticulars.

Amatite ROOFING

Buy It—and You'll Never Need Roof Paint

When a man is under the necessity of ing a lot of roofing, he is pretty sure to udy the subject with great care. That is ny Amatite is so often used on the big ready ofing contracts. A man who has only a w hundred feet of roof will often be careless his choice of roofing, but when it comes thousands of square feet (as above), matite is sure to be used.

The following is a typical instance:

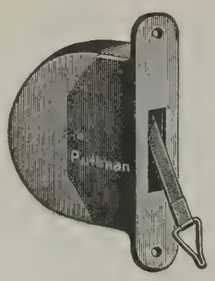
Waterbury, Conn.,
Nov. 19th, 1909.

rett Manufacturing Company:

DEAR SIRS:—We wish to inform you that the "Amatite" ofing which we have used on our office, storehouse, lumber d and barn has given most satisfactory service. The area these roofs cover is about 15,000 square feet. The roofing nusually attractive in appearance, and in our judgment is the most durable and satisfactory made. The fact that it requires no painting appeals to us very strongly, and this feature makes it by far the cheapest ready roofing on the market.

Yours truly,
CITY LUMBER & COAL COMPANY.
[Signed] F. B. Boardman, Treasurer.

The economy of Amatite is not only in its durability and its price (lower than any other mineral surfaced ready roofing on the market), but also in the fact that *it requires no painting.*



You may be sure it would cost something to paint their big roofs if they used a roofing that needed painting. All that is saved with Amatite.

A sample of Amatite and further information will be sent you for inspection, free, if you will send name to the nearest Barrett office at once.

"On The Level" Talk

By the Man from Akron

"HERE, gentlemen is the best spirit level ever made—the only level that completely and perfectly fills the bill. It is the standard of accuracy to which others are compared. No other level has those clear, distinct Silver Lines which show L-E-V-E-L, or otherwise, instantly, and can be seen at a considerable distance. No other level is so scientifically accurate, or so well adapted to every use that a level can be put to.

Akron Eclipse Levels

Notice the construction. The spirit glass is carried on perfectly adjusted elastic bearings and enclosed in a heavy glass tube which is practically unbreakable. Thus it will endure the falls and jars incident to daily use, without injury. This is the level that introduced the idea of using two plumbs, so that stock can be applied either end up. All glasses are adjustable so that accuracy is assured under all conditions. Akron Eclipse Levels are made in 33 styles and sizes for carpenters, masons, concrete men and everybody who uses a level.

And yet, with all the big advantages possessed by Akron Eclipse Levels, they cost no more than the ordinary kind.

Sold by Hardware Dealers Everywhere

If your dealer does not sell Akron Eclipse Levels, write us for catalog, mentioning dealer's name. You want the best level that money can buy, so find out about Akron Eclipse Levels before you purchase. Write us today. A postal will do.

See those 2 lines around spirit tube?

This quick "finder" shows L-E-V-E-L or otherwise, instantly

The Beginning of His Success

Success has dawned for many a man with the marking of the I. C. S. coupon. It was a simple act—an act that placed him under no obligation—but it proved to be the beginning of a career.

Trained men are in demand everywhere. There is not an important labor-employing concern in the world that has not openings for men prepared to make good in positions. "We always need trained men," said a prominent manufacturer recently to a young man applying for a position. "There are not well-trained men enough to meet the smallest part of the demand," declared a leading magazine in a strong editorial. The Help Wanted columns of trade papers teem with advertisements for trained men.

Draftsmen are wanted. Can you trace out a machine or a building? Foremen and Superintendents are wanted. Can you plan and direct work? Chemists are wanted. Can you make an analysis or build up a useful compound? Trained Electricians are wanted. Would it be safe to turn you loose in an electric plant? Civil, Mechanical, and Mining Engineers are wanted. What does that mean to you? Advertising men are wanted. Can you write a business-pulling ad? The Civil Service needs men. Are you prepared to pass a Civil Service examination?

The marking and mailing of an I. C. S. coupon has been the beginning of success for thousands. Why not find out about the I. C. S. plan? It will place you under no obligation whatever but will bring to you a full explanation of the I. C. S. salary-raising system that has been used by thousands to change poor jobs into good positions and "wages" into salaries.

Mark and mail the coupon NOW.

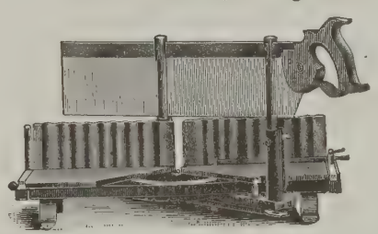
Extension Bit Holder, No. 5

It has been found very difficult to make a strong and adequate bit extension of a dimension so contracted as to follow a ⅝ inch bit into a hole, without either breaking the chuck through its weakness, or losing the bit in the hole being bored. As these extensions are used largely for boring between partitions, such results may be rather disastrous through the loss of the bit in the partition, or marring the grace of the structure into which the hole is bored. The chuck to No. 5 is a little less than ⅝ inch in diameter, so will follow a bit of that size. The four jaws are made in one piece from steel, and are exceedingly strong and so constructed that the square corners of the bit shank will go between them, holding them very rigidly. This extension is durable and capable of performing all that can reasonably be expected of it. The tool is most useful to electricians and plumbers.



Price, in lengths of 12, 15, 18 and 21 inches, each $1.50

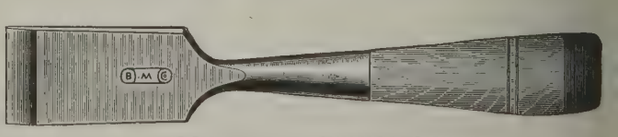
We guarantee that our chisels will hold their edge all day with one sharpening, even if used on quartered oak across the grain.



Chisels look simple, but there is no tool of which such hard work and varied service is required. Recognizing this we have given the choice of the steel, regardless of cost, and the design of these chisels, the most extensive study and experimentation, and in their manufacture the greatest care and highest order of skill is employed.

SPECIAL OFFER

To further increase the number of carpenters who insist on having B. M. Co. Chisels we will sell direct to readers of the National Builder, express prepaid, any chisel or set of chisels **with privilege of returning after ten days trial if they do not prove to be the BEST EVER USED.**

44 AND 46 CADILLAC SQUARE DETROIT, MICHIGAN

Diehl's Separable and Reversible Hinge No. 20

This hinge is designed for storm and screen doors. The door may be swung at right angles and lifted from its bearings without removing the screws, as the shank slides through the small slot in the upper ear so that it makes it very easy to change from storm to screen doors and from screen to storm doors without removing the hinges. Hinge No. 20 is made of open hearth wrought steel, 14 gauge, and finished in black baked japan or oxidized copper.

A Sample Set of Hinges will be sent upon receipt of 25 cents in stamps.

The Diehl Novelty Company SHEBOYGAN, WISCONSIN

Mention National Builder.

"That Coupon Gave Me MY Start"

"It's only a little while ago that I was just where you are now. My work was unpleasant; my pay was small. I had my mother to take care of, and it was tough sledding trying to make ends meet. I hadn't had much schooling. I didn't *know enough* to fill any better job than the one I had.

"One day I saw an advertisement of the American School. It told how other men got better positions and bigger salaries by taking their courses. I didn't see how a correspondence course could benefit me, but as long as it didn't *cost* anything to mark the coupon I thought it was worth investigating at least. I marked the coupon and sent it in on the next mail.

"That was two years ago last April, and now I'm drawing more every week than I used to get in a month."

If YOU want a better position, if YOU want to get into congenial work, if YOU want a salary that's worth while—

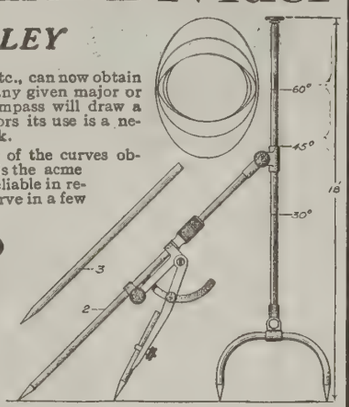
A good pencil is as necessary to an expert carpenter as good tools. That's the reason the makers of the best complete line of tools also send to the craftsmen the best pencil—

E. C. S.
Carpenter Pencils

They "hold their edge"—are tough and durable—work smoothly. The graphite is best quality—no hard spots—no grit.



If not at your dealer's write to us and we will send free sample and tell you where to get them.

SIMMONS HARDWARE COMPANY (Div. No. N. B.,) St. Louis and New York, U. S. A.

A Wonderful New Ellipsograph and Divider
—called the KELLEY

Draftsmen, Pattern-makers, Mechanics, etc., can now obtain an instrument which will draw an ellipse of any given major or minor axis, just as readily as an ordinary compass will draw a circle. For carpenters, builders and contractors its use is a necessity for saving time and doing perfect work.

Illustration shows the machine and a few of the curves obtainable with the KELLEY Ellipsograph. It is the acme of simplicity in operation and is absolutely reliable in results. It can be adjusted for any ellipse or curve in a few seconds and is readily understood by anyone.

Price Complete $3.00

We positively guarantee satisfaction. Send $3.00 for this unique instrument and we will send one by return and pay charges. It will pay for itself in a saving of time, labor and worry.

J. T. KELLEY

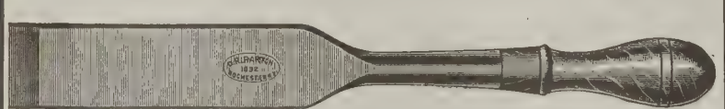
STANDARD HANDBOOK OF ESTIMATING DATA
Every man in the building trade needs it.

READ WHAT OTHERS SAY:



It is a very handy book, not only valuable but comprehensive.
I think it the nearest correct, and the shortest cut to business, the busy man has yet found.
It fills a place that has been wanted for years.
Your Standard Handbook is the best book of its kind ever written.
For all the 30 years I have spent in estimating and building I would not be without it for twice the cost.
Just what I want and well worth the money. Thank you for calling my attention to it.

PRICE, ONE DOLLAR

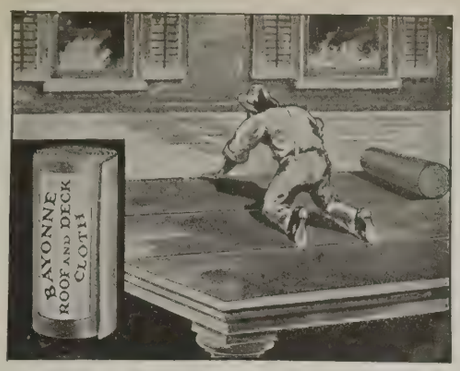
GREYHOUND HAND SAWS

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the **best** for your use, you get your money back.



Order one today and let us take all the risk. If you want literature first, write us.

GENASCO — THE STANDARD OF EXCELLENCE — TRADE MARK

A roof is only as good as its waterproofing.

Knowing this, will you buy the covering for *your* roof on its "looks" alone, and not know what it is made of?

Genasco

the Trinidad-Lake-Asphalt Roofing

is waterproofed entirely with *natural* asphalt. In Trinidad Lake this asphalt has resisted blazing sun and terrific storms for hundreds of years. It has natural oils that give it lasting life in a roof despite the buffeting of rain, snow, sun, wind, heat, cold and fire.

Man has tried to *make* lasting waterproofers—and always failed. Ordinary ready roofings show you what happens. They are made of mysterious "compositions" or coal tar; and they soon crack, break, leak and go to pieces. Yet as for looks they are mighty good imitations.

It pays to know about waterproofing when you buy roofing; it is a waste of money *not* to know.

The life and backbone of Genasco is Trinidad Lake Asphalt—the *natural* everlasting waterproofer—and that makes Genasco last.

Genasco is made with mineral and smooth surfaces. Guaranteed, of course.

The Kant-Leak Kleet waterproofs the seams of roofing thoroughly without the use of smeary unsightly cement, avoids nail-leaks, and gives the roof an attractive appearance.

Ask your dealer for Genasco Roofing, with Kant-Leak Kleets packed in the roll. Write us for the Good Roof Guide Book and samples.

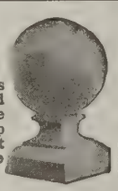
MIRACLE CONCRETE



MIRACLE MOLDS

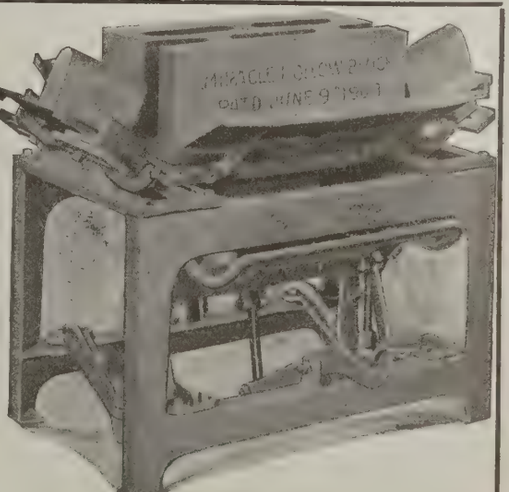
have revolutionized pipe making. Cement pipe can be made for one-third the cost of clay.

24" concrete pipe costs 35c per foot to make.
24" clay pipe sells for $1.25 per foot.
An outfit for making 24" cement pipe costs $50.00, other sizes in proportion.
Every size profitable.

ORNAMENTAL CONCRETE

Molds for Lawn Vases, porch columns and balusters—also fence decorations, make up a part of the equipment of every concrete worker.

$1.50 is the cost of a concrete Lawn Vase that sells for $10.00, easily meeting the competition of iron vases of $20.00 and $25.00.



Special ornamental mold circular enclosed in every catalog.

MIRACLE BLOCK

Its distinctive feature is the two overlapping rows of air spaces, which make it the only one piece frost and moisture proof block on the market.

Handsome residences and garages, substantial factories, barns, stores, and public buildings erected with it. Block Machine is automatic, rapid and adjustable.

Exclusive protection given with each machine.

Big 128 page illustrated catalog free to those interested in the cement business.

HOW ARE YOU?

Are you making any money in your Concrete business, or do you have trouble from want of information on best methods? If you need any advice on any Concrete job, write me, tell me what you are up against, as I have been working in concrete since **1873** and should know something about the business by this time, and most likely can help you. If I cannot, I will tell you so. My charges for water-proofing formula are **$2.00**, or for other information, unless for large work that requires more attention. Reasonable charges for large operations. Special information on constructing dams, water works wells, method of sinking large wells and foundations in soft earth or water, Iron reinforced Concrete construction, Terazzo floors and engineering difficulties, working concrete in freezing weather, under cut work, elastic moulds for making statuary, making moulds for garden vases and getting up the patterns.

I conduct a correspondence course in Concrete by mail for a limited number of pupils for **$20.00**, which includes my water-proofing formulas, coloring and compound for making blocks harder after made. Get your information from one who has done the actual WORK. You will save the price of a course on your first job. Address

U. S. Standard Cement Mixers and Block Machines

ARE THE STRONGEST, LONGEST AND EASIEST WORKERS ON THE JOB

U. S. Standard Junior Block Machine.

OUR **U. S. Standard** Junior and Senior Block Machines are both built upon the same basic principles, the former building a 16″, the latter a 24″ long block and all fractional lengths thereof. Both of these machines build hollow blocks 6″, 8″, 10″ and 12″ thick and veneer blocks 3″, 4″, 5″ and 6″ thick. The equipment also provides plates for circular blocks, angle blocks of any desired angles, porch pier blocks, chimney blocks, etc. These machines are capable of producing a greater variety of styles and sizes of blocks without additional investment than any other machine made, and for simplicity, speed, completeness, strength and beauty of blocks cannot be equalled.

THE **U. S. Standard** are continuous mixers. The measuring and proportioning of the cement, sand, gravel or crushed stone is done automatically. With the **U. S. Standard** measuring is positive, and does not vary with coarse or fine, wet or dry ingredients.

SPECIAL FEATURES—Accuracy in measuring, correctness in proportioning and thoroughness in mixing the ingredients. All these operations are automatic and absolutely reliable. Detailed information will be furnished upon application for our Catalog No. B.

E. C. Atkins & Co.
Silver Steel

MANY readers of the National Builder have made up their minds that they are ready to buy **Atkins Silver Steel Saws.** We know this because every mail brings us letters from high class mechanics who write to tell us how much they are pleased with their **Silver Steel Saws** or to say that they are just about to buy one. If you have not bought yet, we wish to say *now is the time.* Don't wait until you stub your toe against the Spring rush of business, but order your **Silver Steel Saws** *now* while there is time to make a careful selection.

ORDER THROUGH YOUR DEALER

He is entitled to your business and can serve you better than anyone else. Most likely he already sells them. Even if he does not, order *from* him just the same. He'll get them for you from his wholesale house. But try your dealer *first.* Then if he *won't* supply you, let us know. For your own sake you ought to use an **Atkins Silver Steel Saw** this Spring, that's sure, and now is the time to buy them.

SILVER STEEL—You ought to use a **Silver Steel Saw** because it will save you time and strength? Even if your boss *does* pay you for the time lost in filing the saw, don't you think you ought to use a saw that will run longest without re-filing. And if an **Atkins Silver Steel Saw** does not do this, take it back to your dealer and get your *money back.* That's simple. **Silver Steel** will hold its edge longest because we have discovered a formula for making steel which is far ahead of any other. If it isn't —remember—*money back.*

THE GRINDING—Atkins Silver Steel Saws are not simply ground with a thin back, they are taper ground—thickest on the tooth edge, two gauges thinner on the back at the butt—four to five gauges thinner on the back at the point and *gradually taper* toward the thinnest point. This gives them clearance—permits them to run free and easy. This is why they will cut faster than any other saws. If they don't—remember that guarantee—*money back.*

PERFECTION HANDLE—While we make some saws with the old style handle if you must have it, we recommend the Perfection Handle which removes all possible strain from the saw arm. Every ounce of power counts and less pressure is required in order to make the teeth cut fast. That's why **Atkins Silver Steel Saws** run easier than any other saw. If you don't find it so—remember that same guarantee of ours—*money back.*

HOW TO KNOW THEM—No saw is a genuine **Atkins Silver Steel Saw** unless the name **E. C. Atkins & Co.,** and the words **"Silver Steel"** are plainly marked upon the blade. Don't let anyone try to work off a cheaper saw on you as a genuine **Silver Steel Saw.** Make him show you our name on the blade. Then you'll know.

OUR FREE OFFER—We are still anxious to receive the names of high-class mechanics who are interested in fine tools and if you will send us your name and address, together with ten cents to pay postage, we'll send you a package worth while—a nail apron, an interesting booklet "Saw Sense," on saws, a monthly time book and information on saws that ought to interest every carpenter. AUGER BIT ESSENTIALS

The Fifth Reason why the well-known

RUSSELL JENNINGS BITS

are unsurpassed is the accurate

DOUBLE TWIST

which provides two smooth passages for the removal of chips.

¶ Repeated tests have proved conclusively that the double twist is the best for auger bits in the same way that it is the acceptable form of screw conveyors.

¶ Although it is sometimes claimed that the cheaper form, the bit with the solid center, clears easier, the claim is not substantiated by trial. Ask the carpenter—he knows.

BISHOPRIC WALL BOARD AND SHEATHING

ANY WEATHER is "Good Building Weather" when you use Bishopric Wall Board as a substitute for lath and plaster. It is cheaper and better and does away with all delays in building. It is nailed to studding dry, ready for immediate application of paper, paint, burlap, or any other kind of decoration.

Bishopric Wall Board Easily Applied

This substitute for lath and plaster is made of kiln-dried, dressed lath, imbedded in hot Asphalt Mastic, surfaced with sized cardboard and cut at the factory into 4x4 ft. sheets, which are easily and quickly nailed to studding, ready for immediate application of wall paper, paint, burlap, or other decoration.

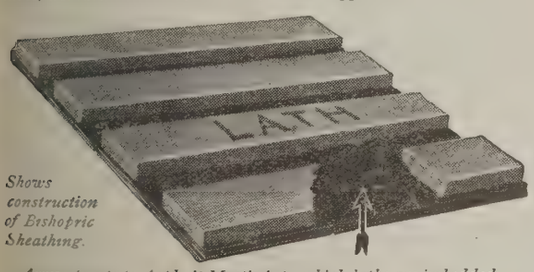
It is applied dry, is guaranteed not to swell, shrink, warp, crack, flake or blister; is clean, sanitary, and odorless; is proof against moisture, cold, heat, and vermin; saves fuel in winter and keeps out summer heat; also deadens sound.

It is suitable for dwellings, factories, new partitions in old buildings, finishing attics, porches, laundries, cellar ceilings, garages, etc.

Applied Dry Winter or Summer

Shows Construction of Bishopric Wall Board.

PRICE WALL BOARD AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6.40 per crate, or $2.50 per 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point.



Cheaper Than Lumber. Saves 75% on Labor. Does away with Building Paper.

BISHOPRIC SHEATHING

Ideal Material for Cement Buildings or Stucco Exteriors. Proof against Dampness.

Bishopric Sheathing is made of same materials as Wall Board, but finish is not necessarily so fine, therefore costs less. It is of uniform thickness, insuring a perfectly even surface when applied.

Bishopric Sheathing is nailed to studs, with lath and asphalt side exposed. Over laths, weather boards are nailed or cement applied.

Shows construction of Bishopric Sheathing.

Arrow points to Asphalt Mastic into which laths are imbedded.

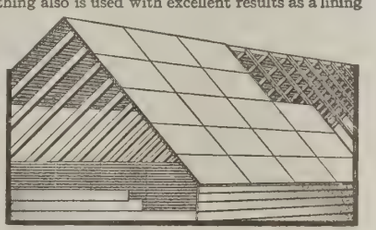
Bishopric Sheathing makes a more solid and substantial wall than lumber. There are no gaping joints; no widening cracks due to shrinkage; no knot holes.

The Asphalt Mastic in Bishopric Sheathing is a non-conductor, moisture cannot penetrate it. It is proof against vermin. The pests cannot bore through the tough, gummy Asphalt Mastic. In applying weather-boards over the laths, dead air space is left between the laths forming splendid insulation. Does away with the expense of building paper and cost of its application.

One Wagon load of Bishopric Sheathing covers an area from six to ten times as great as one load of lumber—a tremendous saving in hauling. Five thousand feet can be hauled in an ordinary wagon.

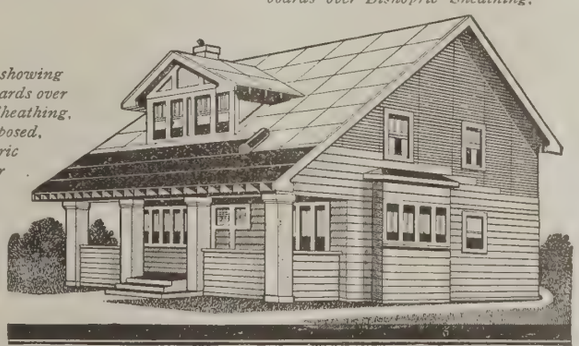
Wall Board and Sheathing are shipped in crates

The cost of applying Bishopric Sheathing is but $2.50 per 1000 feet—A SAVING OF ABOUT 75 PER CENT. Furthermore, 1,000 square feet of wood sheathing covers but 750 feet of surface, 20% less being due to tongue and groove. In Bishopric Sheathing 1,000 square feet covers 1,000 square feet of space.



In applying ordinary lumber, heavier scaffolding, more tools and greater scaffold floor-space are required. In applying Bishopric Sheathing, one man drives a few nails in each sheet; a common laborer or boy can finish the nailing.

Bishopric Sheathing insures comfort during the construction of the building. As soon as the building is closed in with Bishopric Sheathing, the men may work in comfort on the inside during bad weather, finishing the outside on suitable days. This insures continuous work, without loss of time, enabling the contractor to hold his men and complete the work in the least possible time.



Bishopric Sheathing is used with equally splendid results under flooring and as a substitute for roofing boards. Used under floors, it serves as a sound deadener and keeps out dampness; used under the shingles, it keeps out summer heat.

ITS MANY USES—Bishopric Sheathing also is used with excellent results as a lining for dairy barns, ranch houses, poultry houses, driving stables or any out-door building where protection from the elements, Summer or Winter is desired.

Bishopric Sheathing is the ideal material for cement exterior or stucco work. Cement firmly adheres to the laths and Asphalt Mastic and makes a solid, smooth exterior. For factory or residence this form of cement or stucco construction is the cheapest and best known.

Shows Bishopric Sheathing over rafters ready for Bishopric Roofing, also Weather-boards over Bishopric Sheathing.

Ideal home showing Weather-boards over Bishopric Sheathing, lath side exposed, also Bishopric Roofing over Bishopric Sheathing. (smooth side of sheathing exposed)

PRICE SHEATHING AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6, or $2.35 per square of 100 square feet, f. o. b. New Orleans, La., Cincinnati or Alma, Mich. We ship from nearest point.

Write for Descriptive Booklet and Samples of Bishopric Wall Board, Bishopric Sheathing and Bishopric Roofing—All will be sent free.

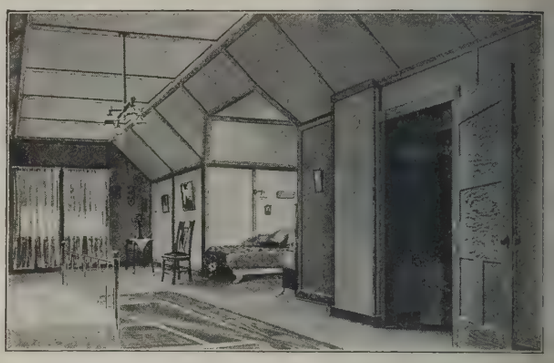
UTILITY WALL BOARD

A Fibrous Water-Proof Board Made in Convenient Widths and Lengths

To be Used Instead of Lath and Plaster in New Building or Repair Work



Make your Garage Warm by Lining with UTILITY Wall Board

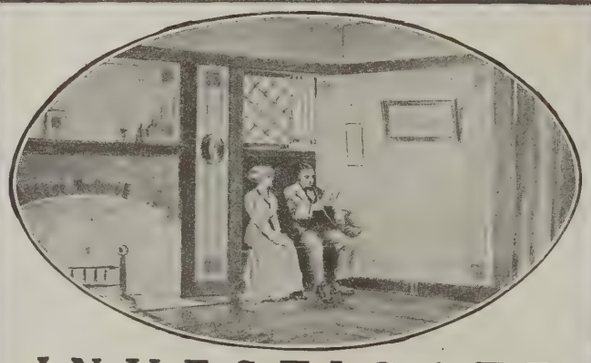
Mr. Contractor

This is your chance to make more money and finish your jobs quicker. UTILITY WALL BOARD is right in quality and price. It has come to stay and is rapidly taking the place of lath and plaster.

Every up-to-date contractor and builder should get samples of UTILITY WALL BOARD at once. There are hundreds of places it can be used with a profit to you and satisfaction to the owner.

Remember that all delays of the plasterer are a thing of the past for those who use this modern building material.

This shows how an Attic looks after being finished with UTILITY Wall Board.



Utility Wall Board is better than lath and plaster. It saves the user a lot of money besides giving him a handsome, durable job. Utility Wall Board can be painted and decorated with the finest results. Utility Wall Board is being used in both small and large buildings. Everyone likes it.

Write Now for FREE Sample and Prices

Utility Wall Board can be applied by the carpenter—nailed right to the studs—easy and clean to handle—cuts with a saw—fits any space and can be put on in winter or summer—no waiting for plaster to dry—no cracked walls—no dirt—no ruined decorations—warm in winter and cool in summer

THE HEPPES COMPANY, 4502 Fillmore Street, Chicago, Ill.

INVESTIGATE Compo-Board

Best for Walls and Ceilings.

Better then lath and plaster. More economical and durable. Can be put on in any weather and will stay up and look well as long as the building lasts.

Compo-board is made of strips of thoroughly dried lumber well glued. These strips are then covered with a specially prepared moisture proof paper, which is cemented under intense heat and pressure.

This makes a wall lining that will last indefinitely. Cannot crack or crumble off. Cannot chip off or mar by banging furniture into it. It is moisture and cold proof and fire resisting. Warm in winter and cool in hot weather.

Beside being a wall lining, Compo-Board has many other uses around the house and in the yard, in the office and factory. For remodelling the house or finishing off an extra room in the attic or basement, it is ideal. Summer cottages can be made as warm as the city home. Use it for partitions or back plastering.

Compo-Board can be had in strips four feet wide and one to 18 feet long, in any length in even feet.

SEND FOR SAMPLE AND BOOKLET

Fully describes Como-Board and its many uses and advantages, and the sample will show you what it is.

RED GUM

AND

SAP GUM

A good many of the illustrations selected by the writer of this series of **RED GUM** and **SAP GUM** advertisements, which have appeared in the National Builder during the past year, have been of buildings located in New York City. This selection has been purposely made, as it has been deemed the best possible acknowledgment of the value of this wood that it should be so thoroughly appreciated so far away from the section where it is produced, and in New York, where it is the general practice to use the very best of materials in the modern buildings which are being erected.

Trimmed in Gum—"A [illegible] Finest Hardwood"
The Beaconsfield, 116th Street and Riverside Drive, New York
Schwartz & Gross, Architects

RED GUM for interior trim, natural or in any standard finish—and **SAP GUM** for the **"best wood ever"** for **white enamel,** are absolutely satisfactory woods when **properly** seasoned and **properly** handled in the trim mill. If their intrinsic value and beauty are taken into consideration, their cost is almost absurdly low.

"Clinch Your Reputation for Leadership by Recommending (and Using) GUM"

*Builders desiring to see samples of **Red and Sap Gum,** both rough and finished, or who wish market prices of selected **Red and Sap Gum,** are invited to correspond with any of the following firms:*

J-M ASBESTOS ROOFING ON THESE BUILDINGS OVER TWENTY YEARS

Illustration shows the plant of the Robinson Clay Products Co., Akron, Ohio, which was covered with J-M Asbestos Roofing over twenty years ago. Although this roofing has had to withstand the deadly gases used in manufacturing clay products in addition to the elements to which all roofings are subjected, it is in perfect condition today.

J-M Asbestos Roofing is not in the least affected by gases, chemical fumes, fire, salt air, heat or cold. It is practically indestructible because made of sheets of indestructible Asbestos—a rock quarried like slate or granite—firmly cemented together with Trinidad Lake Asphalt, the mineral which has withstood the severe duties of street paving for more than thirty years.

J-M Asbestos Roofing is the cheapest-per-year roofing on the market, because it outwears several ordinary roofings and never has to be painted.

PROTECT YOUR FINGERS

by using a CRESCENT Jointer with Safety Head

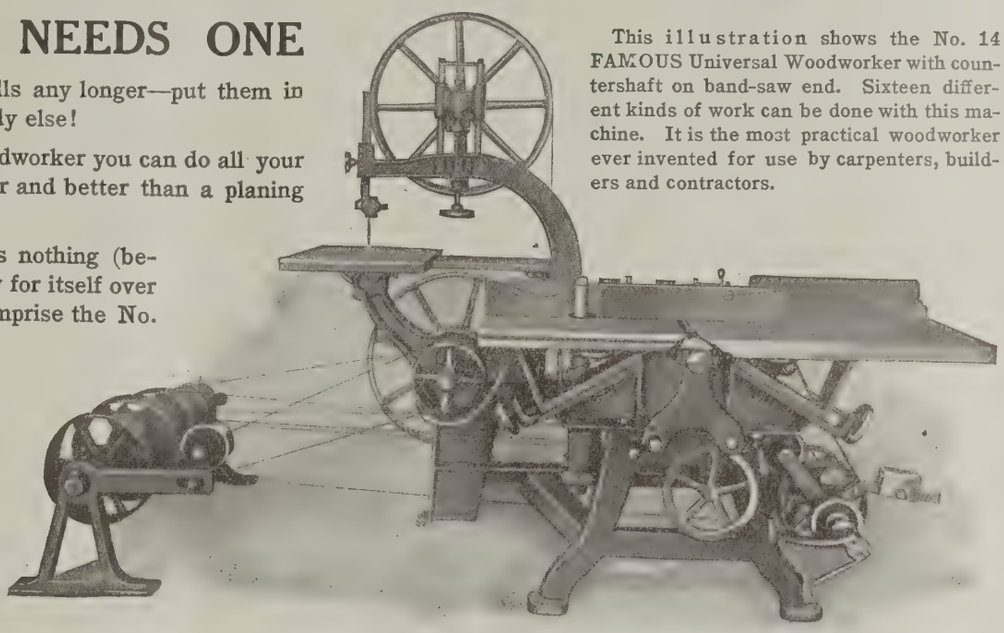
The knives in CRESCENT Safety Heads are made of high speed steel which will hold an edge longer and turn out better finished and more work than can be done on a common jointer with ordinary knives. You may crowd the machine to the limit and the quality of work will be just the same as though you hadn't crowded it a bit.

The price of these splendid machines is very reasonable considering the very high quality of the machines and the enormous amount of accurate work they are capable of turning out.

Send for catalog giving complete description. It tells about our elegant line of Band Saws, Saw Tables, Jointers, Borers, Shapers, Planers, Planer and Matchers, Pole Rounders, Disk Grinders, Variety Woodworkers.

THE CRESCENT MACHINE COMPANY 10 MAIN STREET LEETONIA, OHIO, U. S. A.

PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS IT WILL HELP.



The Famous Universal Woodworker is worth more to your business than sixteen ordinary wood-working machines

EVERY CARPENTER NEEDS ONE

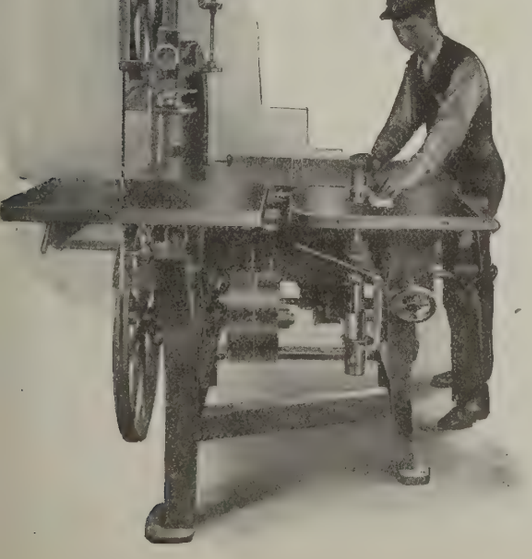
Don't pay out your profits to planing mills any longer—put them in our own pocket. Stop working for somebody else!

With a No. 14 FAMOUS Universal Woodworker you can do all your millwork yourself—and do it quicker, cheaper and better than a planing mill can.

The first expense is small, the upkeep is nothing (because we guarantee it for life) and it will pay for itself over and over again. The following machines comprise the No. 14 FAMOUS Universal Woodworker:

This illustration shows the No. 14 FAMOUS Universal Woodworker with countershaft on band-saw end. Sixteen different kinds of work can be done with this machine. It is the most practical woodworker ever invented for use by carpenters, builders and contractors.

Sixteen Woodworking Machines in One



1—27 inch Band Saw.
2—12 inch Jointer.
3—Saw Table with raising or lowering arbor.
4—Single Spindle Shaper.
5—Boring Attachment, arranged on special boring spindle.
6—Pony Planer.
7—Tongue and Pole Rounder.
8—Hollow Chisel Mortiser.
9—Single End Tenoner.
10—Drum Sander.
11—Disc Sander.
12—Knife Grinder.
13—Emery Grinder.
14—Band Resaw.
15—Spoke Tenoner, Rim Borer and Wheel
16—Adjustable Felloe Rounder. [Equalizer.

A Complete Machine Shop

If you contemplate installing a machine shop, buy a No. 14 FAMOUS and instal sixteen different machines **on one base.** If you have machinery **now,** and are thinking of buying more, sell what you have and buy a No. 14 FAMOUS. You'll get more satisfaction and be money to the good.

When you buy separate machines you waste time, floor space and money. You require more labor, you must have a separate belting, pulleys and shafting—or motors—for each machine, and must set aside a large sum for depreciation. With a No. 14 FAMOUS you buy just ONE machine, and just enough power transmission equipment for that one. Under our broad guarantee there will be no depreciation expense and no fear of breakdowns. There is nothing complicated and no time lost in adjusting the attachments for the different operations.

You owe it to your business to write RIGHT NOW for full particulars of the machine, and of our proposition which allows you to try before you buy. Don't hesitate, but ask today.

This shows our No. 14 being operated as a Single Spindle Shaper.

Stanley Tools

STANLEY CONCEALED RATCHET BIT BRACES

are of the highest quality as regards workmanship, material and finish, and embody improvements and refinements in mechanical construction not previously contained in any Bit Brace. In this form of ratchet there are no projections to hurt the hand, and the working mechanism being encased, it is always free from dirt, grit and moisture, and retains oil for a long time. These Braces are fully warranted, carrying with them the guarantee of a Company who have been manufacturing high-grade Carpenters' and Mechanics' Tools for over fifty years.

ASK FOR BOOKLET

The Boss Improved Floor Scraper

Has double swivel allowing the knife to be set in any position. Gauge can be set for any thickness of shaving and keeps knife from making depressions in floor. Gives knife double support. The pear-shaped wheel which is in the gauge is attached to the gauge in front so that when the scraper is let down to take shaving, it lets the knife down gradually, and prevents the knife from making a deep cut. With this gauge and wheel attachment, the knife will leave no mark. Impossible to do poor work. Adjustment simple—positive. Gauge can be removed instantly. Sanding attachment. Prices very low. Write for descriptive circular.

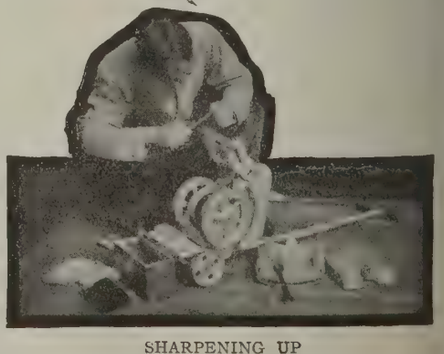
"Nothing but the Highest Praise for THE TRIPLE "A" MACHINE"

This Letter is Self Explanatory

Flint, Mich., 11-23-1910.

Triple "A" Machine Co.,
Chicago, Ill.

Gentlemen:—
I take pleasure in writing you regarding the workmanship of your mechanics in scraping the floors of the Flint P. Smith Building, this city.
I have tried out three different floor scraping machines and am satisfied that the Triple "A" was the best. Owing to the work which your men and machines were able to do, I can have nothing but the highest praise for the Triple "A" Machine.
Yours truly,
W. E. WOOD.



Surfacing Floors

(by contract)

pays when you have the proper equipment.

We can't do all the floor surfacing in the country, but we're willing to furnish the machines and give others a chance.

Any carpenter can successfully operate **The Triple "A" Spring Driven Floor Smoother**—It's easy—the motor spring furnishes power.

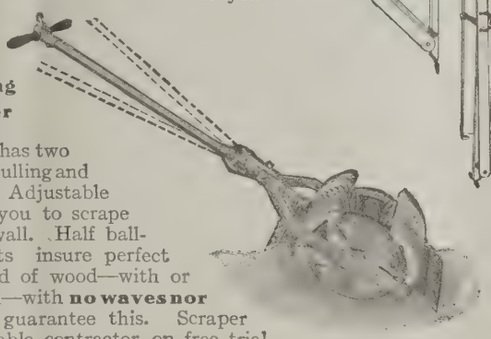
The Latest WEBER Work Savers

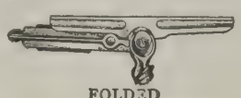
SAVE time and you make money. Crude tools delay work and turn out "botch" jobs. My devices are right up to the minute—mechanically correct—and you can't afford to be a day without them, Read every word of this ad; then send for complete catalog and prices. I've been a successful contractor for 25 years, and I absolutely **know** I can save you money at every turn of the road.



Double Scaffold Bracket

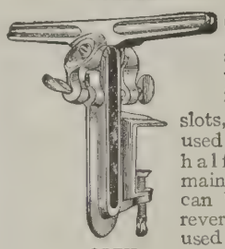
is the only one that can be adjusted for use on any kind of buildings. Will not swing sideways and has two scaffold boards which make it ideal for putting up cornices. Weighs only 22 lbs., but is much stronger than the old, heavy scaffolds. Can be folded without loosening a single bolt. When folded, 24 brackets take up space only 3 x 4 x 5 feet. In use 10 years.

WEBER



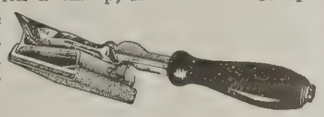
Double-Acting Floor Scraper

improved model, has two knives—one for pulling and one for pushing. Adjustable handle enables you to scrape right up to the wall. Half ball-and-socket joints insure perfect work on any kind of wood—with or against the grain—with **no waves nor chattering.** I guarantee this. Scraper ent to any reliable contractor on free trial.



Folding Saw Vise

holds the saw with rigid unyielding grip and is as nearly noise-preventive as such a tool can be made. Can be thumb-screwed to any plank or bench in an instant. When folded, it takes up no more room than a common hammer. Saves many an aching arm from using dull saws and should be in every kit.



FOLDED

Cabinet Scraper and Sander

affords a firm grip and can be controlled with ease in the tightest corners. Knife is fastened with a clamp, not with holes or slots, and can be used till but a half inch remains. Scraper can be quickly reversed and used for sandpapering and polishing. Weight 22 oz. Handiest tool ever made for the purpose.

OPEN

Sharpening Device

for floor scrapers holds the file at the correct level for an even, true edge on Weber and other floor scraper knives. With this tool, anyone can do excellent work in short time without previous experience. Well worth investigation.

TRY THIS OUTFIT YOURSELF

and learn, by actually working with it, just what it can do.

If you knew the time and money you could save by doing your floor finishing with the Acme Floor Scraping Outfit, you would not hesitate a day longer to send for the machines. If you have floor scraping to do, there is absolutely no reason why you should not accept my free trial offer. I do not ask for any money and don't expect any if you are not satisfied with the results of your trial. Send back the outfit. That's all I ask.

If you haven't my booklet which gives full detailed description of my floor scraping equipment, then let me send it to you, together with full particulars of my free trial offer. Write me for these now and I will send them by return mail.

JOSEPH MIOTKE, 249 Lake St., Milwaukee, Wis.

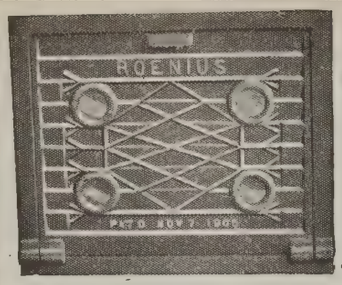
A FEW EXPRESSIONS FROM THE WEST

Lamar, Colo., Feb. 6, 1911.
Jos. Miotke,
Milwaukee, Wis.

Dear Sir—Enclosed find our check in full payment of the Acme floor scraping outfit which you sent us on trial a few weeks ago.

Beg to say that the scraper and attachments have given good satisfaction.

Yours very truly,
G. A. BROWN MFG. & LUMBER COMPANY.



Oakes, N. D., Feb. 10, 1911.
Jos. Miotke,
Milwaukee, Wis.

Dear Sir—In reference to the Acme floor scraping outfit which you sent me on trial a few days ago, will say that the machine works perfectly satisfactory. It is not necessary to have new floors to demonstrate that machine on. I tried out the scraper under various conditions, both on old and new flooring, and the results are entirely satisfactory in every particular. I believe you have one of the most up-to-date machines and attachments there is on the market. I have sharpened one blade with your sharpener, and I do not think it has an equal and is worth considerable to anyone to sharpen and turn most any kind of a scraper blade.

I do not consider I spent as much time learning to use the Acme as I would learning an inexperienced man to file and turn a hand scraper. Your outfit certainly does the business and it will be the means of my saving many dollars on floor scraping work.

Nicholls' Rafter Framing Rule

FULLY EXPLAINED

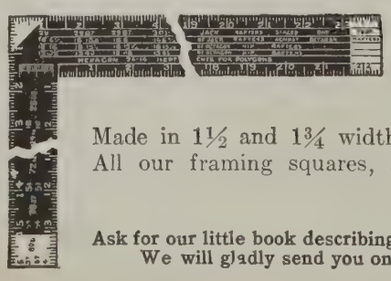
If your roof raises 8 inches to the foot, look under 8 and you will find your figures for length of common rafter, hip or valley rafter per foot run, length of first jack rafter and the difference in the length of others spaced 16 and 2 ft. centers, also their cuts.

FOR EXAMPLE

If your roof raises 8 inches to the foot, or, as it is called, third pitch, under 8 on the first line are the figures 14.42; this is the length of common rafter per one foot run; if the building is 16 feet wide, half the width of building would be the run of common rafter; in this case it would be 8; multiply

14.42 by 8
8

115.36



you have 115.36 inches, or 9 feet 7⅜ inches. To obtain the bottom and top cuts of common rafters, use the figures 12 on body and 8 on tongue; 12 side gives bottom cut; 8 side gives top cut; the same figures give bottom and top cuts for jack.

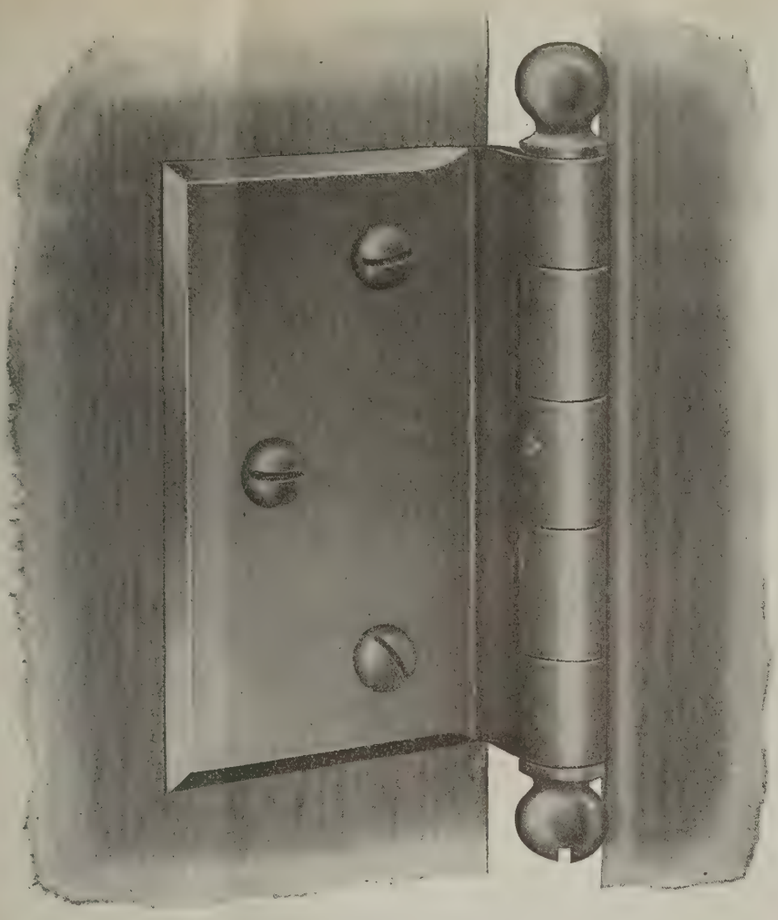
On the second line under 8 are the figures 18.78; multiply these figures by 8, which is the run of common rafter and gives lengths of hip or valley rafter.

18.78
8

This gives 150.24 or 12 feet 6¼ inches. This is the correct length of hip or valley rafter.

On the fifth line under 8 are the figures 10 and 12; by placing square on stock to be cut at these figures, 10 on body, 12 on tongue, and marking on 12 side, this gives side cut of jacks against hip or valley rafter.

Our No. 100A has the octagon roof framing rule on back of square as per small cut, giving all lengths and cuts of rafters for same. This square sells for **POLISHED STEEL $2.25 OXIDIZED COPPER $2.50 NICKEL PLATED $3.00**



Made in 1½ and 1¾ width tongue. Ask your dealer for these, but if he will not supply you we will prepay express. All our framing squares, also Nos. 100-1-2 and 3 standard squares have **HARDENED CORNERS.**

White portion of cut shows part hardened

Ask for our little book describing our framing rule. We will gladly send you one upon request.

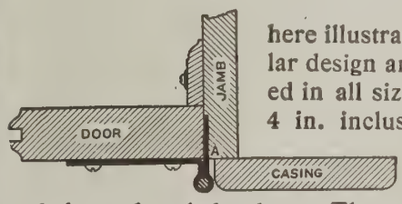
No. 450 —CUT FULL SIZE, 3½ INCH

WE INITIATE—NEVER IMITATE

A Big Hit

Is the new tip with which "NATIONAL" Butts are now equipped, both Common and Ornamental.



The TIP is threaded and screws into the Butt in both the Japanned and Plated finishes.

It is also SLOTTED for A SCREW DRIVER, making it easy to remove the tip and affords ready access to the pin.

The slot also indicates instantly which is the bottom of the butt—a feature greatly appreciated by the carpenter.

These are exclusive "NATIONAL" features.

Style No. 450

here illustrated is a very popular design and can be furnished in all sizes from 1½ in. to 4 in. inclusive. These butts are highly polished, double plated and have beveled edges. They match escutcheon plates with beveled edges. Ask for "Catalog B" and give dealer's name.

NATIONAL MFG. CO., STERLING, ILL.

It is Round—and It is a Wonder

The new Carborundum Carpenters' Bench Stone is just the right size for that rotary motion required in sharpening chisels, plane bits, etc. Made one side coarse grit for bringing the tool to an edge, the other fine grit for finishing. Like all Carborundum sharpening stones, it gives a better edge in less time—never fills or glazes and wears uniformly.

Fighting The Trust!

The Smashing Anti-Trust Fight Now On!

Trust Prices Eclipsed at Last!

An absolutely *first-class* **high-grade** watch at a price within the reach of the people—the Burlington Special Anti-Trust Watch.

The World's Masterpiece of watch manufacture—the Burlington Special—now sold direct to the public at its *rock bottom, anti-trust* price (and besides without middlemen's profits.

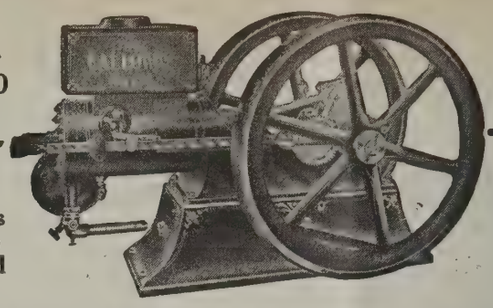
We do not care what it costs—we will uphold our independent line and so we are making the most sweeping, baffling offer ever made on watches.

Some trusts are legal and some are not. **We do not say that the watch trust is illegal;** but we do say that the **methods** of the giant factories in making "contracts" with dealers **to uphold double prices** on watches is very **unfair**—unfair to **us** and **you.** Hence our **direct** offer on the Burlington at the **very same** price the **Wholesale** Jeweler must pay.

This is *your* opportunity—**NOW**—while this great Anti-trust offer lasts—get the best watch made anywhere at one-third the price of other high-grade watches. Furthermore, in order to fight the Trust most effectually, we even allow terms of

$2.50 a Month on our finest watch—easiest possible payments at the rock-bottom price, the identical price the **Wholesale** Jeweler must pay.

WATCH BOOK ON REQUEST.



Now do not miss this opportunity. At least we want you to know about WATCHES and WATCH PRICES. Write today.

BE POSTED—Send a postal or letter and get the free book. It tells you how to judge a watch. You should get this great book if you ever expect to own a watch.

30 Days Free Trial

Built for Service

CONCRETE MEN ATTENTION

Galloway Engines are made in all sizes from 1¾ to 28 H. P. They run on gasoline, naphtha, kerosene or distillate. We are furnishing complete mixing rigs and our price means a big saving of money to you—$50 to $300, depending on the engine you buy. You have the privilege of trying the outfit 30 days. If it is in any way unsatisfactory we refund your money with interest and pay freight both ways.

The Galloway Gasoline Engine

SIMPLEST ENGINE BUILT

Only four things to do:

Turn on the switch, turn on the oil, turn on the gasoline, give the flywheel a start and the Galloway will go right along all day without further attention. It is ideal power for a small shop, and it's got the capacity to take care of your growing needs.

The Galloway has been classed as a standard, high grade engine for fifteen years. Over 4,000 in use in Iowa alone. Thousands in every other State and Territory.

If you try the Galloway engine, you will find that it is not overspeeded. Remember, the bore and stroke count, and you don't have to drive your engine faster than you ought to drive it to get the rated horse power. Rated by actual brake test.

On the larger sizes, if it is not entirely convenient for you to pay all cash, we will take your note for the balance at the regular rate of interest for six months.

The price given is for the five-horse power only, but we make these engines in seven sizes.

Ask for free information on stationary and portable gasoline engines from two to twenty-eight horse power. We make the best, and we price them at a reasonable figure. Write today.

JOHN BOYLE & CO.'S Awning Stripes have been the Standard for 50 years.

All "asphalt roofing" is not Trinidad Lake Asphalt Roofing—there's a great big difference. Look out for that when you buy your roofing.

Ordinary so-called asphalt roofings are made of artificial products masquerading as real asphalt. They are nothing more than the residue from petroleum oil or native bitumens made into a black pitch, which is easily affected by changes in weather.

Genasco

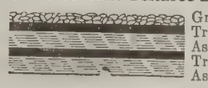
the Trinidad-Lake-Asphalt Roofing

is made of genuine *natural* asphalt—perfectly stable and uniform in quality.

Trinidad Lake Asphalt is endowed by Nature with *natural* oils; and they stay in it. This gives Genasco its wonderful resistance to rain, snow, sun, wind, heat, and cold—and keeps it lastingly waterproof.

The artificial asphalts have oils *mixed* with them, but they haven't the quality of the oils in the natural product; and they soon evaporate and leave the roofing "dead"—and it cracks, breaks and leaks, although at the first it may look like Genasco, the real Trinidad-Lake-Asphalt roofing.

Natural asphalt in roofing is the greatest weater-resister known. To make sure of roofing that will permanently protect, ask your dealer for Genasco, the Trinidad-Lake-Asphalt Roofing, with either mineral or smooth surface. Fully guaranteed.



The Kant-leak Kleet waterproofs the seams of Genasco Roofing without cement, does away with nail-leaks, and gives the roof an attractive finish. Ask your dealer for Genasco with Kant-leak Kleets packed in the roll.

Notes on Heating and Ventilation

Price, $2.00 delivered

By *John R. Allen,* M. Am. Soc. Heating and Ventilating Eng.; Junior Professor Mechanical Engineering, University of Michigan, Ann Arbor.

Second Edition; Bound in Cloth, 6¾x4¾ in.; 200 pp.

This book is a resume of lectures delivered to classes in heating and ventilation at the University of Michigan. It is written primarily for the steamfitter and designer of heating systems It presupposes a knowledge of the construction and operation of the simpler forms of heating systems. Reduced to as brief a form as possible, so that readers can readily find notes or data desired.

Contents—Theory of heat and measurement of temperature. Heat losses from buildings; rules for determining heat losses in different constructions. Different forms of heating systems; their advantages, disadvantages and relative economy. The design of a direct steam heating system. The design of an indirect heating system. Steam boilers and steam piping. Carrying pipes underground, etc.

Investigate This Farm Home Furnace For Any Kind of Fuel

Let us send you this Home Heating Book, with other booklets and prices first—Now's the time to investigate—Think it over. We will save you first cost and lasting economy and reduce your fuel bills ½ to ⅔. Find out about the experience of thousands of satisfied owners of Hollands—Double Grate Surface—Patented Corrugated Air-admitting Double Firepot, burning fuel from sides and top, nature's way, for greatest even heat. Consumes gas, soot and clinkers with least smoke. No explosions. Book tells all improved tested points, convenience and satisfaction of the Holland. Unlike others. Less joints. No bolts. Simpler and easier and cleaner to run. Ideal damper arrangement. Consumes less fuel. Gives longest service from construction and double materials used where strains are greatest. Save money with

Holland Gas and Soot Consuming Furnace

FREE

Write for it Today

Years of experience in the heating business has taught us that the strain in any furnace is from the fire line up and that is why the combustion chamber of the Holland Furnace is over an inch thick at the top where our patented radiator is placed. Radiator is cast in one piece and altogether from the base to the top, our furnace has but five joints.

Burns any fuel—soft coal—slack screens—hard coal, lignite, or wood with least waste. Smoke travels twice as far, no heat wasted. Equal heat all through the house in all pipes. Special Double Guarantee. Book has many other points to tell you.

Save ½ to ⅔ on Fuel

Our fuel-saving claims for the Holland have been proven by thousands of satisfied owners. You be the judge. Just send name on postal for our Big Catalog—Free with other Home Heating Booklets and prices. Who's your dealer?

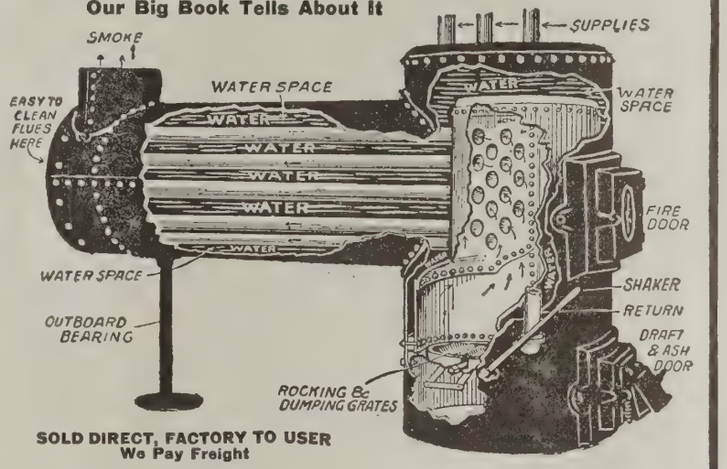
CONTRACTORS

BEFORE you set a price on that next house get Andrews' Big Book on Heating and Free Estimate covering the price, complete, of an Andrews Plant, shipped you direct, "knock down," ready to erect.

BIG MONEY FOR YOU

THIS SYSTEM is the easiest for you to handle, as we do all the work of planning, cutting and fitting—yes, and take the risk of the plant's success. We know the Andrews Systems are the best that can be produced in every way. Your carpenter's helper can easily set up the plant, following our complete and simple directions. It will pay you to investigate our proposition which enables you to make the profit that would otherwise go to the heating contractor. Send us a rough sketch for an estimate on your next job. We will quote you a net price or quote price to your customer, allowing you a liberal commission. Let us help you make some money.

How to Get an Andrews System



First send us a rough sketch of floor plans (or architect's plans) of the house to be heated, giving size of rooms, windows, height of ceiling, construction, etc., and get our Free Estimate of cost complete. We will tell you all about the plant, what it includes and send with the estimate our big Book fully describing everything. Our engineers then design your plant to meet your individual requirements. Pipes are cut to fit and threaded. All fittings, etc., are marked and boxed, and the entire plant is shipped you, freight paid, ready to erect. Such simple and complete instructions are given that a carpenter's helper can easily set the plant up.

Vulcanite
Standard for 60 Years

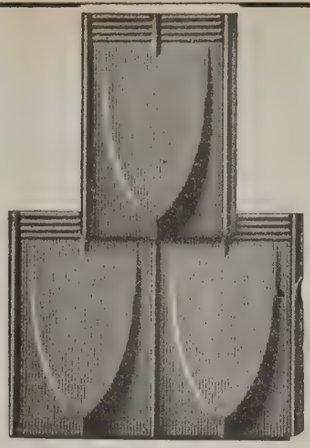
Here's a roofing that has passed every test that *proves* good roofing—that has been made and sold on merit for sixty years.

Think of the experience behind it. Consider the number of highest awards it has received at expositions. Study the points that make it so good.

Made from the highest priced mineral compound known and the purest felt obtainable, in our own mills where we can watch the manufacture from start to finish. We use no paper or cheap filler—just the pick of materials that make roofing durable.

VULCANITE roofing will not freeze or crack—climatic conditions have no effect whatever. It's the most extensively used roofing in the world today because—there are reasons.

VULCANITE CRYSTAL SPAR SIDING



A new building material that has made good for use on Bungalows, Summer Cottages, Residences, etc. Fire and water-proof. Easy to apply, never cracks and saves painting and building paper. Used with clap-boards, this siding makes a substantial and well appearing building, besides effecting an all-around economy. Packed in rolls, 40 feet 6 inches long by 32 inches wide.

Send For Samples

To enable the carpenter, builder and contractor to be his own judge and jury of VULCANITE Roofing and VULCANITE Crystal Spar Siding we will send liberal samples free upon request. We merely ask you to examine it—to test them in competition with other brands—and to read our literature. Send today.

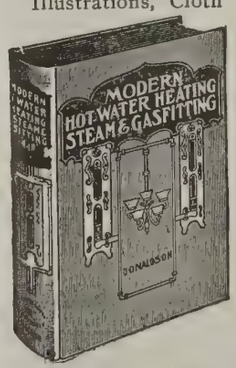
USEFUL BOOKS FOR CONTRACTORS

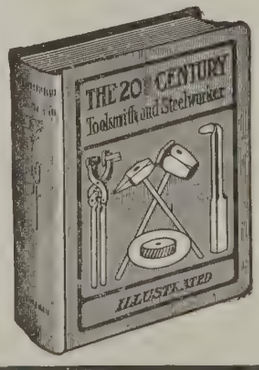
PRACTICAL UP-TO-DATE PLUMBING. By George B. Clow. 310 Pages, Over 250 Illustrations, Large 12mo, Cloth. Price.....$1.50



A practical, up-to-date work on Sanitary Plumbing, comprising useful information on the wiping and soldering of lead pipe joints and the installation of hot and cold water and drainage systems into modern residences. Including the gravity tank supply and cylinder and tank system of water heating and the pressure cylinder system of water heating. Connections for bath tub. Connections for water closet. Connections for laundry tubs. Connections for wash-bowl or lavatory. A modern bath room. Bath tubs. Lavatories. Closets. Urinals. Laundry tubs. Shower bath. Toilet room in office buildings. Sinks. Faucets. Bibb-cocks. Soil-pipe fittings. Drainage fittings. Plumber's tool kit, etc., etc. The composition and properties of solder and how to make it, are carefully treated and a chapter is devoted to useful information. There are given a large number of valuable tables giving the pressure at different elevations, capacity of pipes, etc. The work also contains over fifty carefully prepared drawings, giving complete piping connections for home, tenement and office buildings.

MODERN ESTIMATOR AND CONTRACTOR'S GUIDE. FOR PRICING ALL BUILDERS' WORK—WITH MANY TABLES, RULES AND USEFUL MEMORANDA. By Fred T. Hodgson, F. A. I. C. 318 Pages, 100 Illustrations, 12mo, Cloth. Price.....$1.50

One of the most desirable books for the general builder to have, is a good and reliable work on estimating; and we are certain the book we are now offering, if the large number of favorable testimonials and press notices we have received is any indication, is one of the best, and most reliable books on the subject that has ever been published on this continent—or any other for that matter. We have no hesitation whatever in recommending this book to our patrons who want a good work on estimating. The work gives a lengthy and clear explanation of the several methods employed in estimating, among which may be mentioned, "Estimating by comparison," "Estimating by the cubic foot," "Estimating by quantities," "Estimating in detail," and several other systems.



HOT WATER HEATING, STEAM AND GAS FITTING. By Wm. Donaldson. Large 12mo, 250 Pages, Over 100 Illustrations, Cloth Binding. Price.....$1.50

A modern treatise on Hot Water, Steam and furnace Heating and Steam and Gas Fitting, which is intended for the use and information of the owners of buildings and the mechanics who install the heating plants in them. It gives full and concise information with regard to steam boilers and water heaters and furnaces, pipe systems for steam and hot water-plants, radiation, radiator valves and connections, systems of radiation, heating surfaces, pipe and pipe fittings, damper regulators, fitters' tools, heating surface of pipes, installing a heating plant and specifications. Plans and elevations of steam and hot water heating plants are shown and all other subjects in the book are fully illustrated.

The closing chapter, devoted to useful kinks, contains information on a variety of subjects which will be found of interest and value to the workman, as will also the many useful tables given at the end of the volume.

THE 20TH CENTURY TOOLSMITH AND STEEL-WORKER. By H. Holford. 240 Pages, 120 Illustrations, 12mo, Cloth Binding. Price.....$1.50

This book is written in the interests of all mechanics connected with the working and manufacture of steel into tools, and gives all the secrets and obstacles to be overcome towards making steelwork or toolmaking a success. It will be invaluable to the young mechanic and place him years in advance of his fellow workman, by the reading and a little reflection of its contents.

It is not comprised of quack theories or foolish ideas, and is not written by a college student, who knows nothing except what he has been told or gathered up from papers and periodicals. But is written by a thorough expert mechanic who has spent the best part of his life over the anvil with the hammer and tongs.

11 TOOLS IN ONE

6 Months Free Trial

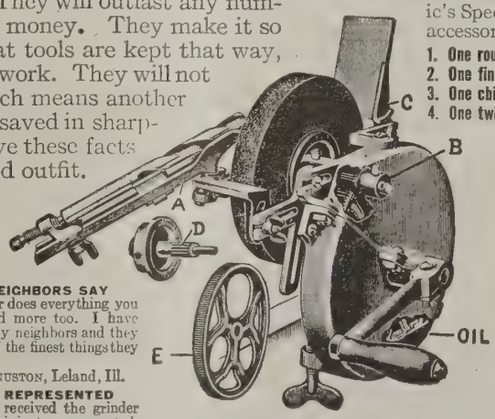
Special Offer on Shop and Factory Outfit

We want every carpenter, every shop, factory, contractor and tool-user to try this grinding, buffing and polishing outfit for six months free—a whole half year for you to find out how this perfected genuine Carborundum grinder saves tools, saves time, and earns money for any shop, factory, or individual tool-user. We want you to prove these facts on your own tools. The whole half year's use will cost you nothing. Try it free for 6 months is what we ask and prove it is a big money-maker for you. Then send it back, if you wish—no hard feelings if you do. Send back the coupon at the bottom of this page for our 6 months' free trial offer.

LUTHER DIAMOND TOOL GRINDER

25 Times Faster than the Grindstone
6 Times Faster than Emery Wheels

The wheels on this grinder are genuine Carborundum. Nothing is so hard as Carborundum except the genuine diamond. Wheels actually made of genuine diamond would cut no faster. In reality Carborundum crystals are artificial diamonds, made by fusing the elements of real diamonds in the electric furnaces at Niagara Falls, in which fire brick melts and runs like butter. In this *utmost* heat, Carborundum crystals get a temper and sharpness that cuts hardest steel or toughest malleable iron as emery does copper. Carborundum wheels do not glaze—they peel steel away in tiny shavings at lightest touch—no hard pressure necessary, no frictional heat, no water cooling necessary, no danger of drawing temper. Genuine Carborundum wheels do not get soft in spots, wear lopsided, or glaze. They will outlast any number of emery wheels, saving that much money. They make it so easy to keep tools keen and bright, that tools are kept that way, and that means more, faster and easier work. They will not draw temper and tools last longer, which means another saving—to say nothing about the time saved in sharpening. But don't take our word—prove these facts by a half year's free use of this splendid outfit.



11 TOOLS IN ONE

This special offer on our shop and factory grinding, buffing and polishing outfit is a remarkable value—the greatest reasonably priced grinder offer ever made. This outfit, on which we will make a 6 months' free trial offer, consists of one Mechanic's Special Luther Diamond Tool Grinder with the following accessories:

1. One rough genuine Carborundum wheel
2. One fine genuine Carborundum wheel
3. One chisel grinding attachment
4. One twist drill attachment
5. One polishing spindle
6. One buffer
7. One polisher
8. One oil stone
9. One Carborundum hone in leather case
10. One Carborundum scythe stone
11. One foot power attachment

This outfit supplies every grinding, buffing and polishing need. The chisel and twist drill attachments make it easy for inexperienced persons to sharpen drills and chisels correctly.

A. Twist drill attachment to give drills proper angle and clearance.

Read what others say

Elmwood Haynes, of the Haynes Automobile Co., says: "I have found your machine a very satisfactory device."

MOST PRACTICAL GRINDER MADE

I received the Carborundum Grinder and am highly satisfied with it. I consider it the best and most practical all-purpose machine so far manufactured.

ALLEN STOODLEY, Goldfield, Nevada.

Bovee Furnaces at Manufacturers' Prices

Will Save You One-Half the Price and One-Half the Fuel

The Bovee is the only Furnace that has a Perfect Ventilating System for Every Part of the House

Don't compare our prices with small, cheap furnaces that do not have one-half the capacity. Measure the firepot, measure the combustion chamber, measure the compound circulating radiator. Note the long travel of heat before reaching smoke pipe. See why the Bovee Furnaces last longer, use less fuel and cost less in comparison with other furnaces of equal size and capacity.

SPECIAL PRICES

Three-Run Heating Plant for Residences

Including Pipe Registers and All Fittings

40-Inch Furnace

20-inch firepot, 28-inch combustion chamber. Heats 10,000 feet. Price..... **$65**

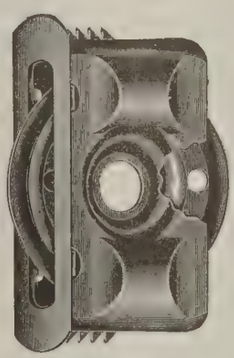
These Furnaces will carry from 5 to 8 pipes, which can be added at small cost when desired.

Store, Church and School Furnaces

One large run directly over Furnace and two cold-air plates, including pipe-registers and fittings.

54-Inch Furnace

32-inch fire pot, 40-inch combustion chamber, heats 40,000 feet. Price..... **$95**



Horizontal Furnaces, with equal heating capacity when desired. More heating pipes can be added at small cost. Prices on larger furnaces for any kind of buildings furnished on application.

THE COLONIAL SHINGLED HOUSE

NATIONAL BUILDER DESIGN No. 339

G. L. Warfield, Architect

For Floor Plans, Elevations and Details, See Supplement of This Number. Estimated Cost, Architect's Fees Not Included. $2,170.00

THE SUPPLEMENT PLAN

ON the supplement this month is shown an inexpensive house favoring in design the quaint Dutch Colonial style, emphasized by the gambrel roof at front and rear gables. Other attractive features of the exterior design are the porch across the entire front with its balusters, the large oriel window of the dining room, and the well-balanced arrangement of the windows throughout. The plan is direct and economical of space; the entrance hall is at the side, and is entered directly from the kitchen, avoiding passing through rooms to answer callers. At the left, opening from the hall, is the well lighted parlor, and back of this the dining room. The kitchen has set tubs, is well supplied with cupboards and has a special place for ice-box. On the second floor are three chambers of good size, each with two windows, and carefully planned wall space for beds. The bath room has the usual three fixtures. The house is shingled, and is one of the best in design and plan of any inexpensive home that has been published in this journal.

CARPENTER'S CURIOUS SIGN

A St. Louis carpenter, with a name fitting his occupation, has worked out a clever sign as sketched here. Under it appear the words: "L. Hammer, West End Carpenter and Builder."

The cornice is waving, Peggy, dear,
The gables all are ringing;
Why let me pine?—for, oh, you know
I'm sawdust when I'm singing!
—Nixon Waterman, in Saturday Evening Post.

Did you read all the advertisements that appeared in the February number of THE NATIONAL BUILDER?

* * *

If you did not read them, you do not know what you have missed! See and read all the advertisements in this issue, you will be the wiser and better for it—and it may be money in your pocket.

* * *

At this writing the fate of the reciprocity treaty, between Canada and the United States, hangs in the balance. If the treaty is accepted by the people of the two nations, it is reasonable to suppose that some grades of building materials will be somewhat reduced in price, though so far as we can discover, the reduction will be very little. The free admission of food stuffs, into the United States from our northern neighbor, will, no doubt, have a tendency to establish a lower cost of living, and this will be a boon for which we will have reason to be thankful.

* * *

THE NATIONAL BUILDER does not indulge in politics. It does not know one party from the other, or recognize in its columns, any party lines or party conduct, but like all impartial onlookers of passing events, it does feel—from its own point of view, that it knows a good thing when it sees it, and while the tariff treaty contains some things that certainly might be better for the country at large, as a whole, it will, if passed serve a good purpose and cause a lowering in the cost of living, though the lowering will not be of large dimension. It may also have the effect of causing—if passed—a slight reduction in the price of pine and hemlock, though we doubt it, as the price of rough lumber is now, in Canada, nearly the same as in this country. However, there are many places in the United States, near the boundary line, that will profit by the move, because of their proximity to the sources of supply, and there are many places in Canada that will be benefited in the same way because of their nearness to American lumber markets. Taking it altogether, the adoption of the proposed treaty, while not altogether an unmixed blessing, will tend very much to the benefit of both countries and will do away with many of those annoying and often objectionable features that disgrace the present methods of the customs officials of both nations.

* * *

Why build a monument to the memory of the late Stanford White? He was not a martyr to his profession by any means. Had he died in the pursuit of some real, or imagined advantage to his profession, or because of State or National opposition to his professional views, he might have some claim for a lasting memorial in stone or bronze, but under the circumstances, it were wiser to leave to his works—of which there are many—the duty of perpetuating his artistic qualities. So long as these works last, so long will the memory and fame of Stanford White remain, and like Wren, "His works will be the most fitting memorials of his greatness."

* * *

The practical workman, who has but little knowledge of mathematics, is often up against difficult problems when called upon to design structures requiring some knowledge of stresses and strains, and is occasionally thrown into considerable difficulties, for innate genius and rule of thumb are not always reliable guides in such matters. The less a man knows, the more he will guess at proper constructions, and it follows that some very wild guesses are formulated, and sometimes materialized in brick and stone and iron. Of two actual designs for the guide framing of a gasholder, both prepared by presumably "practical men," one would have weighed 128 tons, and the other 712 tons, a big difference.

In our editorial experience, we have often been called in to offer solutions of problems that sometimes bordered on the comic, both from the simplicity of the solution, and because of the manner in which the problem was laid before us. In many of these problems the solution did not depend on mathematical attainments, but rather on a simple knowledge of the "fitness of things," and a slight acquaintance with the first four rules of arithmetic; something the ordinary workman generally understands; or should, and if he does not, he should set himself to work to master, which he can do if he applies himself to the task earnestly, an hour or two each night for a month.

* * *

The practical man, while all right, is apt to be too conservative in his notions. He lacks imagination; what has been good enough for him, and for his father before him he thinks, should be good enough for you. He lacks that vision which is "the art of seeing things invisible," and from the fact of his energies having been so much concerned with hard facts as to stunt his development on the speculative and poetical side of life, he is often narrow-minded. It is such as he who, when called upon to ventilate a quiet little country church, amid a peaceful surrounding of trees and cornfields, blasts its beauty by surmounting the roof with hideous torpedo-shaped monstrosities of sheet iron, or perches on its ridge, a barn-like louvre, which, while effective as a ventilator, destroys the beauty of the rural building. The practical man, however, has an important place in the world's economy, and we could better do without the artist than without the man who knows how to do things—and does them. A good education is a priceless asset for any person to possess, but it does not follow that because a man does not have a college education, he cannot become a first class workman or an excellent architect and designer. Some of the cleverest designers we have known, never traveled on the paths of learning beyond the threshold of a public school; while a few of the most incompetent and stupid artists—so called—we ever met, were college bred. This, however, does not argue against the benefits of a thorough education. Man should, and does, continue to learn and improve so long as his life and intellect stand by him.

* * *

Unfortunately, in these days there is a tendency to display too much learning in the writings given out for public instruction than is necessary. Whole pages are covered with mystic symbols and discouraging formulæ, and the ordinary working man becomes dismayed by the formidable array, and leaves them undisturbed in their mysteries. The absurdity of attempting to carry mathematical statements to such a pitch of refinement, arises from two considerations. First, we do not know all the necessary factors with anything like accuracy, and a wrong assumption in any one factor vitiates the whole calculation. It is like trying to make mince-pies when we are not quite sure whether a certain white powder is sugar or carbonate of soda. The result is doubtful—it may come out right or it may not. Secondly—too much reliance is placed on the value of constants which have been copied year after year from one text book to another, and in the first instance may have been based on very inadequate experiments. For example, the formulæ for the strength of wooden columns were until recently, copied from text book to text book, with perhaps, some variation in the mode of statement, but all based on experiments made in 1840 on seven pieces of wood cut from one plank, the largest pieces used in the experiments being about two inches square and five feet long. If a few sticks from another plank had been used, how would the constant have turned out?

* * *

One of the besetting weaknesses of the theoretical man is his assumption of a superlative exactness in matters which do not admit of a nicety or mathematical definition. A wire-edged precision binds all his thoughts and notions, however trivial. He is like the witness who stated that the prisoner at the bar said, "My dear Thomas—or words to that effect." In our younger days, one well known text book on constructional ironwork worked out many calculations for riveted joints to the fourth place of decimals of an inch. Rankine, an old and valued mathematical high-priest, in dealing with certain hydraulic questions, gives a table of heights in feet due to certain velocities, and is careful to say that they are calculated for latitude 54¾. Visits to engineering and municipal works are very excellent things in some ways, but as a means of acquiring a full knowledge of, say, the Brooklyn Bridge or the Hudson River tunnels, a few hours spent in inspecting these works would not be half so effective as a perusal of the special issues of the engineering papers, with their multitude of illustrations and exact figures.

A SAMPLE SPECIFICATION

By S. CHARLES, C. E.

GENERAL CONDITIONS.

The entire work to be executed under the direction and to the entire satisfaction of the architect, or his representative, and in conformity with his instructions and such scale and detail drawings as may be furnished from time to time during the progress of the work.

The contractor shall give his personal superintendence to the work, or shall have some competent person on the work, at all times, to act for him, and shall furnish all materials, labor, scaffolding, etc., necessary to complete the work, according to the true intent and meaning of the drawings and these specifications, of which intent and meaning the architect, or his representative, shall be interpreter, and his decision, in any and all cases, shall be final and binding on the contractor.

The location of the building will be indicated by the architect, and should be examined by the contractor before bidding.

The contractor must lay his own work out correctly and will be held responsible for all measurements. Where no figures or memoranda are given, the drawings shall be accurately followed, according to this scale, but figures or memoranda are to be preferred to the scale, in case of difference. In any and all cases of discrepancy in figures or drawings, the matter shall be immediately submitted to the architect, or his representative. for decision, and without such decision, said discrepancy shall not be adjusted by the contractor, save only at his own risk; and in the settlement of any complication arising from such adjustment the contractor shall bear all extra expenses involved.

The contractor must, wherever it is necessary, furnish the services of a competent and approved engineer, to lay out the work and establish levels, using the datum lines as laid down on the drawings.

It is intended that the drawings and specifications include everything requisite and necessary to the proper and entire finishing of the building, notwithstanding every item necessarily involved by the work, is not particularly mentioned, and all the work when finished, to be delivered up in a perfect and undamaged state.

The drawings and these specifications shall be considered as co-operative, and the work or material called for by the one and not mentioned in the other, is to be done or furnished in as faithful and as thorough a manner as though fully treated of by both.

The contractor must furnish the architect with a list of the sub-contractor's with whom he proposes to contract, before commencing the work, and will not be permitted to contract with any parties for the performance of any proportion of this work without the consent of the architect, and no sub-contractor will be recognized in any other capacity than that of an average employe of the general contractor.

The architect, or his representative, may require the contractor to dismiss such workman as they deem incompetent or careless, and he is to have at all times, access to the work, which is to be entirely under his control.

The contractor will be held responsible for all damage to the building, whether from fire or other causes, during the prosecution of the work and until the work is accepted. He shall be held responsible for all damage that may occur to persons, animals or vehicles, for want of proper lighting, boarding, watching, or enclosing, or any accident arising from defective scaffolding, or any negligence on the part of himself or his employes.

Except it be otherwise specified, all materials are to be of the best quality of their respective kinds, and all labor to be done in the most thorough, prompt and workmanlike manner, to the full satisfaction of the architect, or his representative.

All drawings and memoranda relating to the work are the property of the architect and are to be carefully used, and returned at the completion or cessation, from any cause, of the work.

The contractor shall render all assistance to the other mechanics in every way in which his special work can be of service and such assistance shall be given promptly and thoroughly and without additional charge. The work shall be carried on systematically and shall be so managed by the contractor, at all times, as to secure rapid progress and avoid annoyance and inconvenience. The contractor and his employes must work with harmony with other contractors on the grounds.

The contractor must remove all rubbish at the completion of the building.

Building permits are to be obtained, and paid for, by the contractor; also the necessary water during the course of construction.

EXCAVATION AND GRADING.

The contractor shall clear the site of the building of all dirt or rubbish, and excavate to the proper depths for all footings as shown on the drawings. All trenches to be the exact width of footings, and any trenches too deep must be refilled with concrete. The tops of all footings to be at least 3 feet 6 inches from the finished grade.

As soon as the footings, pipe lines, etc., are in place, inspected and approved by the architect, all trenches are to be refilled, and any earth not required shall be removed from the premises unless otherwise ordered. All backfilling shall be thoroughly tamped every 8 inches.

The cellar floor shall be excavated to a depth of 6 inches below the finished wood floor, also all areas.

CONCRETE WORK.

All walls to have concrete footings of dimensions noted on drawings, mixed to the proportions of one part Portland cement of approved brand, to 2½ parts clean sharp sand, and five parts of broken stone, in cubes not larger than 2 inches, thoroughly incorporated with a sufficient quantity of water and laid in the trenches in two different layers, gently ram all concrete until the water rises to the surface, care being taken to avoid premature setting of the cement.

Reinforced footing shall be as specified above, and size of steel bars as noted on the drawings.

The whole of the floor surface of the basement except as noted, to be properly lined and rammed and covered with 4 inches of concrete composed of one part of Portland cement, three parts sand and six parts broken stone as described above, and to be covered with mosaic, or cement finish, as may be required. Areas, boiler room, and other places call for to be finished with ¾-inch cement capping composed of one part Portland cement and three parts sand.

Where wood floors are required for basement they are to be constructed as follows:

First, level and ram the earth, then cover the same with 2 inches asphalt concrete composed of pitch, asphalt sand and fine ashes, rolled down to 1¼ inches, then place in sleepers—Georgia pine or spruce, 2x4 inches, beveled to the true level on same and then fill in between same with a course of asphalt concrete, as called for above.

STONE WORK.

All stone must be sound, strong and of a homogeneous character, and where exposed to view must be free from stains or discolorations.

All exterior walls of basements, as indicated on plans, from concrete footings up to height of first water table, to be of Potomac blue stone or such other stone as may be approved of by the architect.

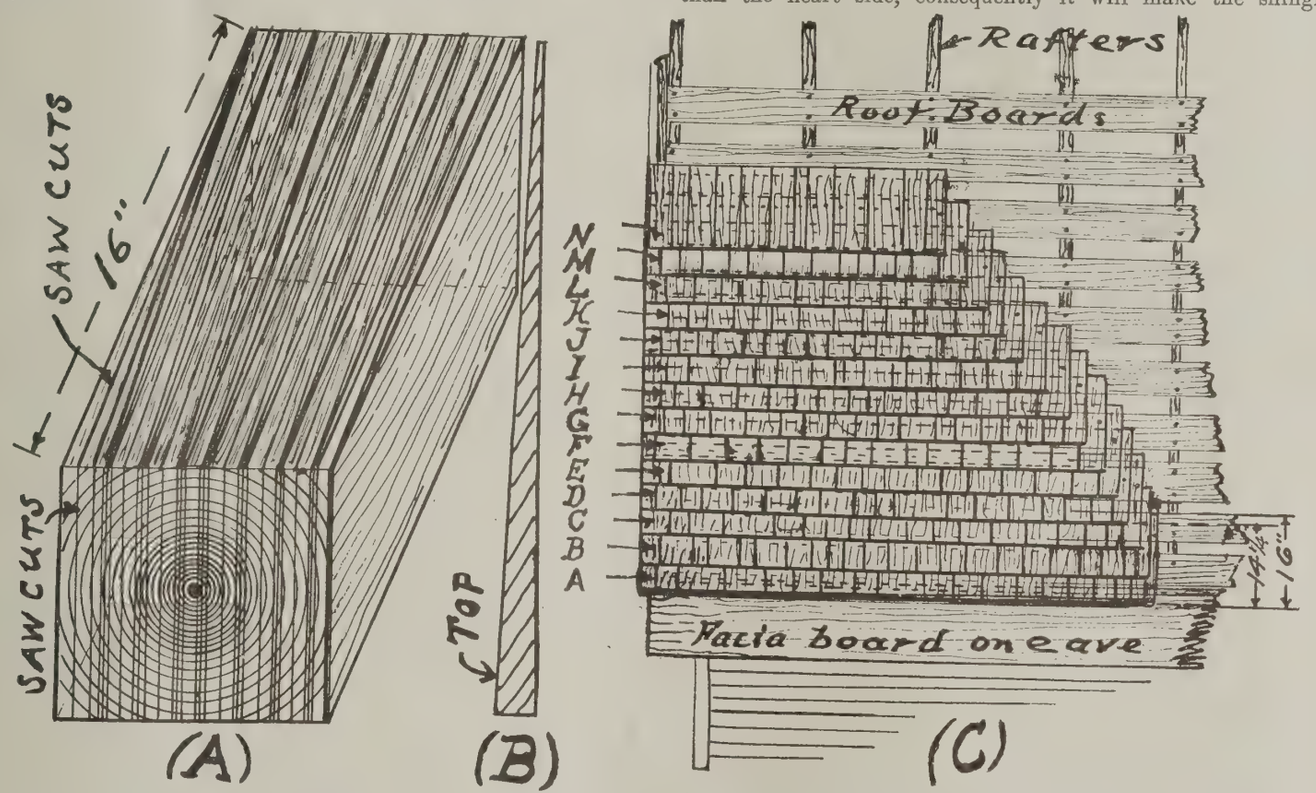
All walls to be laid in Portland cement, mortar, one part cement three parts sand, to all sides above and below ground. All work below the surface of the ground and back of exterior walls to be of rubble masonry, well scabbled, solidly bedded, laid on natural bed with close joint. Joints below ground to be weathered to throw off water. Interstices to be filled solid with stone chips bedded in mortar. Bond stones to be placed at frequent intervals and corners. Jambs and angles to have extra size stone, thoroughly interlocked. Walls to be built perfectly plumb and straight and to true lines and leveled up with large size stones, to receive the floor joists.

The mason must build all channels and leave apertures where required by the steam fitter and plumber throughout the job, and insert as the work progresses all bolts, anchors, plates, lugs, back sills, lintels, wood, bricks, etc., necessary for the various trades, and all cramps, dogs, etc., deemed necessary by the architect.

(To be continued.)

Ordinary floor varnishes or linseed oil will produce darkening. Mineral oils are less likely to darken wood than linseed oil, but are not to be considered in dwelling houses or public halls in floors, because of their tendency to soil the dresses of ladies.

THE LIFE OF A SHINGLED ROOF



By S. A. C.

THE question is asked many times, "How long will a shingled roof last"? The answer depends very materially upon the grade of shingles used and the workmanship employed in laying them.

A first-class shingled roof should last at least twenty years; in fact, the writer has known of roofs that have stood for thirty years without requiring very much repairing, however, the shingles were first-class when put on and were properly laid.

Many suppose that all there is to shingling is to lay one course on top of the other, showing 4 to 5 inches to the weather, as the case may be, so that the joints will not come directly over each other.

This is a very erroneous idea, in fact there is considerable skill required to do a good job of shingling. The great trouble seems to be that carpenters do not take sufficient time to do a good job, or the contractors do not allow the time.

STANDARD SHINGLES.

Standard singles are 4 inches wide, 16 inches long, and about ½ inch thick at the butt, tapering to about $\frac{1}{16}$ inch at the thin end; a shingle 8 inches wide would have two shingles in it. Shingles are put up in bundles 20 inches wide, 25 courses thick at each end of the bundle with the thin ends lapped and bound together, 250 shingles in each bundle, 4 bundles to the M (thousand).

FIRST-CLASS SHINGLES.

First-class shingles should be sawn from good sound clear body timber (cedar or cypress), sawn parallel with the grain of the wood. Referring to the illustration, (A) shows a shingle block ready to saw into shingles; it will be observed by the lines indicating the saw cuts that the block is reversed every couple of shingles, so as to cut the butts from opposite ends, in order to keep the shingle cutting with the grain of the timber.

(B) shows the edge of a shingle that has not been cut parallel with the grain of the timber; this makes a very poor shingle, as it will split obliquely across the shingle with the way the grain runs; if this shingle is used at all care should be taken to lay it with the side up as indicated, top. In the writer's opinion kiln drying does not improve the lasting qualities of shingles; he would prefer them air dried.

A WORD ABOUT LAYING.

(C) shows a portion of a roof, with fourteen courses of shingles lettered A, B, C, D, E, etc. The double course, A, is laid first with joints broken at least 1 inch; course B is then laid, showing in this case 4¾ inches to the weather, which gives three laps to each 16 inch shingle, and 1¾ inches to spare. The joints in course B should not be placed so that they will come over the joints in the under course in A; then proceed with courses C, D, E, etc., taking care to not only break the joints in the course directly under, but also that the joints in course D will not come over joints in course B, joints in course E over joints in course C, etc., etc., for the reason that should joints in courses B and D be directly over each other and a shingle in course C should split in line with them, you would have a leak. Nails should not be driven so hard that the head will sink into the shingle, as shingles are subject to more or less shrinkage and swelling with the weather; if the nails are not driven too tight they allow for a little play and are not so liable to cause splits.

Another thing the shingler should watch is to lay the shingle with the heart side down; the bark sides will shrink more than the heart side, consequently it will make the shingle lay closer to the roof, but if the heart side were up it would be more likely to curl and split. Shingles over 8 inches wide should be split in two before being nailed on. More than two nails should never be put into a shingle, as very wide shingles are liable to split where the nails are driven from the shrinkage and swelling. For shingles 3 inches wide and under one nail is plenty; the nails should be driven so that they will cover about one inch, with the next course above.

If the shingler would use a little more judgment and care, shingle roofs would rise to the rank they deserve. In most cases when leaks occur the shingle roof is blamed for it, while really it is the don't care system of laying them that is to blame.

He scoffed at lawyers, called them rogues,
Said all were steeped in sin;
But, being caught at breaking laws,
He called six lawyers in.

He said the doctors all were quacks,
Who practiced cunning tricks;
But when a fever struck him down,
He sent for five or six.

He scorned the preachers, called them fools;
But on a certain day
He thought his time had come, and called
Three preachers in to pray.—Judge.

AN INGENIOUS PUZZLE CONSTRUCTED IN WOOD

By W. J. HORNER

THIS puzzle consists of a box, shown in Figs. 1 and 2, and four blocks of wood to fit inside it, shown in Figs. 3 and 4. These blocks are numbered, as seen in Fig. 4, and the person who understands the puzzle asks someone to place one of the blocks in the box and put the cover on, without telling which is in there. The box may then be laid on the table, either side uppermost, and the person who knows the trick tells at a glance, without touching the box, which of the blocks is inside. As it is obviously impossible to see anything of the block, much less the number written on its face, it looks to the uninitiated like thought-reading, and the way it is done seems an utter mystery, and undiscoverable after the most careful examination of the box and blocks.

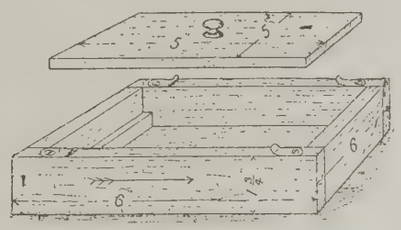


FIG. 1.—General View of Box and Cover.

The explanation is as follows: The blocks are loaded with lead or other metal in the interior and towards one edge, as seen in the cross-section, Fig. 2, where a block is inside the box, and by the dotted rectangles in each of the blocks in Fig. 4 This lead is completely enclosed, and not visible, or its weight noticeable, from exterior examination of the blocks. The box has an ornamental knob at top and bottom, as seen in Fig. 2. The box consequently cannot balance, but when resting on the

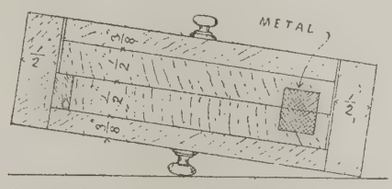

FIG. 2.—Section Through Box with Block Inside.

knob must tilt, as in Fig. 2. The side on which the block inside is loaded, of course, decides which way the box will tilt. It tilts a different way for each of the blocks, because, as seen in Fig. 4, the loading of each is in a different direction. A strip fitted in one end of the box, seen in Figs. 1 and 2, and a corresponding amount removed from each of the blocks, insures their always being placed in the box in one position only. The arrow shown on the exterior of the box in Fig. 1 is sufficient guide to tell the number from the direction of the tilt, and it is quite meaningless to a person not understanding the puzzle. The arrow may be taken as No. 1 side, and the other numbers proceed in

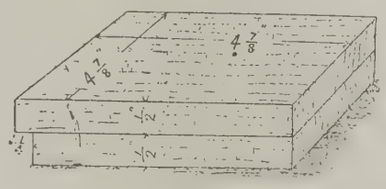

FIG. 3.—Perspective View of Block.

the direction of the arrow, 2 being at the adjoining side to the right as the box appears in the sketch, 3 on the far side, and 4 to the left, next to the arrow again. This reads equally well, no matter which way up the box stands. Numbers on the sides of the box would arouse suspicion, and probably lead to the solution of the puzzle.

Suitable dimensions for the parts are figured on the illustrations. Yellow pine or other very light wood should be used, so that the metal shall decidedly overbalance the wood. With a heavy wood, a relatively large amount of metal would be necessary to make the direction of tilt unmistakable. The construction of the box can be seen in Figs. 1 and 2, and hardly needs any explanation. It is nailed together with the bottom piece between the four enclosing sides. The four buttons for securing the cover may be of metal or wood. Those illustrated are simply bits of sheet tin, cut out with shears, and turned up a little at one end. A screw-hole is made in each end with a punch. If preferred, the cover could be hinged, and fastened on the opposite side to the hinges with a hook and eye. The cover then would have to be the full exterior side of the box, and for uniformity the bottom should be the same. The interior depth of the box would then correspond with the thickness of the blocks, instead of including the cover as well.

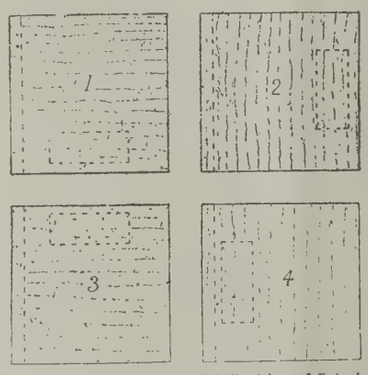

FIG. 4.—The Four Blocks with Position of Interior Metal Indicated by Dotted Rectangles.

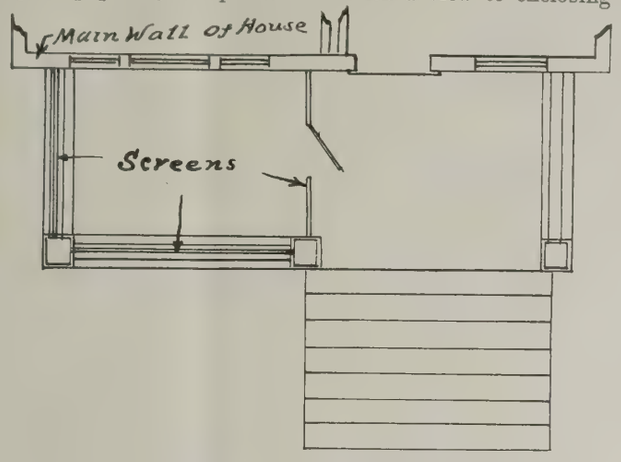
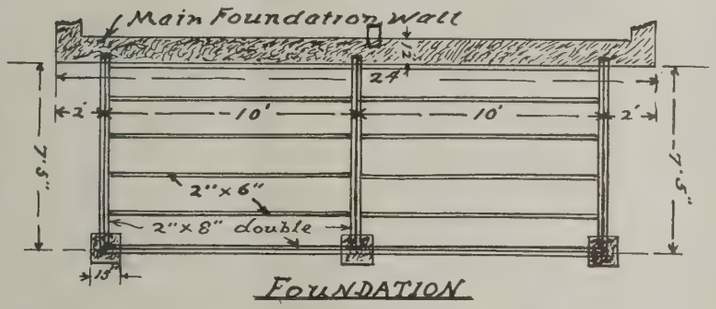
The blocks are made of two pieces, for convenience in inserting the metal. These pieces may be nailed together, one being ¼ in. shorter than the other, as seen in Fig. 3, to fit the strip inserted in the box. Without this there would be several different directions in which the block might be turned, so making the working of the puzzle impossible. Before the halves of the blocks are nailed together, recesses for the metal are cut as seen in Figs. 2 and 4. Soft-solder might be melted and poured into each half separately without burning the wood seriously. If lead is used, it should be cast in blocks first; or sheet or scrap lead might be cut and fitted to fill the recess. Suitable scrap iron might be used, the recesses in the wood being cut to fit it. The metal should be as close to the edge of the blocks as possible. The blocks should measure about ⅛ in. less than the inside of the box, so that there shall be no possibility of their fitting too tightly and causing trouble in putting them in or taking them out. The knobs on the bottom and cover of the box need not necessarily be like those illustrated. Round-headed screws might be used instead, or small square blocks might be made and nailed on, with their tops beveled in each direction from the center.—The English Mechanic.



INLAYING

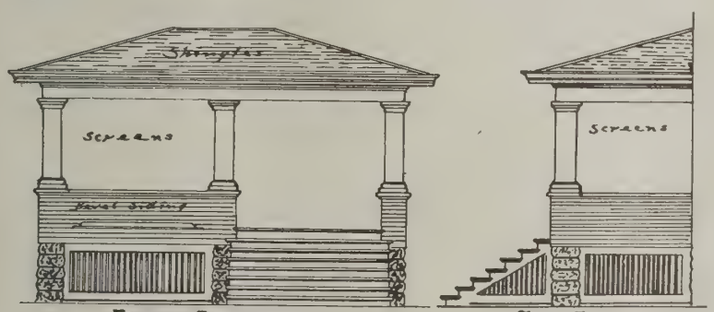
EVERY one has noticed that in ordinary inlaying there is a very ugly glue joint, equal in its width to that of the saw used, which runs round the whole of the inlaid pattern. This, of course, looks bad, and further, it involves the use of a very fine saw to reduce the width as much as possible. This, again, involves the use of comparatively thin wood. To avoid this, tilt up the saw table a little on one side—say the right. With it in this position cut out the right side of a letter—say a capital I. Obviously the uppermost of the two pieces of wood on which we are operating would have its I slightly broader than the bottom one. Then finish the letter, being always careful to make the cut "sun about," as the phrase is; i. e., in the same direction as the hands of a clock move. We now have an I cut out of the top piece slightly broader and longer than that cut out of the lower one. If we have proportioned the amount of "tilt" of the table with due regard to the thickness of the saw and of the wood used, the upper I will just fit neatly and tightly into the space left in the lower piece. Apply plenty of glue and gently tap the letter or monogram into its place, and we have a glue joint which will be barely visible. The amount of slope required in the table is very slight, and one soon finds out the happy medium.



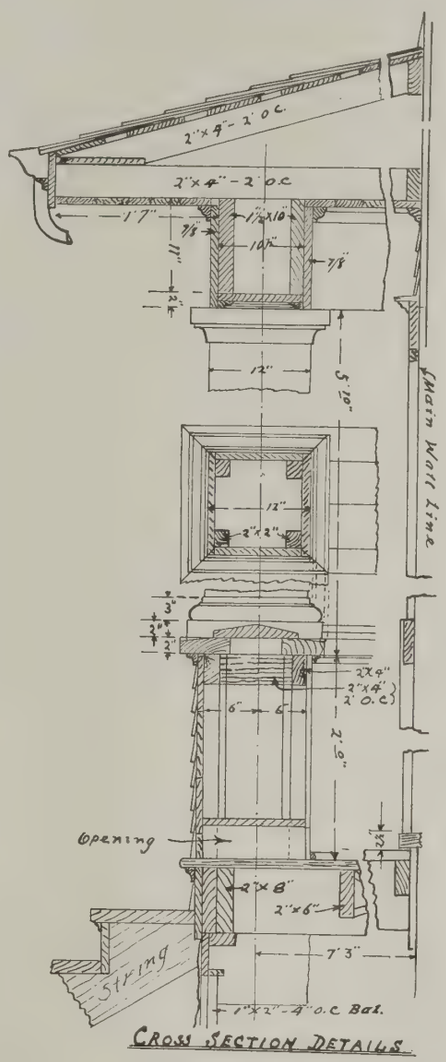
BUILDING THE HOME PORCH

By WM. C. A. STEVENSON

WITH the approach of another spring home owners will begin to plan their homes to enjoy outdoor life as much as possible. The idea of sleeping out of doors is becoming quite popular; the porch built with a view to enclosing with



FIRST FLOOR



FOUNDATION

screens in summer and glass in winter affords a very desirable adjunct to the home.

FRONT ELEVATION END ELEVATION

The porch illustrated herewith, showing the foundation and porch plans, the front and end elevation, and cross sectional

CROSS SECTION DETAILS

details, is one the writer is about to build for a customer and offers a good example.

As the drawings are self-explanatory it will not be necessary to dwell on the construction details for this porch. The cost would range from $130 to $200, depending upon local conditions.

SPRING BUILDING AT A LOSS

E. P. HOERR

NOW that spring season is on, with building contracts ready to be let, we will learn of contracts being signed at about a cost basis. The successful bidder started out with the determination of getting the first job, and to do so it was necessary to cut the job. But on what kind of a basis? We venture a guess that most first spring jobs are secured on a basis of cost or at least so near to it as to give the contractor little or nothing for the troubles and chances taken to complete the work. And he could have secured more.

Let us say that this is all foolish. The "cut throat" way of getting work is just as harmful to Mr. Successful Bidder as to the various Mr. Loosers. It seems to set the basis for future contracts, since the unsuccessful bidders feel that the basis set on the first job by the successful one is the basis on which he will figure the other jobs.

Of course, we must not overlook the fact that one contractor's cost may not be the cost of the next contractor. Different men work differently. One Contractors men may work together better, thus making a lower pay roll. His buying plan may be different. The subcontractors' men may work better with his men; this saving time and hastening construction of the building; for nothing gives greater profit to a contractor than a job quickly constructed.

Its part of the game, of course, to be able to construct cheaper than your competitor, but then too, why not get a little more for your knowledge and abiliy. Instead of adding the regular percentage as your profit, be brave enough to add a few points more, for even one per cent more on a $5,000 job means $50. Suppose you do lose a job. Has not your competitor a right to some work? If you were to get two jobs in succession, it follows that the third contract "goes for a song." They begin to get hungry. Then you begin to suffer on the jobs that follow, for a pace has been set and you must hump if you want to keep in the race for future jobs.

In this article (THE NATIONAL BUILDER), is prompted to give advice to its great army of contractor readers. There is no desire to start a crusade for higher cost of buildings, yet its only too well known that the construction business is not a big money making proposition. The competition is keen.

It might not be amiss to add that your cost can in many cases be reduced by taking advantage of the advertising columns of this paper.

CHANGES OF STYLE

By WARFIELD WEBB

THERE is ample reason why the builder should keep in touch with the changes that are being made in the styles of both interior and exterior finish in house construction. This demands more than merely noting the varying improvements; it demands the ability to conform to the requirements that are demanded of a man who is capable of doing the actual work of constructing them, and this in a way that will bring credit to himself and his industry. There is art in doing the most commonplace things well, and driving a nail with accuracy is just as much an essential to a good workman as in designing a house. If the little detail is not looked after with care there will be no possible reason to hope that the larger undertaking will be any more worthy of commendation.

With the building conditions undergoing so many changes as they have in the past few years, it behooves a wide awake builder to keep abreast of these changes, and to be prepared at a moment's notice to do any work of an improved nature that may be demanded of him. It is true that there are still in vogue a certain number of standard sizes in doors, frames, sash, blinds and kindred specials, but there are likewise a larger number of particular designs, calling for more intricate labor and a far greater knowledge of careful workmanship. Unless the carpenter is equipped with the required knowledge to do this newer work well he is placed at a great disadvantage. If he endeavors to do this work without the proper knowledge then the result will be only a failure, or a job that is sure to be just cause for complaint.

The particular workman will devote a certain amount of his spare time, and every man has some time that he may call his own, to a practical improvement in this way. He best knows his own defects, and if he is ambitious to progress he will utilize this spare time in making it profitable for the future. Faulty construction is so common that there is ample reason to see on every hand inferior work. Have you ever noted the defects in a structure that were the result of careless or sometimes ignorant workmanship? They are on every hand, and they could have been avoided had the builder or contractor been at all conscientious in his work.

Hanging a door, or blinds, may seem a simple thing, and so it is to the man who looks at it from the proper viewpoint. Placing siding on a structure, framing a roof, erecting studding are all simple forms of carpentry work to the man who has studied out the details of his plan and the little nicities in advance of his labor. We can easy enough see our errors when we have made them and they have been pointed out to us. It is almost as easy to see them before they are made when we are particular about the work we do.

The poor workman is always looking for a job. He soon becomes known as such, and he is shunned by the particular contractor with good reason. If you are in this class make a careful study of the defects in your work and make it a rule never to make the same error the second time. It is so easy to do our work in a manner that will merit us a bad name. Care demands study, it demands hard work, and it calls for the serious thought that will cause us to study the plans that lie before us fully before we undertake a simple operation.

With the acquirement of accurate knowledge we must needs have good tools to work with, otherwise it will be far more difficult to do so and attain the desired end. Then there is the error of trusting to your eye to measure up where a plum should be used. If you place a window frame in position, erect floor joists, hang a door, there is need for accuracy. How will you do these things right when you trust to your eye, and not to the more certain accuracy of the plum?

See that each slight detail is correct before proceeding with another. This is the only sure method to avoid errors. When you are absolutely certain that you are right then proceed to make further headway. If you are going to guess, then there will be the natural consequence of guess work, which is, nine out of ten times, wrong. The builder who guesses is the man who is always on the lookout for a job. There is also the advantage of a man who has the proper idea of progress in mind of making headway in other respects. The jobbing carpenter in this age is not the man who is in demand, but there are times when it is very handy to be able to turn your labor to good account by doing something, in a creditable way, that is not, strictly speaking, just to your line of special work. It sometimes happens that there is a dearth of such men as are capable of only doing a few things well, or that the amount of special work is not large. Such times do come and if a man is able to devote his time to other pursuits, it will be a very profitable way to make a few dollars in odd times.

In any event do not undertake any work that you are not sure of being able to accomplish with due credit to yourself. A poor piece of work will be the worst possible asset for you in time of need when there is a demand for able men. The one mistake you have made may be the means of costing you an opening that will merit for you a much greater reward than what could be realized from a contract undertaking that netted you only disfavor with your employers.

THE HAND SAW

THE hand saw is the constant companion of the carpenter. There are a few other tools he carries incessantly, the hatchet and the square, but aside from these and even with these, the hand saw is probably the most useful tool in his kit, and most often abused.

Some carpenters are one saw carpenters. That is, they are men who have one favorite hand saw that they use for everything, for heavy framing, for cutting weather boarding, for cutting inside finish. Again, there are others who have a different saw for every kind of work.

It is these men, these latter, who generally get the best results and take the best care of their saws. In the hand saw as in a mill saw it should be adapted to a peculiar class of work. A good framing saw will cut weather boarding, but it will not do as nice a job as a finer toothed saw. Neither will the fine toothed saw used for cabinet work and finish make as good headway cutting heavy framing.

Some men vary their saws according to the work they have to do by different degrees of coarseness in their teeth, and also in their length.

There are some men, tall and lankey, with long arms, who want a framing saw at least two inches longer than the average saw, so as to get the benefit of the full stroke, and often these very men when they get to cutting mitre joints or weather boarding want to use a saw from two to four inches shorter than the average, with very fine teeth.

We may take it that the main division or variation for the class of work should be by the teeth and the thickness of the blades. For framing use saws with coarse teeth and comparatively heavy blade. For weather boarding fine teeth with a thinner blade, and for some interior finish one may use even a finer tooth blade than for the weather boarding, with a blade reinforced with a stiff back.

The disposition now seems to be to use saws with a few more teeth to the inch than formerly. There was a time when the favorite framing saw had from five to seven teeth to the inch whereas today it runs from seven to nine. Formerly the weather boarding saw had from seven to nine teeth to the inch whereas today they run from nine to twelve.

It is not always this way, because people have different ideas. As stated above some people use practically the same saw for everything about a house and others have a wide variety. A different saw for every kind of work and generally they keep it filed and in shape especially for that work.

This is the way to get the best results. Make your work into a series of divisions, at least three of them, and have saws for each division of work. Then keep them fitted up especially for doing that work. It will take a little more time and a little more attention and call for a few more tools in the end, but there will be enough gain in both quantity and quality of work to pay for it.

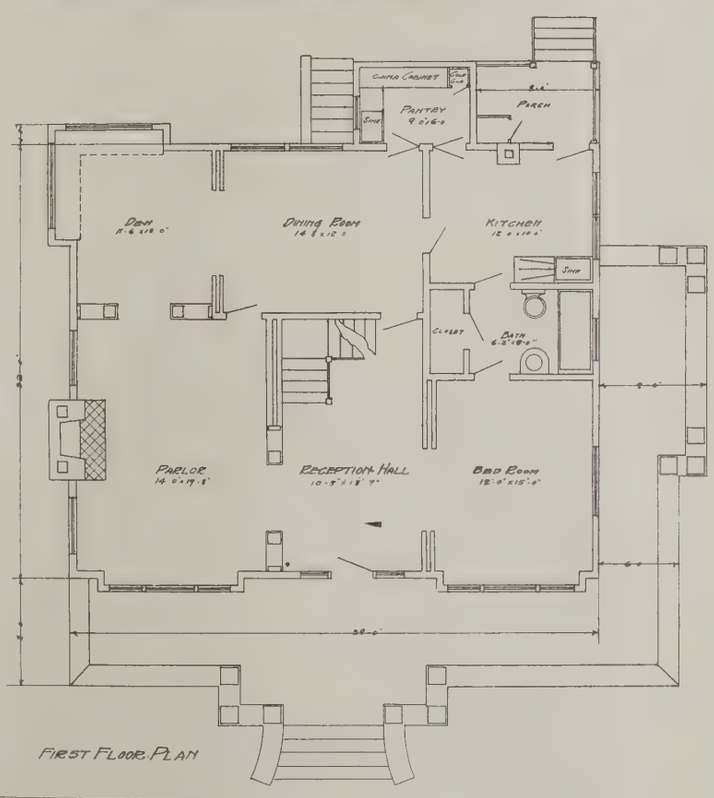
In short, the hand saw, which is the best side companion of the carpenter, generally gets too much abuse and not enough appreciation and care. It is filed in a hurry, often carelessly and poorly, is used roughly by some, is kinked, and is left out and allowed to rust and gets more rough treatment considering its qualities than any other tool.

The best way to create a live interest and insure better attention for your saws is to start in by buying the best kind of saws you can find, selecting them carefully for the use you have. Then having a saw that you are proud of in the beginning you will likely take better care of it as you go along.

BUNGALOW IN ORIENTAL STYLE

This bungalow, designed and built by H. S. Wright, Everett, Washington, for E. A. Roberts, presents something out of the ordinary particularly as to roof effect. In spite of the many curves and steep pitches there has been worked into this bungalow a considerable amount of room on the second floor; a fact which is not apparent from the cut.

Built upon spacious grounds, with broad verandas on two sides, it attracts immediate and favorable attention. There is a full excavated basement under this house, which adds that much more room to the whole.



The first floor plan is carefully worked out and is, obviously, an extremely convenient home.

Upon entering there is a spacious reception hall, with the stairs to the second floor leading up from the back.

All parts of the house are accessable from this reception hall; the living room to the left, a bed room to the right and the dining room to the rear. The pantry is reached directly from either the kitchen or the dining room.

This bungalow was designed primarily that the first floor should furnish all the necessities of a home, the second floor being merely reserve space; hence the bathroom is located on the first floor and is accessable from either the kitchen or bedroom. There is also a second bath room on the second floor. This bed room is shut off from the reception room by sliding doors, so that it may be used as a library, if desired, in which case the second story bed rooms are at once available.

Access to the basement is had by one stairway leading from the reception hall under the second story stairs and by another stairway leading from the rear of the house, out of doros.

FIRST FLOOR PLAN

Prior to the last election Chief Justice Potter of Wyoming made a tour of the state in company with other Republican candidates. In a small town he was called upon by the chairman to address the people at the end of a lengthy program furnished by the not too gifted orators of the evening.

"Ladies and gentlemen," he began, upon arising, "the speakers who have preceded me have so thoroughly covered the ground that I hardly know what to talk about."

As he paused a stentorian voice in the audience suggested:

"Talk about a minute."—Lippincott's.

Not long ago there was held in a New England town an exhibition under the auspices of an "ancestral loan society," and among the proud exhibitors was a spinster, who showed several fine portraits of her great-grandfather, an officer in our revolutionay war. A friend was remarking to the spinster that she seemed proud indeed of her valiant ancestor. "A brave man!" exclaimed the friend.

"Brave!" repeated the descendant of the great man. "I should say he was brave! Why, he took part in over fifteen engagements, and there was hardly one in which he didn't lose an arm or a leg or something!"—Lippincott's.

TESTS ON AMERICAN AND ENGLISH OAKS

By J. W OVEREND, A. R. SAN. I

IT DOES not usually come within the practice of the everyday builder to know precisely the strengths of the timbers which he may be using, this being left to the various universities or technical colleges to experiment on same, and the results of the various stresses a beam will stand is handed down to the different engineers and contractors, through the various trades papers or by other channels. For timbers the most important is the transverse stress, or the resistance a beam offers to breaking when loaded anywhere in its length. A very important point in testing is that the degree of moisture in the material should be carefully considered. For testing this, a very simple method is as follows: Bore holes with the brace and bit right through the timber under consideration, weigh in the first state and then drying in an oven, afterwards weighing again, the percentage of difference being taken as the degree of moisture present in the timbers.

The formula used and recognised for beams center loaded is as follows:

$$BW = \frac{bd^2c}{s} \text{ where}$$

BW = Breaking weight in terms taken for the constant, and load concentrated at center.
b = breadth of piece in inches.
d = Depth of piece in inches.
c = Constant found by experiment by placing a piece of wood 1 inch square over a span of 1 foot.
s = Span in feet.

—TRANSVERSE TESTS.—

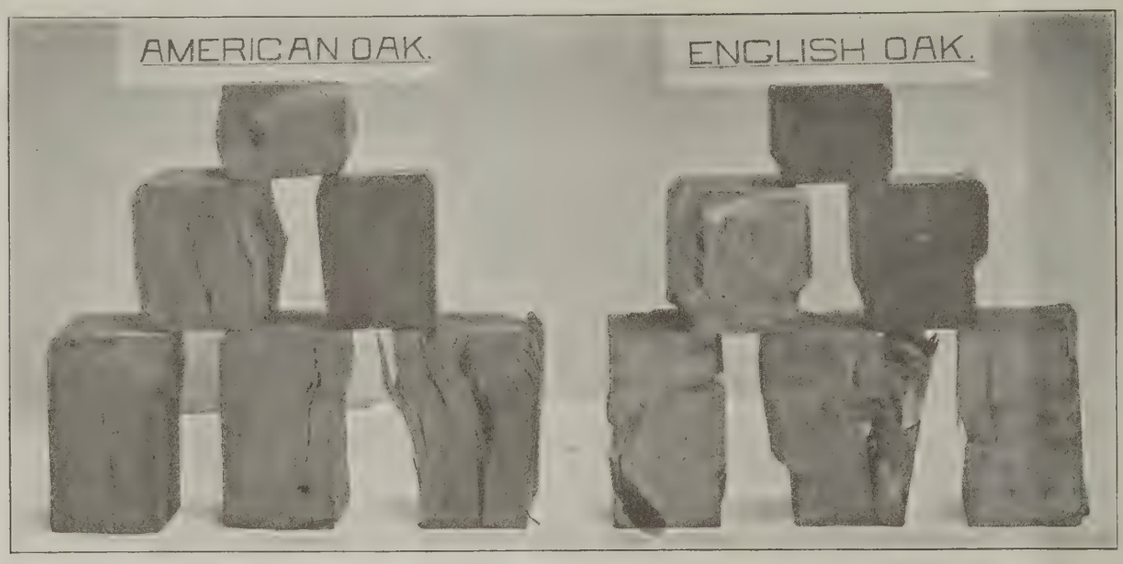
TABLE NO. 3.



It should be noticed that the actual practical results are considerably below the results given by calculation and the values given in text books. This was due to the fact that the timbers in all 3 cases contained an abnormal amount of moisture which would of course have been removed by more complete seasoning. Photo No. 1 shows the views of beams after experiment and the nature of the strain. Table No 2 shows the deflection curves which is self ex-

of compressional tests. To arrive at approximate result it will be noticed that a series of pieces was tested and then the average was taken. Notice should be taken of the moisture contained in the pieces which affected the results.

Table No. 5 and Photo No. 6 illustrates the results of detrusion or shearing tests. Again in this case the average should be taken.

Table No. 6 and Photo No. 6 illustrate the results of a series taken for tensile tests. The average again should be taken of the results attained.

So many factors enter into the testing of timbers that in order to arrive at some approximate results a series must be taken and averages taken. Single experiments are almost useless.

TABLE NO. 6.

SHINGLED HOUSE FOR CHARLES HOFFMANN, RIVER EDGE, N. J.
WILDER & WHITE, ARCHITECTS, NEW YORK CITY.

COST ON A SQUARE FOOT BASIS

E. P. HOERR

EVERY now and then we hear of a Contractor and Builder who estimates buildings on a cubic foot basis, basing it on the cost per cubic foot of a job he had previously built.

We are rather inclined to doubt the wisdom of estimating in this manner, for there are bound to be so many points at variance in the different buildings. These differences are, of course, considered, but is it not rather too much "guess work" to add or deduct here or there for these differences?

Let us suppose for instance, that a contractor kept close cost on a house just built by him; say it was a frame building 26 feet wide by 32 feet deep with gable style. The studs and joists were of yellow pine, likewise the sheathing and under floors. The foundation was of concrete, the cellar floor being also concreted. There were two porches front and rear, of concrete and wood. The interior finish was of plain red oak throughout, with plenty of cabinets, bookcases and mantels. The top floors were also of oak corresponding to the finish of the rooms. The cost of this house was say 15c per cubic foot.

Now he has placed in his hands a set of plans where the house is 36 feet front by 30 feet deep, with peak roof. The specifications called for northern lumber to be used in its construction. The foundation to be entirely of stone and the cellar floor to be concrete. Only one porch is to be built in the front entirely of wood. The interior finish to consist of birch, oak and yellow pine. There are to be cabinets, bookcases, etc., but entirely different in size and style from those on the other job. Naturally there were many smaller differences.

We surely know that the same square foot basis would not hold good on the two houses, but is it possible to even use it as a basis, and take up differences by adding or deducting? Would it not be better to figure anew? Seems like a too uncertain way of doing so an important a thing.

Its true, of course, that estimating at its best is in a sense a guess. But let a man take up the various sections at a time, one by one considering each part singly; then put them all together as a whole, and he will come much nearer to the right cost, than if he took it up as a whole in the first place.

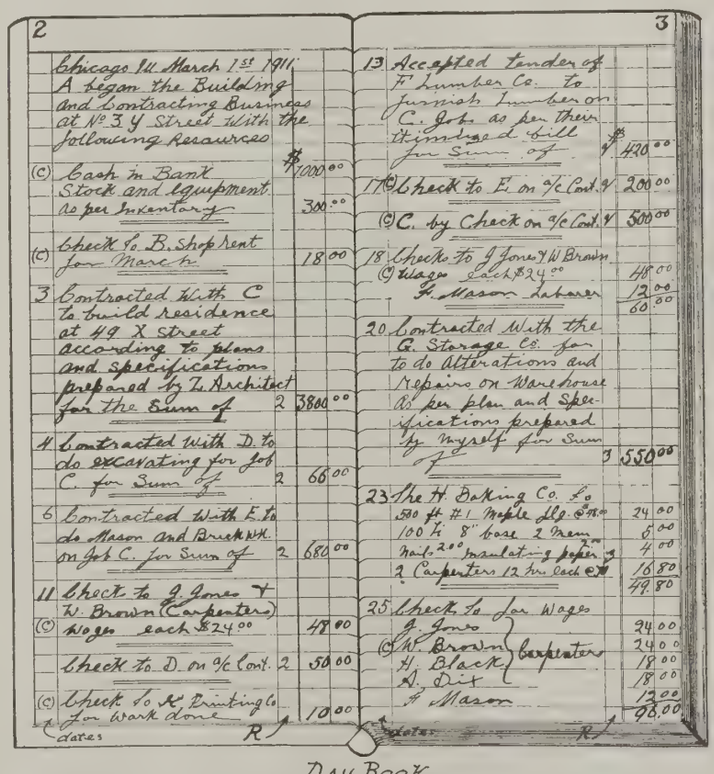
ADVICE TO ASPIRING CONTRACTORS

By CHAS. ANDERSON

IN taking up the subject of bookkeeping, it is not the writer's intention to attempt to give a system such as might be used by an experienced bookkeeper, but rather a simple system such as one would keep for himself, which has been found quite suitable and to answer the purpose for a contractor doing quite an extensive business.

The chief object in keeping a set of books is to be able to tell at short notice what your financial standing is; a system that will answer this question is all that is required. The system shown here, if correctly kept, will answer the purpose fully.

The main thing is to be able to tell what you owe and who owes you and the amounts. By balancing up this and taking an inventory of your stock and property, you can soon tell whether you are running at a profit or a loss.



For those who desire, it would be a good plan to take a course of bookkeeping with some reputable correspondence school, of which there are a number in the field.

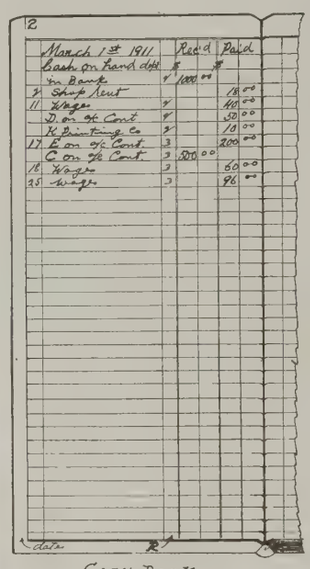
BOOKS REQUIRED.

Different systems require different books. The simple system the writer proposes to show here requires a day book, cash book, estimate book, stock book and cost book. At present only the first three will be dealt with.

In order to simplify as much as possible, I have shown sample pages of these three books showing the entries from one posted into the others. In the day book the transactions of each day should be entered as they occur, making each explicit. Where there is no written contract, specify in the day book what the agreement was.

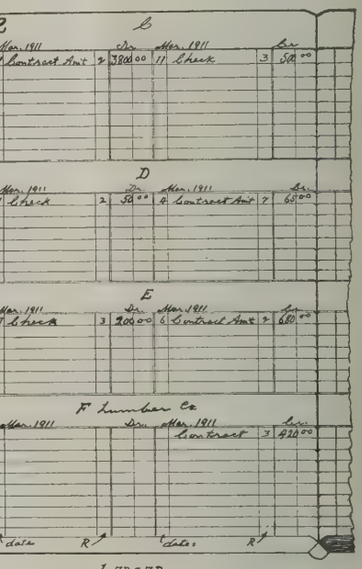
Letters have here been used instead of names. It is also assumed that the contractor pays all his bills by bank check, as every business man should, for this very materially simplifies the system.

DAY BOOK



When every transaction is entered into the day book daily, if it is not found convenient to post it into the other books each day it can be done, say, once each week.

Only the cash transactions are entered into the cash book; that is, cash received and paid out. The letter (c) in the date column indicates that the entries have been carried to the cash book; the figures in the column R in the day book indicate on what page in the day book the entry will be found should it become necessary to refer to it.



In the ledger is kept each individual account, so that any account can be turned to quickly and will show what the standing is.

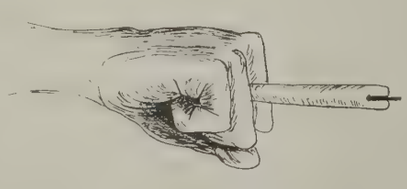
The first account in the ledger is seen to be that of C. The amount of the contract price is placed on the Dr. side of the ledger, as this is the amount C. will owe when the contract is complete; all payments C. makes to A. are placed on the Cr. side.

Accounts D., E. and F. Lumber Co. are contracts A. has made for money to be paid out by him, so they are placed on the Cr. side of the ledger, as all of these have these amounts to their credit when they have fulfilled their contracts, any payments that A. makes on these he enters on the Dr. side of the account. The figures in column R indicates on what page these entries will be found in the day book, and column R in the day book on what page in the ledger; this makes it easy to refer from one book to the other when necessary.

CASH BOOK

LEDGER

The entries in the day book of the G. Storage Co. and the K. Baking Co. show on page 3 in the ledger, as indicated by figures in column R in the day book.



If the reader will trace these entries from one book to the other he will soon get the idea.

In my next paper I will deal with the Cost Keeping and Estimate books.

A WORKING KINK

By W. A. LANE

ONE sometimes has to drive a nail that is just out of reach by holding it with one hand and driving with the other, as in the ceiling or around a corner. By using the following method it is easily done: Bore a hole in the end of the balance handle about ¾-inch or an inch deep—a shade larger than the head of the nail you are going to use.

Drop your nail in the hole head first, hold the hammer by the head, and with a sure motion stab the nail where you want it. Then change ends with the hammer and drive the nail. In my hammer handle I have two holes, one I have filled with beeswax to dip nails into when they must go in hard wood or any place they might land; the other is ready to use as before described.

A QUESTION AND AN ANSWER IN BRICKWORK

SKEWBACK.

I WOULD like to ask you to explain a problem which confronted me recently.

I am a bricklayer. The foreman came to where I was building two brick jambs for a door opening. He said, "I want an arch turned over the opening. Give it a 6 inch rise," the opening was 4 feet wide.

Now, as a bricklayer nowadays is not given time to make a drawing to find the radius of an arch, it occurred to me that it would be convenient to have a formula at hand or in mind to find the fall of skewback without having to make a drawing, so I would be thankful if you could favor me with explanation of such formula in a near future edition of NATIONAL BUILDER?

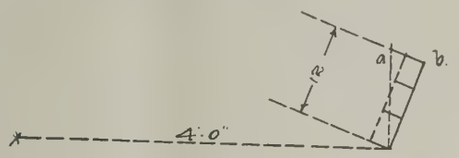


FIG. NO I.

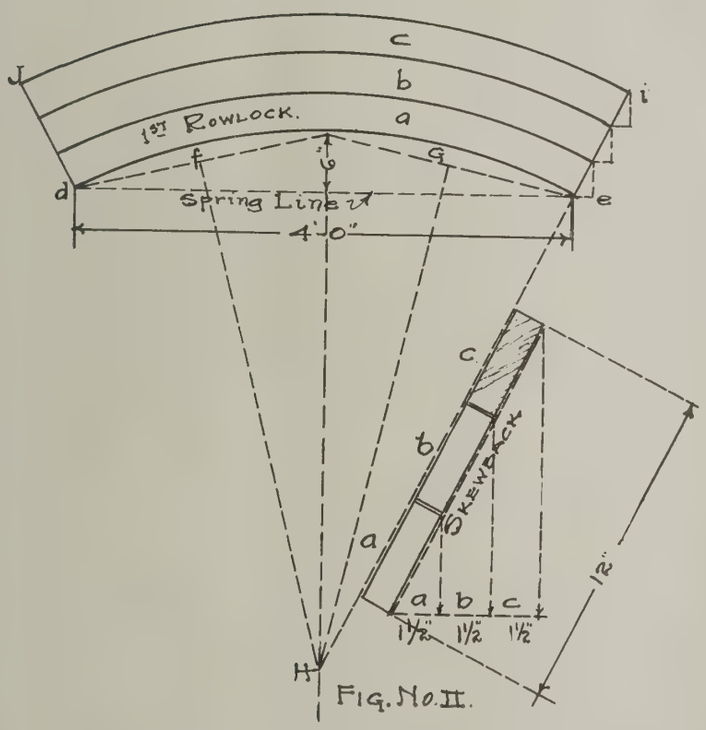

FIG. NO. II.

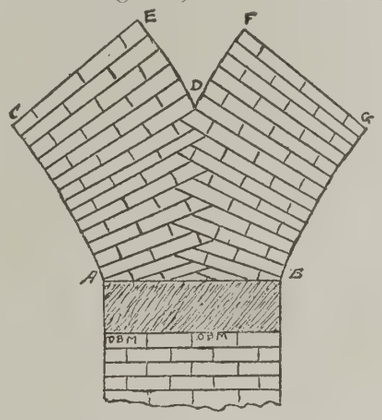
Replying to the query of our correspondent we would state that there are no arithmetical nor algebraical formulae published nor in existence for determining flake or slope angles of skewbacks, this being a geometrical problem and a matter of drawing, but there is a proportional method which can be followed if the work is hurried, with fairly mathematical and mechanical accuracy as follows:

Referring to the correspondent's sketch (Fig. 1) we find the span between the faces or revels of the jambs four feet, the soffit of the arch or rise six inches. Now if we lay out the arch as indicated in Fig. 2 by joining the point of the rise with d and e by dotted lines, bisecting these and squaring down, we locate the center H, which joined with H-e and H-d produced will give the slopes of the skewbacks e-i and d-J all being done to scale. By enlarging the scale or setting the bricks full actual size we will find that each first brick, on right and left sides, flares or slopes one and one-half inches as J at the bottom of the diagram, similarly with the second and third rings or rolocks b and C or the total flare in the twelve-inch arch is four and one-half inches, a proportion of one-quarter of an inch to each inch of rise, a safe proportion to work from without doing any drawing for radius or going to the trouble of laying out.

For arches the spring lines of which are out of level or "Rampant" arches, as they are technically termed, the slope of the skewbacks will differ and their elevation must be drawn to definitely determine their angles.

We will now take up some difficult forms of "Skewbacks."

Refering to Fig. 3 for the benefit of all readers, will be seen the bonding of two segmental brick arches, each three stretcher brick deep in the rings springing from a finished capstone set on a four brick or 28 inch pier. The bricks forming the intersecting voussoirs below the top, or extrados lines are beveled and overlapped, to bond and tie together, so that there is no straight joints



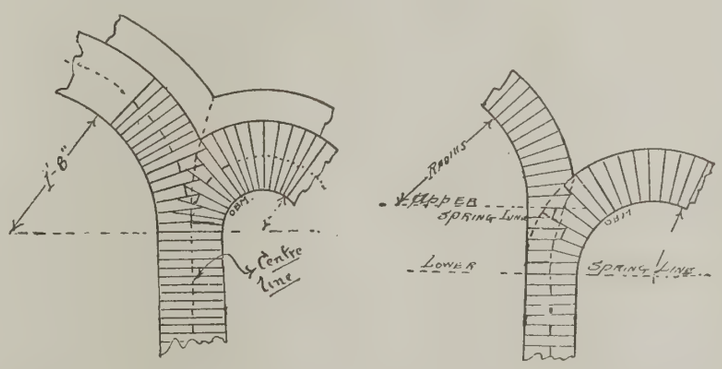


FIG. III.

nor mitres and the headers are carried up from the spring line. These skewbacks demand unusual accuracy in cutting, fitting, and laying, and are best laid out full size on a sheet of paper, drawing board, or clean floor, by commencing at the spring line A-B and after locating the center line, to sweep the soffit and extrados curves and then join the joint lines as A-C, D-E, B-C and D-F where the radiating lines of the right twin arch cut into and intersect those of the left, by this means the joints and beveled ends may be obtained.

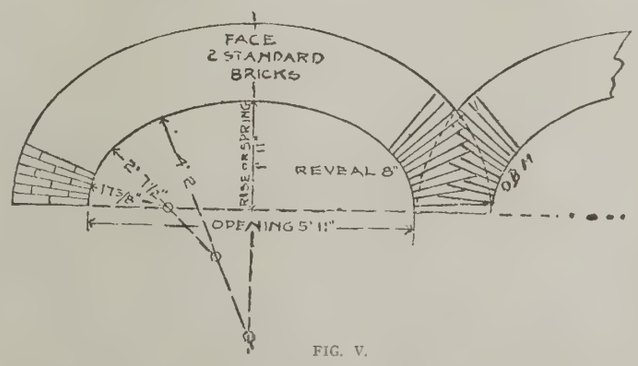

FIG. V.

Fig. 4 shows two more forms of intersecting arch skewbacks which differ from Fig. 3, in having the intersecting arches of various sizes, that in the center of the upper elevation being larger than the two flanking which will cause the intersecting joint, if not overlapped to assume a curve as O-P and if overlapped the joints will of course follow this direction, reversing on the left side, and it will be seen that the greater the arch which intersects its fellow, the more acute will be the arc of the curve of intersection. The

bottom elevation represents three equal vertical and overlapping intersections also correcting radial rod for verifying the joint lines, backs and intersections of sharp curves and those of diverging springing lines; also elliptic curves, which can, from the foregoing

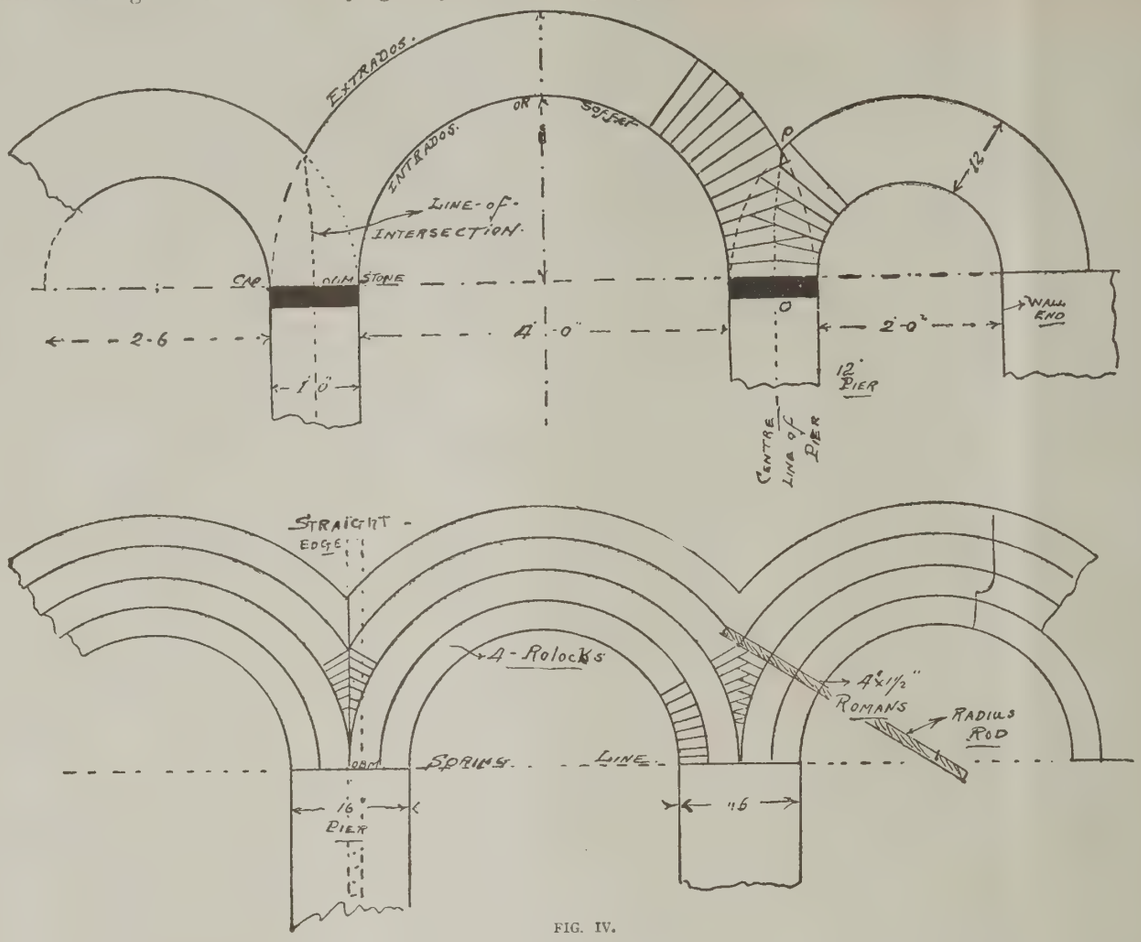

FIG. IV.

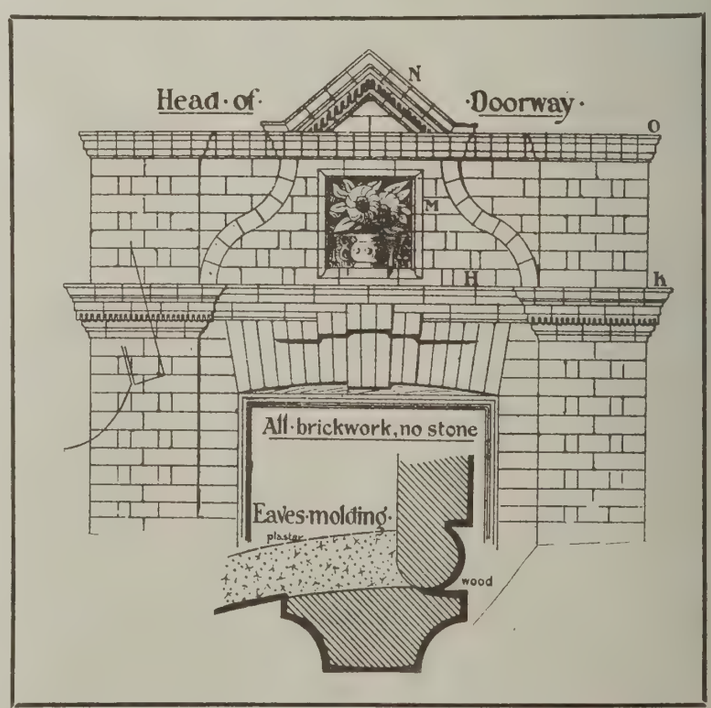
all of which will be found practical and useful by operative brick layers.

The three sketches shown in Fig. 5 represents various skew- descriptions and a close study of the diagrams, be laid out either to an enlarged working scale, or full size, as may occur to bricklayers and masons in actual practice.



CONCRETING IN WINTER

WINTER brings its troubles to all kinds of out-door building operations and it is a wise builder that can get the bulk of his outside work done when the weather is moderate and have inside work for cold weather. This is not always possible, though, and sometimes lots of work must be carried on right through the winter, even concreting and foundation building.

Frosty weather is not good for anything that contains moisture, because freezing causes moisture to expand when it hardens and thus tends to break down the structure of the material. It is not even good for lumber to just let it get wet and freeze, because it breaks down the bond between the fibers. To a certain extent this same thing holds in regard to concrete and where it is reinforced jobs or an entire structure of concrete it is pretty difficult to handle it in mid-winter and make a success. It can be done by taking precautions to enclose as much of the building as possible and cover the work with canvas and keep fires around the basement to drive out the frost, but it is expensive and not satisfactory. So, a man doing work of this kind in the winter should figure almost double price on it.

There are certain kinds of work; take ordinary monolithic work for a frame house foundation and it can be done right along through the winter by simply taking the precaution to cover fresh work over with canvas or something to keep the frost off at night.

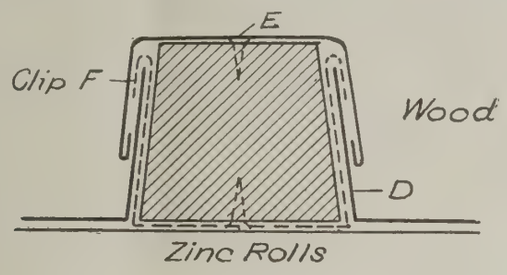
Work like this, that is done in the ground, is protected some by the ground itself, and besides it does not require the strength that is necessary in reinforced construction. Consequently, when the weather is not so cold that the water and sand will freeze in mixing one can put up concrete foundations in winter time and do the work in the wall part of the day and quit a little early at night and cover the work over with canvas or boards and it will do very well. The same thing is true of making cement walks. The surface must be covered over and protected until the primary setting after which it will fare very well.

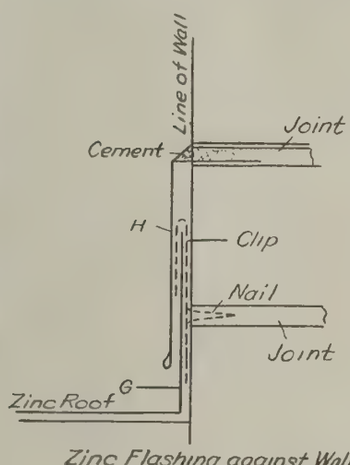
THE VALUE OF ZINC ROOFS—Concluded from February

By H. M. SANDERS

In regard to making the side seams on the long way of the sheet, when the two sheets are joined together on the incline at pitch of the roof, the best method from an English point of view, is or seems to be that, as shown in Fig. 3, especially on comparatively flat roofs, because of the fact that the upturn of the sides of the sheets are not nailed to the wood roll against which it rests, but is held in position by means of a cleat which gives the free action at this point of the sheet.

The wood roll as shown in Fig. 3, in size, is about 1¾ inches wide at its base, where it joins the roof, 1¾ inches deep, and 1¼ inches across the top. This wood roll of course is nailed to the roof, lengthwise, with its pitch, and placed on centers apart a suitable width to meet the requirements of the width of the sheet zinc used for the roof, with an upturn on each side of same as shown. But before being fastened down to the roof, a cleat 2 inches wide and of sufficient length to form the cleat, as shown by dotted line F. These cleats are placed about 18 or 20 inches apart. As they have to be accurately placed with the center of the cleats on the bottom of the wood roll, it is better to have them placed in position and nailed with a single nail to the bottom of the wood roll before it is nailed to the roof. After the wood roll is nailed to the roof then turn the cleats up against the sides of the roll, and when the sheets of zinc are placed in position with edges turned up as shown at D, the cleat is then turned down over the top edge and holds the sheet in place, as also shown, in Fig. 3. The top of the roll is covered with a loose-fitting zinc cap and fastened to same by means of 1¼-inch wood screws every foot apart, and a zinc cap soldered over them, leaving the outer edges of the cap, which turn down over the upturn of the roof sheets, free action in its expanding and contracting qualities.





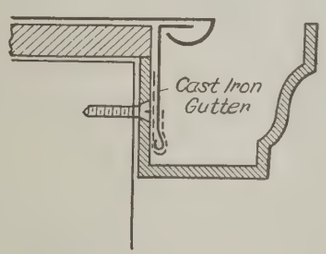


FIG. 3.

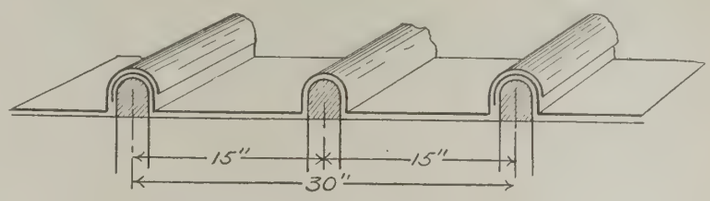
In Fig. 4 is shown one method of flashing zinc against the outside walls. As the upturn of the zinc roof is to turn up against the wall about 6 inches, clips, as shown by dotted lines, are nailed to the seam in the wall below the top edge of the upturn G as shown. When the sheets of zinc are placed in position and turned up against these clips, the end of the clip or cleet, is then turned down over the top of the 6-inch turnup of the zinc roof, and holds it down securely in position, without confining it so rigidly as to prevent the expansion and contraction of the metal. After which the cap flashing as shown by H in Fig. 4, is placed in position, and



Zinc Flashing against Wall
FIG. 4

Zinc Roof flash into Gutter
FIG. 5

extend down over the top edge of the upturn of the zinc roof about 4 inches, with its lower edge turned up on the inside to stiffen it and make it adhere more closely to the lower roof flange. The top edge of this cap, flashing or apron is to extend into the seam in the wall and then cemented in.

Italian Corrigated Zinc Roofing
FIG. 6

When these zinc roofs are connected at the lower or eave end of the roof, especially when they connect with gutters, they are usually constructed as shown in a simliar manner to that shown in Fig. 5. With the exception that if the gutters are made of sheet metal instead of cast iron as shown, the back of the gutters could extend up to the roof line with an edge to turn out ¾ of an inch, on which to slip over the roll formed on the lower edge of the sheet zinc which forms the roof covering.

But, in such cases of a cast iron gutter, as shown when the back of the gutter does not extend up to the roof line, it requires a strip of the roof metal, fasten to the back of the gutter as shown with its lower edge doubled over on the back to stiffen it, and the top turned out to hook on, so to speak, the lower edge of the zinc roof.

There is another style of zinc roof, that is thought by some to be a still better class of zinc roofs in many cases than those we have described. It is what is called The Italian Corrugated Roof, as we have shown in Fig. 6.

On this plan or method, the corrugates are not close together but are about 15 inches on centers to meet the requirements of the width of sheets 3 feet wide. Usually no roof boards are used for this roof, for the reason that each corrugate fits over the top of the rafter, the top side of which is made round to receive it.

These rafters rest on purlines which are placed from 6 to 8 feet apart, which of course run at right angles with the pitch of the roof.

The size of the corrugates are 3 inches deep and the width of the rafter. The fact that there is no support to the metal roof between these corrugates, would seem an objection in many cases to its use. But still, it is a kind of roof that seems quite common in European countries, as it is being used for covering railway stations, shed and warehouses, etc. For this reason it gives the American people an object lesson to study, as the possibilities for the future, of a more general use of zinc roofs on our buildings than in the past.

RECORD FOR CONCRETE CONSTRUCTION

SOMETHING like a record for speed of construction has been established in the erection of the Manufacturers Home Building, in Vancouver. The structure, which is of concrete, was put up from the water's edge to a height of 103 feet in 118 days. There are about 14,500 square feet of floor area per floor, and the floors are designed to carry a live load of 175 pounds per square foot, the concrete slabs being carried on shallow concrete beams and girders, which, in turn, are carried by hexagonal columns, heavily reinforced to cut down their sizes to a minimum. The entire floors were finished as the work progressed from floor to floor, and were immediately covered with lake sand, to protect them from being marred. The building piers rest on clusters of piles. The largest columns in the basement are 28-inch hexagons and the smallest, in the upper story, are 10 inches square.

Newark, N. J.

I am well pleased with THE NATIONAL BUILDER; enclosed I send you the money for another year's subscription.

D. E. Gould.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

(Continued from February.)

IF we step back slightly and view a house so that we see just the front of it and nothing else, we can get the shape and size of the front, but we cannot tell its depth and the shape of its three other sides. If we step around the house and view these other sides we can get the shape and size of each alone but we learn nothing of the ones we cannot see. If we could be above the house we would see the roof and nothing else. From this view we could tell the size and shape of the house but we could not tell its height.

Now let us suppose that straight lines parallel to the sides of the box be drawn from each point on the block to the co-ordinate planes of projection. These lines just drawn are called projection lines or projectors. Now the points on the planes where these lines intersect with them are connected, giving us the figures of each side of the block on each of these planes. These different views are designated plan or top view, front elevation and side elevation. The left side elevation would be the same as the right, and the rear the same as the front, therefore they are left out of Figure 21 for the sake of clearness.

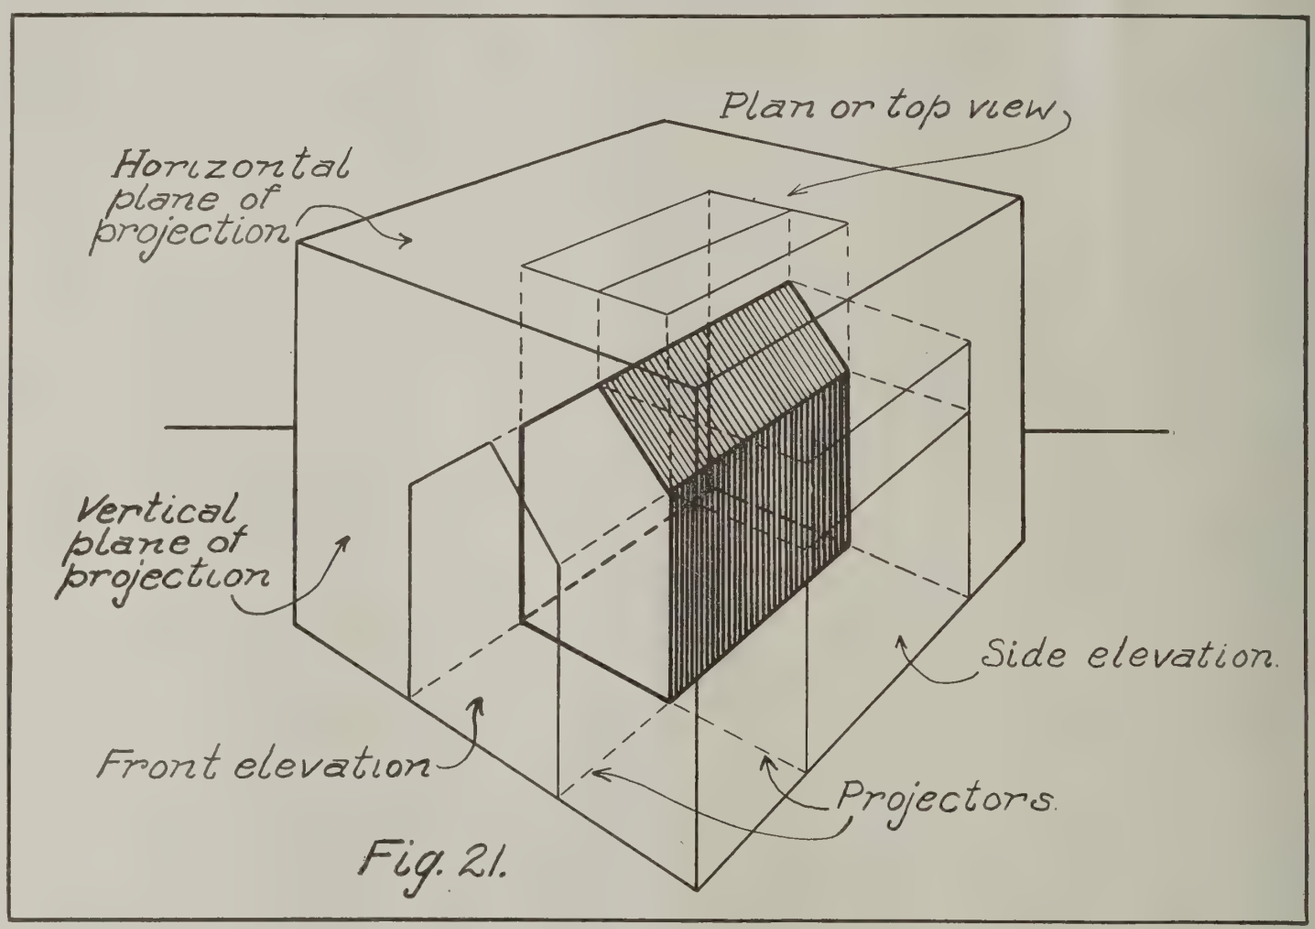


Fig. 21.

The view as we see it from the front is termed the front elevation, the view of the sides the side elevations, and the back the rear elevation or back view. Looking at it from above we get the top view or plan of the roof. If we could take a saw and cut the house around through the first and second floors we would call the section through the first floor the first floor plan, and that through the second floor the second floor plan, etc. These different elevations and the roof plan as projected on a flat surface from the house itself, constitute what is known as orthographic projection. We will now take it up theoretically and work out some of its simple problems.

In Figure 21 let us suppose that we have a rectangular box with transparent sides. Inside of this box and parallel with its edges, we will place a block with a sloping top to represent a house with its roof. The top side of the box is known as the horizontal plane of projection, the front side the vertical plane of projection, and either side on the right or left of the front, the side-verticle plane of projection. These three together are called the co-ordinate planes of projection.

PLATE VII.

ORTHOGRAPHIC PROJECTION.

After laying out the margin lines on your paper, study the figures and text carefully before putting in any of the figures on your plate, as some of them are problems and require more space than is here shown.

If the sides of the box of Figure 21 were hinged and spread out all on one plane we would have a figure similar to Figure A. Here I represents the plans or top view, 2 the front elevation, 3 the right side elevation, 4 the left side elevation and 5 the rear elevation. As stated before the front and rear elevations are alike, also the two side elevations.

Figures B and C show why at least three views are necessary to properly show the shape of an object. If the plan was left from each of these figures there would be no way of telling that one was a square prism and the other a rectangular prism, as the front and side elevations of both are alike.

Figure D gives us the projections of a hexagonal prism. To draw it, first construct a hexagon which represents the plan, then project lines down to form the front elevation, and where the top of the front elevation intersects the right hand projector set the compass point and draw the arcs as shown. From these points complete the figure by drawing in the side elevation. In this figure and some of the succeeding ones, notice the use of the center lines.

Figure E presents a more difficult problem as four views are needed to fulfill the conditions. Here we have a rectangular prism set with its small end at an angle of 30 degrees to the right. To more easily understand the problem it would be well for the student to take a box of that shape and tilt it a little to the right. Then view it down and from each side, and it will clearly illustrate the views here shown.

at an angle of 90 degrees to its base.

Figure G presents a rather complicated problem, but by carefully following the principles learned and clearly seeing each step as the work progresses, little difficulty should be experienced in solving it. It represents a square pyramid whose top has been cut off at an angle of 30 degrees to the horizontal and whose base is 60 degrees to the right. The front elevation is here given, a plan and two side elevations will be needed to complete the drawing.

After completing this plate, do not let your study of orthographic projection end, as it is a very important topic and there have been a number of volumes written on it alone. You can easily work up problems of your own along the line here given, or you can take some small article of furniture and draw it up in three views. And above all keep in mind the principles learned as they are the

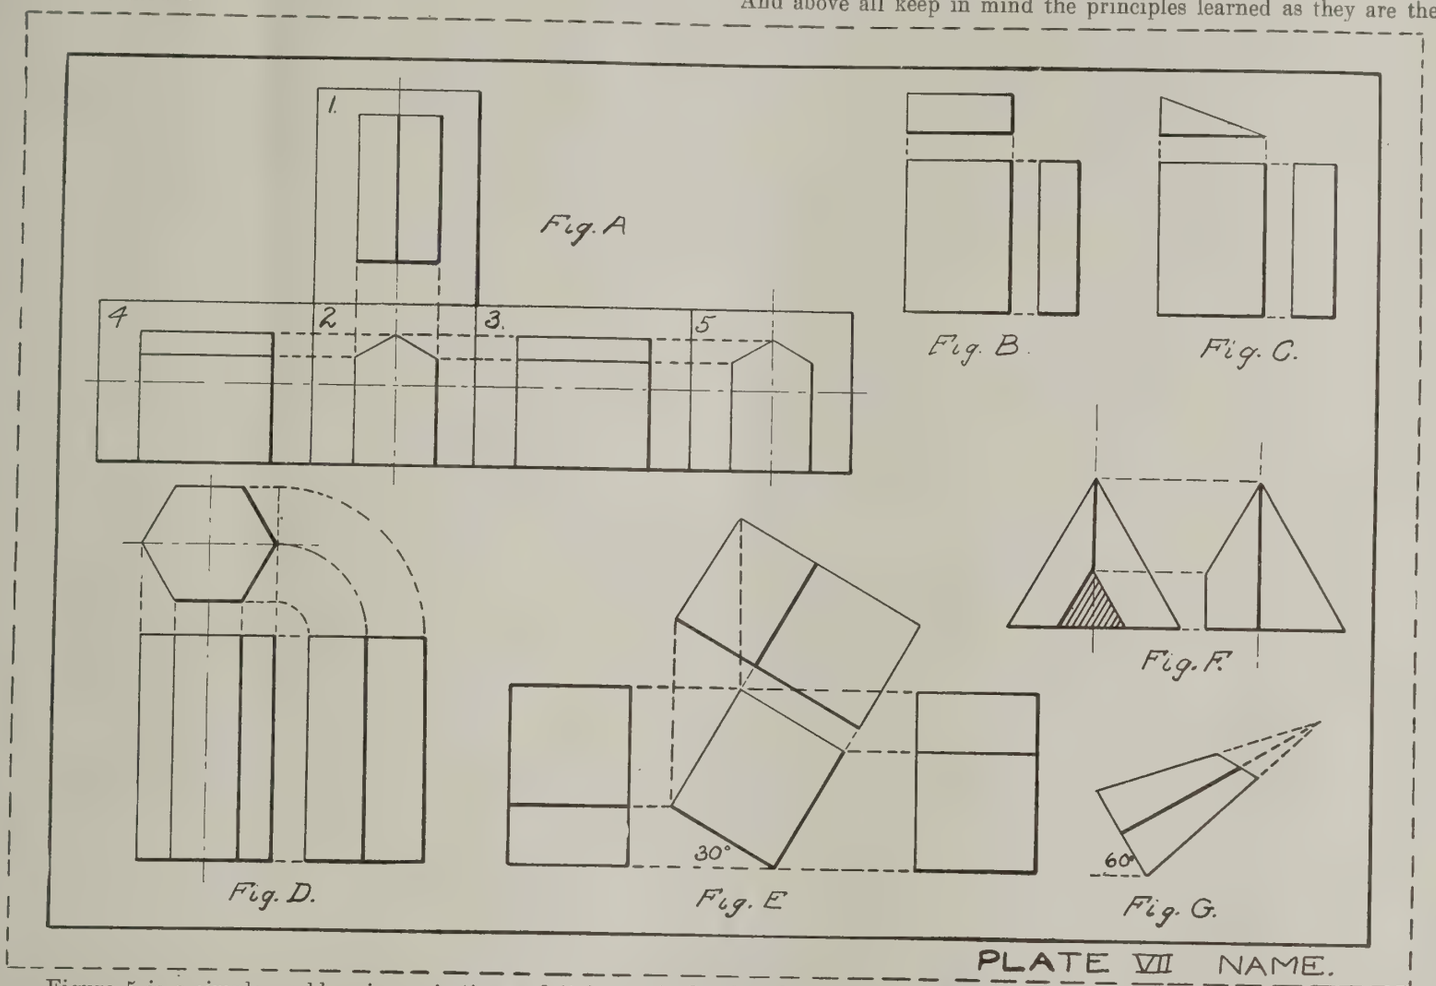

Figure 5 is a simple problem in projection and it is required of the student to complete the figure by putting in the plan. It represents a square pyramid, one of whose corners has been cut off

foundations on which the working drawings will be built further on in this course.

(To be continued.)

Latest Legal Decisions

There can be no mechanic's lien on vacant land, where the uncompleted building, without fault of the owner, has ceased to exist.—Watson v. Alta Inv. Co., 108 P. (Cal.) 48.

A building contract provided that no alteration, addition, deviation, or omission which affected the price or the time for the completion of the work should be done without a written order of the architect, approved in writing by the owner. Held, that there was no power in the architect to waive the provision for a written order.—Van Buskirk v. Board of Education of Passaic Tp., Morris County, 75 A. (N. J.) 909.

Where a building contract provided that the expense incurred by the owner and damages resulting from the contractor's default should be audited and certified by the architect, whose certificate thereof shall be conclusive abandonment, the architect's certificate was admissible in evidence.—Shriner v. Craft, 51 So. (Ala.) 884.

Where a building contract provides that the architect's certificate shall be conclusive as to the expenses incurred by the owner and the damages resulting from a contractor's default, it is conclusive thereon, in the absence of fraud or gross mistakes indicating bad faith or failure to exercise an honest judgment in making out the certificate.—Shriner v. Craft, 51 So. (Ala.) 884.

Where a building contract expressly provides how the loss shall be borne in case the building is destroyed by fire or earthquake, a covenant that the building must continue in existence, and that a destruction thereof before completion shall excuse further performance by the contractor and entitle him to recover for the value of the work done, will not be implied.—Watson v. Alta Inv. Co., 108 P. (Cal.) 48.

A contract between a contractor for alterations on a public school building and a subcontractor provided for "tin roofing cornices, slate work, leader and all metal works for Lincoln avenue school as per plans and specifications by E. F. Gilbert, architect, and to his satisfaction, for the sum of twenty-seven hundred dollars ($2,700). Held, that under this agreement the subcontractor was not entitled to his pay until he had finished his subcontract, nor until the architect was satisfied that the work was properly done.—Meurer v. Kilgus, 75 A. (N. J.) 899.

Where a subcontractor seeks to avail himself of the benefit of the mechanic's lien law, he must bring himself fairly within its provisions, by complying with its terms, and is not entitled to a lien unless he notifies the owner of the land by registered letter previous to the completion of the contract that he has furnished materials, machinery, or fixtures. Mere personal knowledge of the owner that a particular person is furnishing material to the contractor does not supply a statutory notice upon which the person furnishing the materials can predicate a mechanic's lien on the property of the owner.—North Dakota Lumber Co. v. Bulger, 125 N. W. (N. D.) 883.

Where a building contract provided that, if before completion the work should be wholly destroyed by fire or earthquake, the owner should sustain the loss to the extent of the installments paid or due, and the contractor should lose the installments not then due, the contractor, on destruction of the building before completion, could not recover on the theory of substantial performance, though the value of the work remaining to be done was only $48 and the contract price was $13,000; the owner not having received the benefit of the work and not being able to recoup damages for imperfections or omissions therein.—Watson v. Alta Inv. Co., 108 P. (Cal.) 48.

ANSWERS

ROOF TRUSS.

From E. M. K., Nevada, Ohio: I want a design for a roof truss over a span of 48 feet, roof to be light.

The following answer to the foregoing query is submitted for our correspondent's consideration:

In the construction of this truss, the commercial sizes of timbers are used, allowing the use of material from stock instead of having to order long lengths of special sizes from the mill. It also allows the best pieces to be selected for the places where the greatest stress comes. There is also the advantage that the truss can be assembled on the ground complete, taken apart, and the small pieces taken separately up to their places and re-assembled from a suitable scaffold. Of course, if the facilities will permit, the truss can be assembled on the floor of the building and lifted in one piece to its place on the wall. (See diagram above.)

DESIGN FOR A WOOD TRUSS 48'-0" SPAN
TRUSSES TO BE PLACED 10'-0" ON CENTERS

It will be noted that all the connections are made with bolts. This makes a much stronger and safer job than by spiking the pieces together, and, of course, is a great advantage in case it is necessary to make alterations or take the truss down at any time. Only square head bolts should be used, so that they can be made tight. Large washers should be used under all bolt heads and nuts which come against the wood.

It is to be especially noted that this truss is designed for a span of forty-eight feet, with the trusses spaced ten feet on centers. Should the location require a greater span or spacing a corresponding increase in the members will be necessary.

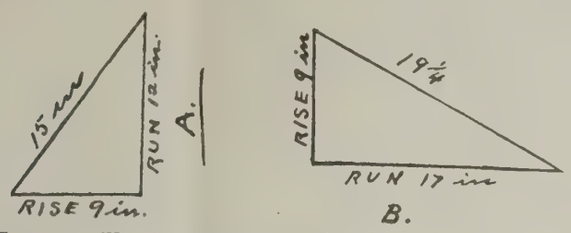
In assembling the truss, note that no cutting off of the timber is necessary, the pieces being spaced to allow the joining pieces to run through. The four pieces of "A" over-lap the ends of "B," making a very strong joint where the greatest stress comes. In like manner the pieces "D," "F," "H" and "J" are joined to "A" and "B."

If it is desired, the members "D," "F," "H" and "J" could be made in the form of rods, but the fastening of the ends require special fittings.

After the truss has been in place long enough for the lumber to be perfectly seasoned, the bolts should all be gone over and left perfectly tight.

CUTTING HIP VALLEY AND JACK RAFTERS.

From B. J. Pittsfield, Ill.



In answer to J. A. B. of Lake Megantic. I might say to his question Yes! and I will try and explain, but before doing so, I wish to say a few words in regard to the way a great many questions are answered.

There are a good many working at the trade who are not very far advanced in mathematics, and as to algebra, geometry and such things, they know nothing about them. When these fellows, who make an attempt at answering these questions, and make drawings and mix them up with algebra and geometry, and expect to be understood they are mistaken, and the more the student looks at it the less he knows about it. I have seen questions answered which were enough to make a young man just starting, throw up the business. Then again, there are men working at the trade, who would not understand a thing, it matters not who explained it, or how simple it was. I think the trouble with some is that there is something out of place with their think tank. You must think with your head, and think hard. When you have mastered a thing, salt it down and try to learn something new. We never get too wise to learn something new, even if we serve our whole life working at a trade. When I see these questions asked, I take it for granted that the one asking them is looking for information.

Now to explain the question for J. A. B. we will first take a roof with 8 inches rise for one foot run. Now for every foot the rafter spans, the rafter is 14 7/16 inches long. Why? Because a rafter is the diagonal of the run and rise and the diagonal of

8 inches and 12 inches is 14 7/16 inches. Now for a roof with 9 inches rise to 1 foot run, the rafter is 15 inches long for each foot that it spans because the diagonal of 12 inches and 9 inches is 15 inches and so on with any pitch roof.

For example notice the drawing A. We see the run is 12 inches and the rise is 9 inches and the diagonal is 15 inches.

Now we will suppose we are going to roof a building 24 feet wide and the roof is 9 inches rise to the foot run. If the building is 24 feet wide, one rafter will span half of the width, or 12 feet, and as we said the rafter was 15 inches long for 1 foot run with 9 inches rise, a rafter 12 feet long would be 12 times 15 inches or 180 inches and 180 inches equals 15 feet, the length of common rafter. This is the length of rafter from out side of wall plate to peak of roof, and does not allow any projections.

The figures that cut the common rafters will cut the jacks, and to get the length of jacks we will say they are to be 2 feet apart or 2 feet on centre. Therefore the first or shortest jack would span 2 feet and as we said the rafters were 15 inches for 1 foot run, of course the first jack would be 30 inches or 2½ feet long. The second one would be 60 inches or 5 feet long, and so on. To get the bevel on jack to fit against hip, we take the run or 12 inches on the tongue, and length, which is 15 inches on blade and cut on blade, and you will have the correct bevel. Of course, you will have to cut your jacks short, one-half the thickness of the hip, or they would be that much too long every time, and would not space out right.

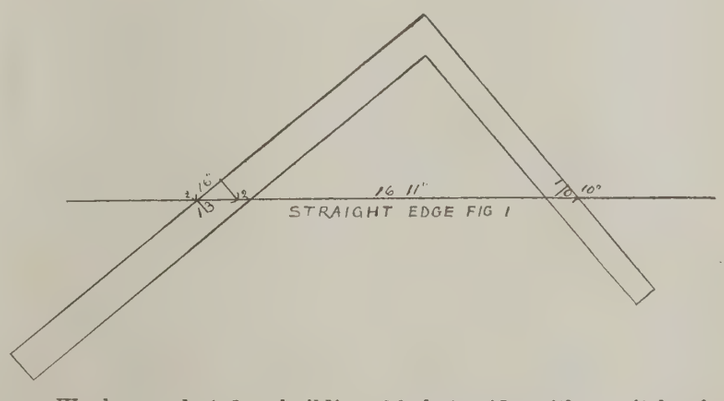
Now for the hip and valley rafters. The diagonal of 12 and 12 is 17 and a hip rafter is the diagonal of a square added to the rise of roof. (See Fig. B). Now to cut the hip rafter, we take 17 inches on the blade and 9 inches on the tongue, 17 cuts the foot of rafter and 9 cuts the top or plumb cut. Now the length of the hip for 1 foot span is 19¼ inches because the diagonal of 9 inches and 17 inches is 19¼ inches. While the hip rafter does not run straight across the building, but diagonally, they are supposed to meet over the center of building, therefore it will be 12 times 19¼ inches to get the length of hip, and 12 times 19¼ inches equals 231 inches or 19 feet 3 inches or the whole length of hip, not allowing anything for projections, and the hip must be cut short one-half the thickness of the ridge piece. To get the bevel on hip to fit the ridge piece, we take the length of hip for 1 foot run which is 19¼ inches on the blade, and its run which is 17 inches on the tongue, cut on the blade and you will have the correct bevel. The valley rafters are the same as the hip and the same figures cut them. The only difference in laying off the common rafter and the hip is that you use 9 and 12 for the common, and 9 and 17 for the hip, and step off the same number of times for each. I hope J. A. B. will have no trouble in understanding this.

CUTTING HIP, VALLEY AND JACK RAFTERS.

From F. L. T., Corpus Christi, Texas.

J. A. B., Lake Megantic, will find suggestions in the December and January numbers for finding the length of rafters without the use of a drawing. The drawing is advised for a complicated roof as mistakes are thus more easily avoided and the different pieces can be marked to correspond to the roof diagram and can thus be quickly found when wanted as the roof is raised. A moment's consideration will show that the rise, run and length of a rafter form a right triangle, the length being the hypothenuse. Now as suggested in the articles mentioned, if we suppose 1 inch to represent a foot, 1/12 inch will represent one inch, we can use the side of the square divided into inches and twelfths. Assume a pitch 9x12. Measure 9 inches on the tongue and 12 inches on the blade. Measure between these points 15 inches for the length of the common rafter for each foot of run. If the run of the rafter whose length is sought be 7 feet, the length will be 7x15 inches or 105 inches. If the run be 14 feet 7 inches the length will be 14 7/12x15 inches. The lengths can thus be quickly measured on the square, "stepped off" on the timber, or calculated with any desired degree of accuracy. Coming now to the hips and valleys, if J. A. B. will use a little imagination and patience he will discover two triangles at the hip or valley he can use. As before, he can use the rise and run or 9 and 17 and obtain nearly 19¼ inches. The distance between the foot of the hip and that of the common rafter at the end of the ridge is equal to the run of the common rafter. Thus we can use the figures 12 and 15 and obtain the same result. If these figures are taken on the square, the square applied to a jack rafter and a mark made along the 15 side, this will give the cut against the hip or valley. Similarly the figure 17 and the figure corresponding to the length of the hip, marking along the portion of the square containing the latter figure will give the cut of the hip or valley against the ridge. These principles are general and can be applied to finding cuts for cornice, braces and bevels of many sorts. Space forbids a detailed explanation at this time but if any reader finds difficulty in applying this method I should be glad to help him, through the columns of this paper.

Note from Editor:—With regard to the above answers we may say that we have got some 10 or 12 other answers to the question. Many of them very good. This is particularly true of one from H. F. G., Grabill, Ind. Another one from A. A. S., Chicago, Ill., and several others to whom we are obliged. We also append the following letter in connection with the answer that may be taken advantage of by such of our readers who may desire to get further information.

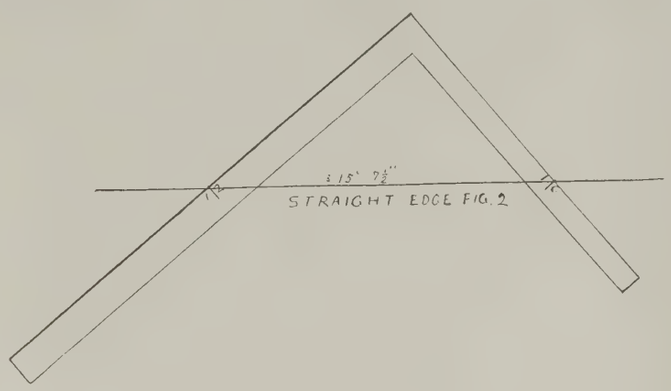


PORTLAND, Jan. 23, 1911.

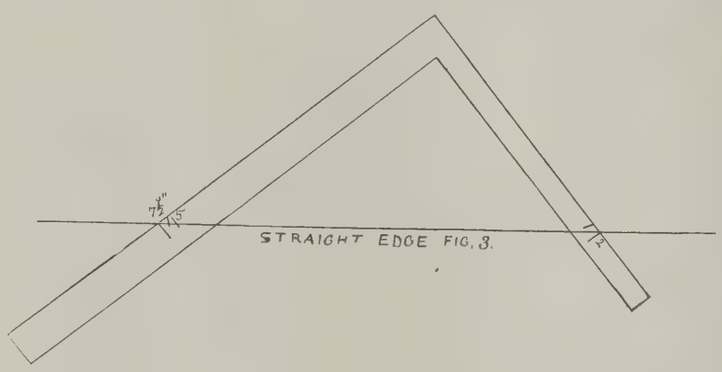
To THE NATIONAL BUILDER.

If J. A. B., Lake Megantic, will write to W. Brown, 929 E. Davis street, Portland, Ore., he will learn something to his advantage about finding lengths and bevels on hips and jack rafters without a drawing. Being a carpenter and having had years of experience at roof framing I think I can teach a far better rule than drafting of framing from a draft.

HIPS AND VALLEYS.

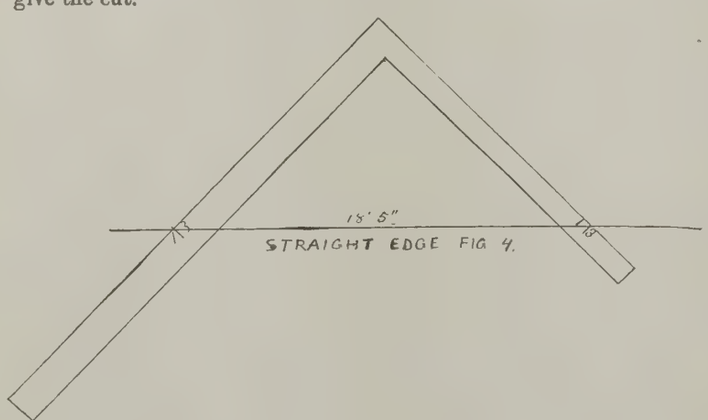


In answer to J. A. B., Lake Negantic, I take pleasure in submitting the following solution to his question. There is a way of finding the lengths, bevels and cuts of hips, valleys and jack rafters without making any drawings. The only tools necessary is a straight edge about 4 feet long and the ever ready steel square with the man behind it who knows how to use it. It is like everything else, it's the man behind the gun that does business. We are not going to make any drawings of roof plans, but will submit a series of straight edge with the square properly applied for obtaining the length, and cuts of the different rafters, just to show how it may be done.

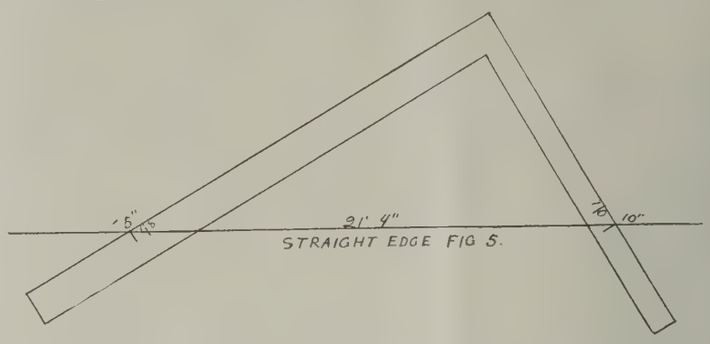


We have selected a building 26 feet wide with a pitch of roof 10 inches rise to the foot run of common rafter. Our selection has been made with a view of getting a roof that would complicate figures to some extent; that is, we don't want it too easy. We want J. A. B. to have to work his head a little to follow us, and then when it comes clear to his mind how it is done he will be right on this matter for all time to come.

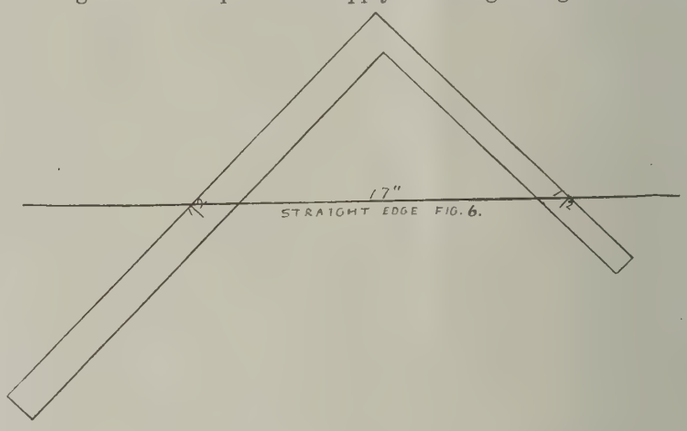
Referring now to Fig. 1, we will first place the square on the straight edge in position to find the length of the common rafter. The building being 26 feet wide the run of the common rafter is 13 feet, the rise being 10 inches to the foot the entire rise of roof is 130 inches, or 10 feet 10 inches. Now take the side of the square that is divided into twelfths, so that the twelfths will represent the inches when we are measuring distances. Lay the square on the straight edge with 13 inches on



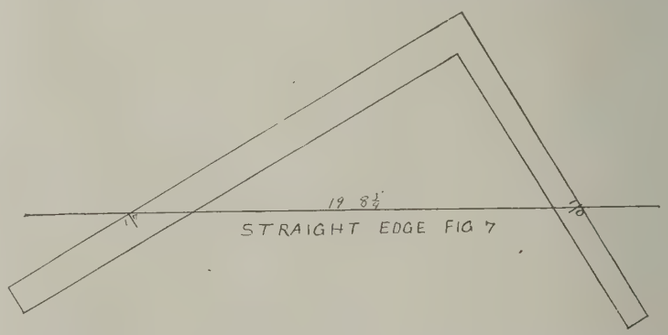
the blade and 10 and 10 twelfths inches on the tongue, and the distance on the straight edge between these two points represents the length of the common rafter, which in this case is 16 feet and 11 inches. Now for the jack rafter measure off on the blade from the 13-inch mark the distance the rafters are to be apart on centers; in this case we have measured 16 inches back, from the blade of the square, square down to straight edge and the distance from 2 to 2 as shown will represent just the amount shorter each succeeding jack will be toward the hip, which in this case is 1 foot and 10 inches.



We will now explain how to get the proper bevels. It is customary to take the figure 12 on the blade of the square as a basis to work from because the figure 12 represents a foot run of the common rafter. Our roof is 10 inches rise to the foot, therefore 10 inches on the tongue represents the rise, consequently the square placed on the straight edge corresponding to the figures 12 and 10, as shown in Fig. 2, gives the top and bottom cuts of



the common rafters. The 12-inch side is the bottom cut and the 10-inch side is the top cut. The bottom cut of a jack rafter is the same as that of the common rafter. The plumb cut at the top is also the same as that of the common rafter. The cut across the back of the jack is different, but is very easy to find. We already have the figures on the straight edge in Fig. 2 that give the cut.



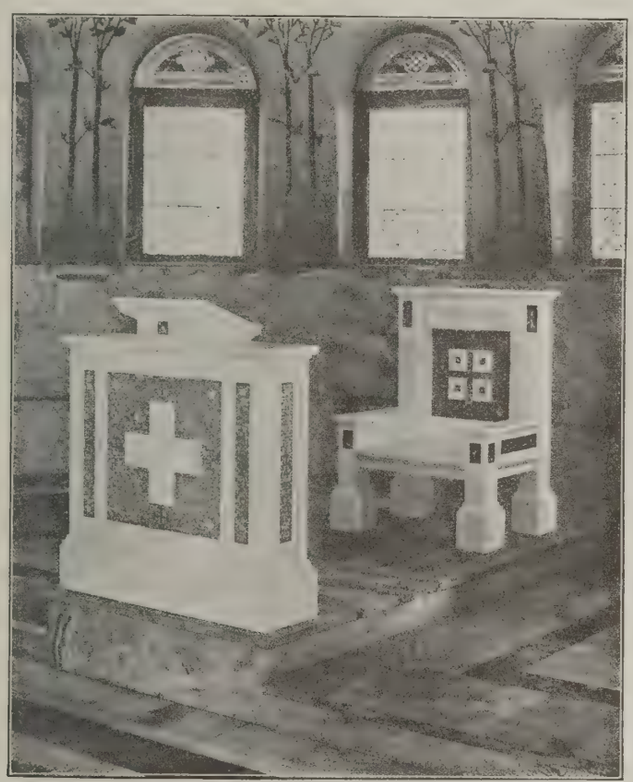
Take the figures 15 inches and 7½ twelfths on the straight edge, Fig. 2, which are in fact the length of rafter for a foot or 12-inch run, and apply them on the straight edge as shown by Fig. 3, and the blade of the square will give the cut across the back of the jack. We will now proceed to find the length and cuts of the hip. The building being 26 feet wide, place the square on the straight edge at 13 inches on the blade and 13 inches on the tongue, then the distance across on the straight edge, 18

feet and 5 inches, will represent the run of hip rafter. See Fig. 4. Now since the rise of the hip is the same as the rise of the common rafter for the corresponding run, take the run of hip, 18 feet and 5 inches, as shown by Fig. 4 on the blade of the square, and the rise of the roof 10 feet 10 inches on the tongue of the square and apply to straight edge as shown

by Fig. 5, and the distance across, 21 feet and 4 inches, will represent the length of the hip rafter, as shown by Fig. 5. The figures giving the top and bottom cuts of the hip are shown in Fig. 5 on the blade and tongue of the square, blade gives bottom cut and tongue top cut; but as we have stated before, it is customary to work from the figure 12 as a basis of calculation, so we take 12 and 12 on the square and straight edge, Fig. 6, and find the distance across to be 17 inches. Now take 17 inches on

the blade and rise of roof to foot, 10 inches, on tongue, and apply to straight edge, as show in Fig. 7. When the blade gives bottom cut of hip and tongue top cut, and the figures are 17 and 10. The figures across on the straight edge will give the cut across the back of a hip where hip joins on the side of a ridge or deck or any similar place. For this take the figures 17 and 19 inches and 8¾ twelfths. These figures are so large that it is not practical to apply them on the square in this manner, so just cut each side in half, which would make the figures 8½x-9 10-12 inches nearly, and for all practical purposes the figures can be called 8½x10; the 10-inch side gives the cut, and this will be a perfect fit.

We have been far more elaborate with this matter than we at first intended, and we advise J. A. B. to be careful and not get his measurements mixed. While the system we have outlined is absolutely correct if correctly followed, yet the framer must know what he is doing or he will fall down just the same.



To the experienced it is all easy; others must learn, even though they do sometimes make an error. For a complicated roof like the Russel House roof, we would recommend a roof drawing, as shown by Mr. Stevenson, for there is no man with a head big enough to frame all the rafters required in that roof without the aid of drawings. If he did not have something to guide him in the work he would sooner or later find himself entirely lost, and would find that the roof diagram would be the only means of finding where he was at.

It is not policy to try to do without drawings, where they are needed, and when they are needed they are worth far more than the time it takes to make them. To be an expert at roof framing, either with or without drawings, you must know how to apply the square, and if you thoroughly understand this it will be no trouble for you to make a roof drawing if you should happen to need one.

MISSION PULPIT.

From J. L., El Paso, Texas.

In answer to S. B. R. of Spur, Texas, I submit the following illustrations of a pulpit and chair, which are taken from the

DETAIL OF PULPIT.

Western Architect. The designs are by Harry W. Jones, architect, and I think will be suited to the wants of your correspondent.

If A. D. A., Chicago, who wishes to sell Bemrose's work on "Inlaying" will send his address to Thomas B. Brown, care J. W. Harrigan, 1208 N. Gay street, Baltimore, Md., he may find a customer for his book. We may say that this book may be obtained from Beard & Co., Publishers, Philadelphia.

DRAUGHTMAN.

From "Old Hand," South Bend, Ind.

If S. S., LaGrange, Ind., will read the articles now being published in the NATIONAL BUILDER, on Mechanical Drawing, he should pick up enough information to enable him to draw ordinary objects, with ease. Perhaps if the author of these articles would give a chapter or two on drawing instruments and how to use them, describing the various instruments, how to apply the ink to the pens and other similar information, it would help the beginner very much, as very few young fellows know how to use India ink, or even how to charge a drawing pen.

PAINTING TIN ROOFS.

From N. and G. T. Co., Philadelphia, Pa.

In answer to R. O. N., Scranton, Pa., we are glad to furnish the following information:

A new tin roof should be painted as soon as it is laid, with one coat of approved paint. Two weeks later it should have a second coat, both coats well brushed out. Two thin coats are far better than one heavy coat.

One year later, the roof should have another coat of paint.

After that, painting at three or four-year intervals should be amply sufficient to repair the natural wear and tear of the weather. The interval between paintings can be lengthened as the roof ages and the paint-skin thickens.

If good tin is used, and applied by a competent workman, following standard practice, and given the reasonable attention which, as a first-class article, it deserves, the roof should last as long as the building it covers. In fact we have on record many cases of tin roofs that have been found in such good condition after many years' wear, that in altering or tearing down the old building the tin has been carefully removed and set aside, or else sold for other roofing work.

The tin should be given at least one coat of paint on the under side before laying. The approved paints are red lead, red oxide, metallic brown or Venetian red, mixed with pure linseed oil. Very little if any dryer should be used.

The roof should be carefully cleaned of all rosin spots, dirt, etc., and should be bone-dry before the paint is applied. Keep workmen off the roof as much as possible at all times, before and after painting. Never use paints containing graphite or tar, on tin roofs, good as they may be for other purposes.

PAINTING TIN ROOFS.

From A. Ashmun Kelly, Malvern, Pa.

The question propounded by R. O. N., Scranton, Pa., "is it good policy to paint tin roofs, and if so, what kind of paint should be used," may strike some as being rather absurd, but not so, for a real tin roof would never need painting, and indeed would be the worse for any paint. This because tin will not rust, and therefore will need no protective coating, as what we call tin roofing does. What we have as tin, is simply thin sheet steel very thinly coated with the metal tin, with which there is usually mixed a goodly proportion of lead. Such tin needs paint and needs it bad. Not bad paint, but good paint, and there is nothing better for the first coat at least, than a good oxide of iron paint, mixed with boiled oil, or raw if you prefer. If the roof is done in warm weather and dry, you will not need any artificial drying, the oil will dry itself in due time, and make a better protective coating. Two coats at most, and one coat, properly mixed and laid on will do. Graphite paint of best quality is an excellent roof paint also. It wears well, and the only objection I find is that it is slippery, making walking on it, if steep, rather perilous.

CEMENT CRACKING.

From H. U. C., Detroit, Mich.

In reply to G. R. G., Bridgeport, Conn. The trouble with your cement work arises from too much water in the surface finish, or from too much work with trowel. When a rich mixture is troweled to any extent, the suction created by the tool draws particles of neat cement to the surface where they dry. This often causes fine cracks, known as checking, map cracking, and crazing

SHINGLE DIP.

From G. M., Chicago, Ill.

Replying to C. G. W., Rome, N. Y. There are a number of stains that can be made without using linseed oil, for "Shingle Dip," but none of them are as reliable as those having linseed oil as a base. A good dip may be made by using crude petroleum, if color is of no consequence. This may be thinned down to the right consistency with benzine. The color will be, when dry, a dark bluish green. Other coloring matter may be mixed with the petroleum and benzine which will give other shades. Another method is sometimes employed by using commercial kerosene, mixed with such coloring matter as may be desired. Sometimes dry Portland cement is mixed with the kerosene; this has tendency to make the shingle less liable to take fire, a danger that is always present when petroleum products are used. Sometimes the coarsest sort of fish oil colored by some mineral colors to suit, is used. Shingles dipped in this, however, take a long time to dry, and must be kept separate during the drying process. Cabot's shingle stains, made by Samuel Cabot, Inc., Boston, Mass., or "Timberasphalt," an Indian Refining Company (Cincinnati) preservative would probably be better than the home-made article.

QUESTIONS

BAY WINDOW.

From N. S., Minneapolis, Minn.

Permit me to ask through the columns of your paper what the average cost of a bay window would be, not including carpenter labor? Dimensions: Length, 9 ft., depth, 3 ft., and one story in height, with shingle roof. The glass in the windows to be of double strength.

SHINGLING GABLE.

From L. R., Westbury, L. I.

I would like to have you put before your readers some information in regard to the right way of shingling a diamond in

How can one avoid the double course at point A-B? If there are 2 or more methods? Has the length C-D got to equal A-B, in other words can the diamond be longer than broader?

the peak of a building. I want to avoid the double course at the point where the diamond begins to close in after reaching the widest point. I think others would like to know about this too.

CURVED SIDING.

From D. S. P., Scranton, Pa.

Will some kind reader please describe the simplest method of laying out the curve on siding that has to be bent around a semi-circular curve of two-foot radius, and oblige a new subscriber?

OFFICE BOOK FILE.

From Geo. H. B., Kiota, Colo.

I would like to see a design or diagram of a good office book file in an early issue of THE NATIONAL BUILDER.

CORRESPONDENCE

A CRITICISM.

Oil City, Pa., Feb. 2, 1911,

Editor, NATIONAL BUILDER:

Dear Sir: No. 1 of Vol. 52 of the NATIONAL BUILDER is at hand again full of useful information. Also I noted that Mr. Geo. Rice has been around again to the different architect's offices and has gotten some more of his ususal second-hand, mostly unreliable, information. Some time ago he had an article about concrete store fronts and concrete window frames. I believe in concrete, have had considerable experience in concrete work, but concrete store fronts and window frames are not practicable. They would obstruct far more light than wood or metal ones, and Mr. Rice ought to know it. His drawings are such that any ten-year-old boy would be ashamed of. Mr. Rice seems to have no practical knowledge of concrete or other building material, but seems to get all his information second hand. I have been a subscriber to THE NATIONAL BUILDER since October 15, 1905, and have always found it to be a paper of practical and useful information, except the articles by George Rice—I fail to see any information of value in them. To my mind his writing will discredit the paper. I preserve every copy of it. The copies are far too valuable to throw away. Well, I have used enough space and time.

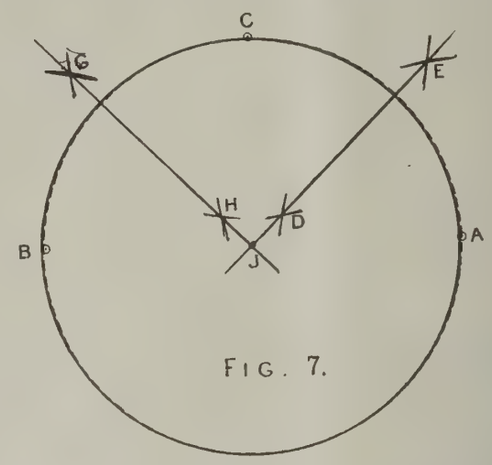
Respectfully yours,

Oil City, Pa. T. G. P.

OUR PRACTICAL COLUMN

A CIRCLE THROUGH THREE POINTS.

If you want to draw a circle through three given points *not* in a straight line proceed as follows and as shown in Fig. 7. Let A C B be the three given points; upon A and C with any radius greater than half A C mark arcs intersecting at D and E; upon C and B with any radius greater than half C B mark arcs intersecting at G and H; through E D and G H draw lines intersecting at J; upon J as center, with J C as radius, mark the circle through A C B.



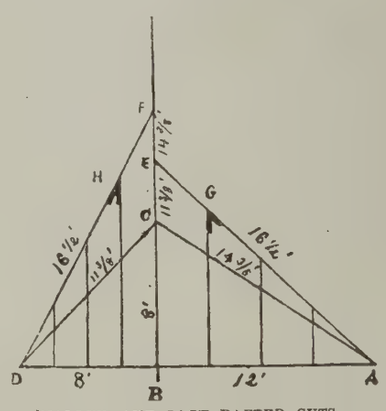


FIG. 7.

This system is often used in laying out circles or segments of circles when the center is not obtainable or cannot be found.

VALLEY AND JACK RAFTER CUTS.

The cut represents a building 24 feet wide, and one-third pitch, which gives 8 feet rise, with a pediment 16 feet wide and one-half pitch, which also gives 8 feet rise. As roofs of different pitches reverses the order of taking lengths and figures, it is difficult to keep the method clear in one's mind.

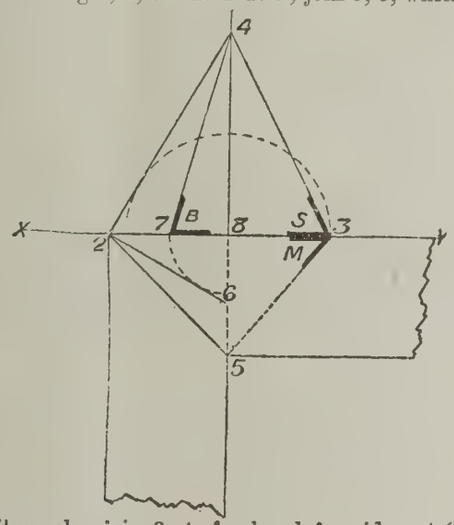
VALLEY AND JACK RAFTER CUTS.

Referring now to the cut, A, B is the run on the third pitch roof, B, D is the run on the half pitch roof, B, C is the rise of both roofs, A, C is the length of common rafter on the third pitch roof, and D, C is the length of common rafter on half-pitch roof. Set off length of common rafter on half-pitch roofs, as B, E, and set on length of common rafter on third pitch roof, as B. F. Connect A, E and D, F for position of valley rafter for finding the lengths and bevels of the different jacks. For the length of jacks on the half-pitch, space them on the run of third pitch, as shown from A to B, and draw perpendicular lines to valley line A, E, which gives length, and the bevel across the back is shown at G. The figures which give the cut for the bevel across the back of the half pitch jacks are 12 on tongue and 11⅜ on blade, the blade gives the cut. For the length of jacks on the third pitch roof space them on the run of the half pitch, as shown from B to D, and draw perpendicular lines to valley line D, F, which gives length, and the bevel across the back is shown at H. The figures which give the cut for the bevels across the back of the third pitch jacks are 8 on the tongue and 14⅜ on blade, the blade gives cut.

DIRECTIONS FOR TAKING BOARD MEASURE ON STEEL SQUARES.

The inch graduations on the outer edge of the square are to be used in combination with the fine parallel lines ruled lengthwise on one side of the square.

After measuring the length and width of the board, look under the 12 inch mark for the width in inches. Then follow the line on which this width is stamped toward either end, until you reach the inch mark on the edge of the square whose number corresponds with the length of the board in feet, and the number found under that inch mark on the line you are following will be the feet and inches contained in the board; the number to the left of the inch mark being feet, and that to the right inches.

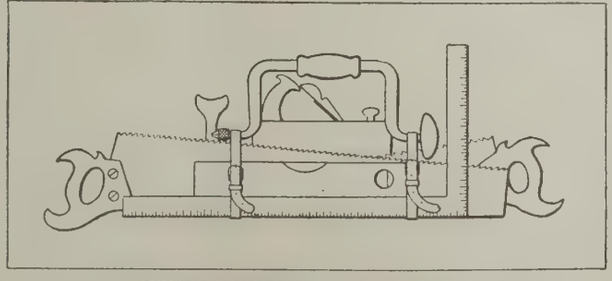


For example—Suppose a board to be 11 inches wide and 16 feet long:—Under the 12 inch mark, on the outer edge of the square find 11, which represents the width of the board in inches. Then follow out that line to the 16 inch mark, and you will find 14-8 which means that the board contains 14 feet and 8 inches.

This supposes boards to be 1 inch in thickness. In calculating plank or timber thicker than 1 inch, the result given on the square, is to be multiplied by the thickness. For example—If the above dimensions were for a plank 3 inches thick, multiply 14 feet 8 inches, by 3, which gives 42 feet and 24 inches, which equals 44 feet. Suppose it was a board ½ inch thick, multiply 14 feet and 8 inches by ½, which gives 7 feet and 4 inches.

Never use kerosene to clean a blued square.

BEVELS FOR MITERING HOPPERS.

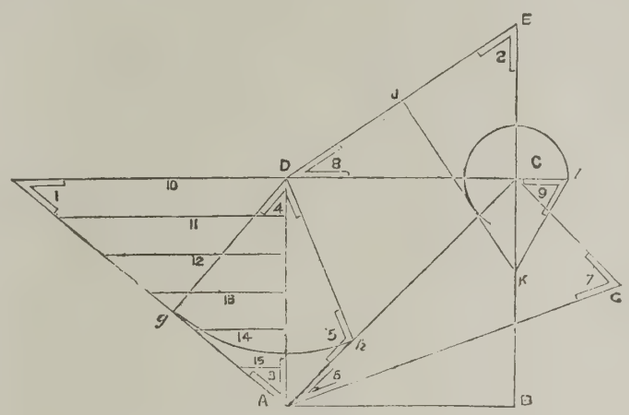


Draw part plan of hopper, 1, 2, 3, also 2, 4, which is inclination of hopper side; project up from 8 to meet. With 8 as center, and radius touching 2, 4, cut X Y at 3; join 3, 5, which gives bevel

"M" for mitre; also join 3, 4, for bevel for side cut "S." Sometimes hoppers are housed together. To get bevel for edge of stuff in the latter case, make 2, 6 square to 2, 4; with center, 8, radius touching 2, 6 cut XY in 7; join 7, 4; and the butt level as seen at "B." This method applies to square hoppers. The shape of the angle pieces is the same as in the backing of hip rafters.

UNIQUE HANDLE FOR CARRYING TOOLS.

Carpenters, electricians, plumbers and others having to carry tools any distance, may find the following suggestion of considerable assistance: Arrange tools into a compact parcel, leaving the brace



UNIQUE HANDLE FOR TOOL PACKAGE

out. Having procured two straps, put one around each end of bundle. Before buckling straps, place the brace on top of pack, then fasten straps over each end of brace, and you have a handle which will greatly reduce the tedium of carrying tools any distance.—Popular Mechanics.

HIP ROOF.

This diagram exhibits a short and correct method for finding the bevels for the different cuts, and also the lengths of the jack rafters required in the construction of a hip roof. Let A B C D be the horizontal plane, and C D E the elevation of one-half of the hip; prolong the line C D to F, and make D F equal to D E; joint F A and also A C; on the line A F let fall a perpendicular from D, meeting F A at g; take D for center and D g for radius, and describe the arc to meet A C at h; join D h. Square down a

line from C to G and make G C equal to C E; join A G, which gives the length of the hip rafter. The bevels: No. 1 is for the sidecut and No. 2 for the downcut of the jack rafters for fitting the side of the hip rafter; No. 3 is the sidecut and No. 4 is the downcut for the end of purlin to fit the side of hip rafter, and No. 5 is the bevel for backing the hip rafter. The bevels 6, 7, and 8 need no explanation. It may be remarked that the bevel No. 4 is only correct when the height of the roof is equal to one-third of its base; and when the height varies from that proportion, the method for finding the bevel is shown at C, which gives a correct rule under any conditions. From any point on line D E J square down a line meeting B C at K; from C as center, describe the arc touching the line J K, and meeting the end of the line D C at 1; join 1 K, and in the angle the bevel No. 9 is seen, and is equal to the angle No. 4. The jack rafters are Nos. 10, 11, 12, 13, 14, 14, and their lengths can be found exactly if a large scale is used—say 1 inch to the foot.

BOOK NOTICES

(Notice.—All books noticed in these columns may be obtained from this office at publishers' prices. All postage or express prepaid. Money and address must accompany all orders.)

WHITE PAINTS AND PAINTING MATERIAL: Source and manufacture; composition and properties; use and formulas; physical tests and chemical analysis. By W. S. Scott, C. E. Cloth, 493 pp. Published at "The Modern Painter" office, Chicago, Ill., 1910. Price, $3.50.

This work is evidently the result of much labor and thought and is seemingly one of the most comprehensive and thorough works on the subject of paints that we have come across for some time. Nothing seems to have been overlooked that would be considered necessary to a full understanding of the constituents of paints and oils. The physical tests which the author gives are of much more importance to the master painter than is a chemical analysis. Physical tests have been made a specialty, which renders the work quite valuable. The painter who follows closely the chapter on physical tests will be able to know all the qualities of the materials he makes use of in his work and will be able to employ them with great economy and efficiency by virture of the knowledge obtained from this chapter. Indeed, if there is any fault in the work, it seems to be in the lengthy and doubly clear descriptions the author gives in this special chapter.

In dealing with white pigments—particularly white lead—the same analysis has been adhered to throughout, and lead in all its forms and its results is dealt with at length, such as litharge, red lead and lead sulphides, along with zinc whites are dealt with in a plain and understandable manner—showing their qualities of endurance, color and adaptability.

Tables and formulas are given for the use of every possible kind of paint, mineral vegetable or otherwise, and showing the action of regents on the principle—white pigments, with directions how to use the formulas. Combination paints, oils, turpentines, benzine and all adulterations of paints are especially mentioned and described. Taking it all in all the work is a valuable addition to the literature of paints, oils, varnishes and pigments and, in our opinion, every painter or dealer in paints who is desirous of knowing much about the materials he uses, or deals in, should possess a copy of this valuable work.

ART-CRAFTS LAMPS—HOW TO MAKE THEM: By John D. Adams. Published by Popular Mechanics Company, Chicago, Ill. 87 pp. Cloth. Price. 25 cents.

This is another of those excellent hand books that are being published by this company, and is full of good and instructive material for the amateur mechanic. It contains 16 designs for lamps with details suitable for many places, but more particularly for the bungalow or summer cottage. It is illustrated with 17 well drawn illustrations in which the dimensions of the materials used are given—a very important matter to the amateur. The making of a lamp shade can easily be accomplished by anyone who will follow this book closely and who has any knowledge of tools and the manner of using them. For ladies who are fond of making fancy and unique articles in wood, brass, pasteboard, and glass, or combined, the making of these shades will give them ample opportunities to display their skill and good taste, and we can recommend this little low-priced book to every person who loves to use tools and "make things."

The book is well bound, printed on fine strong paper and is a marvel of cheapness.

HEAT: By J. Gordon Ogden, Ph. D., Professor of Physics and Chemistry, Fifth Avenue High School, Pittsburg. Strongly bound in cloth. 119 pp. Published by the Popular Mechanics Company, Chicago, Ill. Price, 25 cents.

This book is one of the series of handbooks on industrial subjects now being published by the Popular Mechanics Company of Chicago, and is a well thought out little work on the subject of which it treats. It deals with the nature of heat and how it is measured. How low temperatures are produced. The effects of low temperature upon some matters. The production and uses of high temperatures. The effects of high temperatures on the rare metals. How heat travels; how it is measured. Expansion and contraction. Energy and fuels. Manufacture of artificial ice; steam, boilers and engines. The application of heat to the many purposes to which it is now applied. The work is well illustrated, is plainly written, and full of instructive and interesting matter, and its low price (25 cents) places it within reach of everyone who desires to know anything about heat and its effects on the economics of nature.

BUILDING CONSTRUCTION: In two volumes. By Beresford Pite, F. R. I. B. A., Professor of Architecture, College of Arts. Frank T. Baggallay, F. R. I. B. A. H. D. Searles Wood, F. R. I. B. A. E Sprague, Assoc M. Inst. C. E. Published by Longmans, Green & Co., 39 Paternoster Row, London, New York, Bombay and Calcutta, 452 pp. Cloth. 1910. Price, 18s net.

Volume 1 is divided into three parts. The first part covering brickwork, sites and foundations, walls, piers, arches, ancient and modern brickwork, molded, plain and glazed brickwork. Second part covers stonework, materials, tools and methods of preparing. The third part covers carpentry in all its phases, including methods and materials, construction in metals, elasticity, nd strength of materials, beams and girders, struts and columns and designs of frame structures.

The work is decidedly the best text book we have seen for many years, as it covers nearly every subject within the scope of its intentions. It is a book which the ambitious student of building construction cannot possibly do without. It is furnished with a copious index, gotten up on a liberal scale and so arranged that the subject wanted can be obtained with very little trouble.

In the preface the editor says that the aim of these volumes on building construction, while treating the subject in a practical manner, is to give to it also architectural expression. With this object in view, the whole has been intrusted to well known architects for revision on these lines. Existing books on building construction are, in most cases, excellent in many respects, but often fail to place before the students the treatment which is necessary, if buildings are to be, not only sound, but also architecturally satisfactory. Building construction in itself is merely a skeleton. Its effective covering is architecture, skilfully applied.

While this book is English and many of the methods described are English, and not in use in the United States, yet the greater part of its contents will appeal to American constructors and workmen in general.

BACKBONE OF PERSPECTIVE: By T. W. Taylor, C. E., University of Virginia, M. C. E. Cornell University, Professor of Civil Engineering, University of Texas, Member Am. Soc. C. E. 56 pp, 40 illustrations and diagrams. Cloth. Published by the Myron C. Clark Publishing Company, Chicago. Price, $1.00.

The author of this little book attacks the question of perspective on much different lines than the usual ones adopted by authors who write on this subject. Mr. Taylor seems to have grasped the subject of perspective, and so simplified and condensed it, that any intelligent person should be able to understand the whole theory of perspective after carefully reading the book.

The different phases of perspective are exhibited and fully explained, and the low price of the book places it within reach of every ambitious young draughtsman in the country, and we can heartily recommend it to those of our readers who are reaching out for better things. It is printed on fine, strong paper, from good sized type and is durably bound.

TWENTIETH CENTURY SHEET METAL WORKER: A modern treatise on modern sheet metal work. By H. E. Osborne. 86 pp. Illustrated. Cloth. Published by the American Artisan, Chicago, Ill. Price, $1.00.

This is an exceedingly useful book for tin and sheet metal workers, as it shows and describes the methods of laying out the lines through which the metal may be cut to form the various shapes for all sorts of work required in the making of household utensils, cornices, sheet metal piping, water troughs, fittings, and roof coverings of every description.

KEY TO THE STEEL SQUARE.

The above title is the name given to an ingenious little instrument, perfected by the well known authority on the use of the steel square, Mr. A. W. Woods, which is meeting with a good sale throughout the country. With it, anyone can instantly find what figures to use on the common steel square for the rafter cuts, together with their lengths from one to twenty-four inch rise per foot run. Having the lengths given decimally for one foot run, it is an easy matter to find the lengths for any run.

The instrument is about three inches in diameter, on either side of which is pivoted at the center a disk—one side giving the length and cuts of the rafters, while on the other side is given the table for finding any angle in degrees. By turning the disk until the slot in same rests opposite the pitch or angle desired, only the figures for the lengths and cuts for that pitch, or angle, will be exposed, thereby preventing errors.

Fig. 1 shows the disk set opposite the 5/12 pitch. Note the figures at the top of the slot is 10 and represents the rise to the foot run. The next is 15.62 and represents the length of the common rafter. The next is 16.4 and represents the length of the hip or valley; 5/12 opposite the slot represents the pitch. .42 is the equivalent of 5/12 expressed in decimals. The latter is given as a handy reference to translate decimals to common

FIG. 1.

fractions, so that the same can be more readily found on the steel square. Thus, the fraction .62, as shown in the slot, is equal to 5/8 of an inch. .4 is practically 5/12 and .69 is between 2/3 and 17/24 of an inch, either being practical. Just above the slot are shown 12, 13 and 17. These are set numbers and represent the figures to use on the tongue for the seat cuts of the respective rafters, while just above is given the abbreviated instructions for the side cuts.

In Fig. 2 is shown the application of the square to the timbers for obtaining the cuts as follows:

Referring to the illustration at A, 12 and 10 will give the seat and plumb cut. The length for one foot is 15.62 and this taken on the blade and 12 on the tongue will give the side cut of the jack, the blade giving the cut. These same figures will give the cut across the face of the board to fit in the valley, or over the hip; the tongue giving the cut. By taking 5 on the tongue and 15⅝ on the blade, the latter will give the side cut of the jack to fit against the octagon hip. At B is shown the application of the steel square for the seat and plumb cuts of the octagon hip or valley. At C is shown the application of the square for the seat and plumb cuts of the hip or valley. Its length for the corresponding length of the common rafter is 19.69 inches and this taken on the blade and 17 on the tongue, will give the side cut of the hip or valley; the blade giving the cut.

Other pitches are treated in the same manner. Much other valuable information is contained in the key, all of which is explained in book of instruction, together with a neat morocco case, suitable for carrying in the picket, is given with each book and key. In short, it is a ready reckoner and a great time saver to the possessor of one of these instruments. The above description applies only to the rafter side of the instrument.

The retail price is $1.50, postpaid, and can be had from THE NATIONAL BUILDER.

ASBESTOS "CENTURY" SHINGLES

"THE ROOF THAT OUTLIVES THE BUILDING"

Loss by fire is the one risk that the property owner dreads most. He is so entirely at the mercy of carelessness or negligence on the part of his neighbors.

In nine cases out of ten where a fire starts outside the building it catches the roof.

Asbestos "Century" Shingles are absolutely fireproof because they are made of reinforced concrete. And more than that—they are light in weight and can be laid so they hold up even when the roof frame is weakened by fire within the building.

Asbestos "Century" Shingle Roof—Tipple and Coal Bin of the New River Collieries Co., Sun, West Virginia

Asbestos "Century" Shingles are made of hydraulic cement reinforced with interlacing Asbestos fibres—compacted by tremendous pressure.

They are indestructible by weather or time and they grow harder and tougher with exposure. No repairs—no painting.

You can get Asbestos "Century" Shingles in numerous shapes and sizes to fit any architectural scheme. Three colors—Newport Gray (silver gray), Slate (blue black), and Indian Red. Ask your roofer for new quotations. Write for Booklet K. & M. 1911.

The Keasbey & Mattison Company, Factors, Ambler, Pa.

THE WASHINGTON RED CEDAR SHINGLE.

It is only about twenty years since the manufacturers of lumber and shingles were forced, through the scarcity of timber in the other sections of our country, to begin to draw on the supply of the Pacific Northwest.

One of their first important finds was that the red cedar of the state of Washington could be manufactured into shingles that were as near perfection as any shingle made.

This is extremely reasonable, for when you stop to consider that the red cedar shingle is manufactured from the really wonderful red cedar trees—some of them six hundred years old, many of them towering two hundred feet and over, into the air, and having a base diameter of eight feet and over—which have withstood the ravages of the elements for centuries—it is easy to see why a roof covering, or siding covering manufactured from this material from nature's storehouse, is almost indestructible.

A home builder is interested chiefly in two things; first, he must build a house that will stand—but even the inartistic man appreciates things that are beautiful, and it is the aim of every home builder to not only build substantially, but to build a home that will be really beautiful.

Washington red cedar shingles are beautiful shingles. Even if unpainted or unstained, their light reddish hue makes them attractive, and it has been proven that these shingles, not only readily absorb stains and paints, but hold them, and the best of permanent attractive color effects can be obtained.

The shingle manufacturers on the Pacific Coast realize fully that there is a market for their product in all parts of this country, and it is not surprising to know that some of the Pacific Northwest wholesalers are shipping these shingles in large quantities to the New England states, and also to the Southern Gulf Coast states (the field at one time held exclusively by other shingles), as well as to the state of California, itself a shingle producing state.

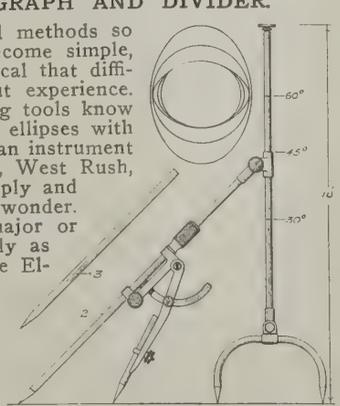
A WONDERFUL PRODUCT.

A sample of Lignine Wood Carvings, unwrapped and unprotected, recently reached us by mail, in perfect condition, and when we say Lignine Wood Carvings are a wonderful product it little expresses it. The fine condition of this sample seems to prove the claims of the makers.

To be able to reproduce oak, mahogany and walnut with full depth of grain, showing distinctly the flakes and chisel marks, is a remarkable achievement.

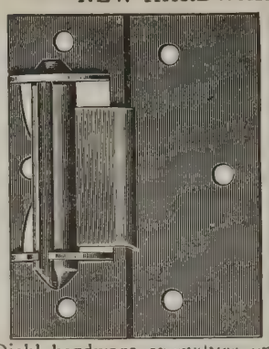
Ornamental Products Company of Detroit, Mich., claim that their carvings are stronger and more durable than wood. They claim that their products will not chip, check, crack nor shrink. They wish to prove it to all users of carvings.

The superior quality of their carvings is easily understood for the reason it costs no more to make designs of good detail than those of poor effect and as they cut but one master model, it is a good one.



The price of Lignine Wood Carvings is many hundred per cent cheaper than hand carvings and this appeals to the manufacturer.

Lignine Wood Carvings have been on the market five years and have saved the manufacturer thousands of dollars.



A post card will bring to our readers a sample of Lignine Wood Carvings and their beautiful catalogue. We are sure you will be glad to have these. In writing mention THE NATIONAL BUILDER.

THE KELLEY ELLIPSOGRAPH AND DIVIDER.

Inventive genius has simplified methods so that the almost impossible has become simple, and in numerous cases so mechanical that difficult problems are handled without experience. All with any knowledge of drawing tools know how complicated is the striking of ellipses with the ordinary tools. Quite recently an instrument has been invented by J. T. Kelley, West Rush, N. Y., that does this work so simply and easily that it is little short of a wonder. It will draw an ellipse of any major or minor axis as easily and accurately as a compass will strike a circle. The Ellipsograph can be readily and instantly adjusted for any desired ellipse or curve, and is so simple in construction that anyone can understand and use it at once for the most difficult work. It is a valuable aid to the draftsman, pattern maker, carpenter, builder and contractor. The Kelley Ellipsograph is positively guaranteed and sold at the low price of $3, carrying charges prepaid. Address, J. T. Kelley, West Rush, New York, and mention the NATIONAL BUILDER.

NEW HARDWARE SPECIALTY CATALOGUE.

The Diehl Novelty Company's new catalogue for 1911 is now ready for distribution and will be mailed to any of THE NATIONAL BUILDER readers on request.

The Diehl line of hardware specialties are not only novel but practical and durable, and right up-to-date in every way. Mr. Diehl, the inventor of these specialties, personally attends to the manufacturing end and guarantees that they are made with great care and accuracy.

The Diehl Novelty Company are putting out some specialties this season which they state will be of interest to all carpenters and builders, as well as to the consumer. Many difficulties will be overcome and considerable saving made by using the Diehl hardware specialties on every job. The accompanying illustration shows their new separable and reversible hinge No. 20, designed for storm and screen doors.

This hinge is made of open hearth, wrought steel, 14 gauge, and finished in black baked japan or oxidized copper. A sample set of hinges will be sent for 25 cents in stamps nd you can get a new catalogue at the same time.

A ONE MAN PORTABLE DERRICK.

The cut below shows the Taylor Portable Steel Derrick manufactured by John L. Taylor, the inventor, 1034 W. Lake street, Chicago, and is one of the most useful articles a contractor can possess for hoisting all kinds of materials. This derrick is constructed entirely of Malleable Iron and Steel, which makes it far superior in strength and durability than if ordinary metals were used. It is made in two sections so that one man can handle it and place in position for operation or shift its position. To erect, the base section is first attached to the joists or scaffold, and the top or beam section slipped on the base without the use of bolts or screws. Clamps are furnished with the base making bolts and lag screws unnecessary to make it rigid.

The drum will carry two hundred feet of quarter-inch cable and is attached to beam section. The operator stands directly behind the derrick and works a crank with each hand, getting more power by a push and pull motion at the same time. Another essential feature is the swivel hook which allows the twist in a cable to unwind. The beam section has a circle swing and is also equipped with two pulleys at top which give it adjustable capacity and speed.

This machine is the result of long experimenting and practical tests and is highly recommended by present users. Its one man portable features and easy operation are time savers as well as its strength by being constructed of malleable and steel. You will be much interested in the catalogue which will be sent on request.

Asbestos "Century" Shingles are continually gaining in favor. Their many advantages have resulted in their being used on thousands of buildings in this country and Europe. Among recent orders is one for several carloads to be used on the Pennsylvania State South Mountain Sanitorium for Tuberculosis. Orders in hand for further operations in other sections of Pennsylvania will require twenty carloads. Other recent orders received by the Keasbey & Mattison Company include the government buildings at West Hingham, Mass., which require several carloads the Atlantic City pumping station, Absedon, N. J.; the Hartman Stock Farm, Columbus, Ohio, and the Pabst Stock Farm, Oconomowoc, Wis.

For Temperature-Proof and Sound-Proof Walls, Floors, Ceilings

LINOFELT

Linen Felt made from Flax Fibre

Is the only Good Building Quilt to Use in the Walls of Your House to Make Separate the Outside and Inside, the Heat and Cold, the Sound and Quiet

It is an insulating quilt—made from flax—the lightest quilt cubical contents considered—does more than what building paper is "supposed" to do—keeps residences and buildings warm in winter, cool in summer—saves 40% of fuel bills—is sanitary, odorless—the best sound deadener—same sound heard 200 feet through boards is heard only 2 feet through **Linofelt**—makes homes quiet and restful—equally valuable in Northern and Southern climates—no home is too small to afford **Linofelt**.

Linofelt has been determined by hundreds of architects, builders, carpenters, property owners all over the continent to be best for insulating walls, ceilings, floors. All know **Linofelt** is more than 38 times as effective as building paper *by test.*

To Architects, Contractors, Carpenters

We have never failed to get the enthusiasm of architects, builders and carpenters who have become acquainted with **Linofelt.** All dislike building paper. Our beautiful FREE book is crowded with details, methods, plans, building and residence data, the results of tests—also information about Lith Board and Rock Wool. Send for your book today; and let us offer you our service covering planning of buildings you have in contemplation.

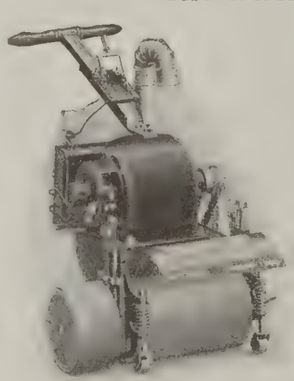
NICHOLLS GUARANTEED TOOLS.



The Nicholls Manufacturing Company, Ottumwa, Iowa, have been offering some very good bargains in their advertisements in THE NATIONAL BUILDER. Their True Mitre Box, with its positive center and octagon stop, which, with the mitre stops, will take in 95 per cent of the work done with mitre boxes, is one of the useful tools they call attention to. The Nicholls New Sawtooth Roller Marking and Mortise Gauge, is a late addition to the Nicholl's line. By making this gauge with a sawtooth wheel, it runs true with the edge of board, regardless of knots or cross grain wood. The line made by the wheel is easily seen, as the marks are like punch marks and reflect the light from all sides.

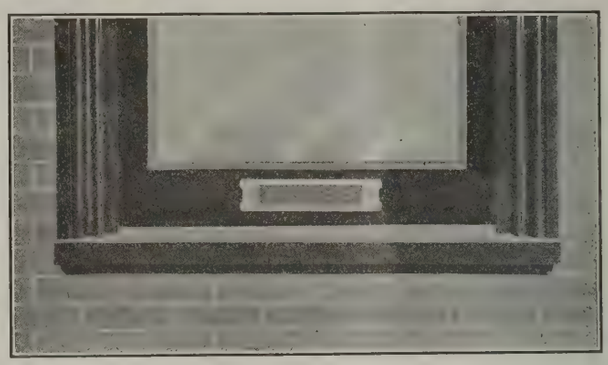
This is the actual picture of a Nicholls Hardened Corner Square, with which we chiseled out this brick, showing what their hardened corners will stand. See how sharp the corner is.

The Nicholls Hardened Corner Framing and Standard Squares are well known to every carpenter and contractor in the United States. These hardened corner framing squares have become very popular. They are made in polished steel, oxidized copper and nickel plated, and are a mighty fine square in every way. All Nicholls tools are guaranteed and can be had from the dealer—or direct from the factory if the dealer will not supply the carpenter or contractor with them.

THE RAPID FLOOR SURFACER.

Floor surfacing is one of the difficult problems when installing floors that necessitate an even and smooth surface. The machine here shown is the Schlueter Rapid Floor Surfacer, manufactured by M. L. Schlueter, 103 North Canal street, Chicago, Ill., and embodies the correct methods in obtaining these results.

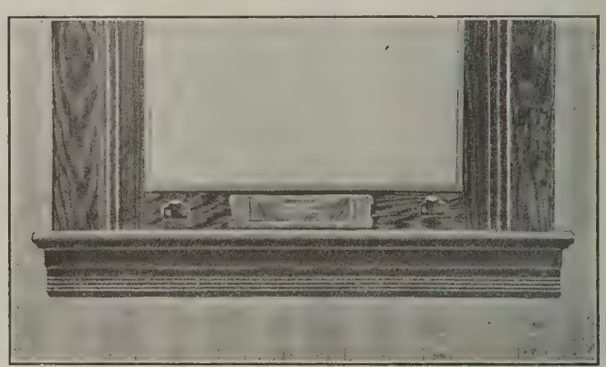
It is constructed for one man operation and sands the floor, removing all roughness and raised portions and gives the floor a fine sandpaper finish. Each machine is equipped with an automatic dust collector, making it possible to surface floor in the finest residences, offices, etc., without inconvenience and annoyance, also this prevents dust from injuring working parts of machine.



The sanding roller is covered with pure rubber, which forms the cushion on which is clamped the surfacing or polishing materials (sandpaper or cloth) to be used. This roller is held in place by side plates with springs, allowing the roller to adjust itself to the floor.

When starting the motor the roller cannot grind into one spot on the floor, as the machine is so constructed that the operator can leave the machine without stopping the motor, as the roller is automatically raised from the floor the moment the handle is released.

Contractors and builders having floor surfacing to do should send for full particulars and free trial proposition. This machine is made in several sizes.

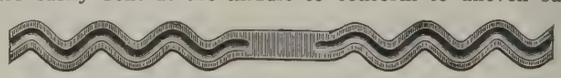


A SASH VENTILATOR OF REAL MERIT.

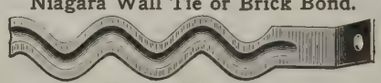
Natural ventilation simply means the withdrawal of foul air and the admission of pure air in a natural, not forced manner. If it comes in small quantities through cleanable screens, so that no dirt, rain, snow or drafts reach the interior and the device is not cumbersome or costly, every builder and contractor will agree that a big problem in ventilation has been solved. Methods of mechanical ventilation in washing the air are expensive to install and costly to maintain. For three years expert inventors and practical builders in Erie, Pa., have combined their efforts with

a view to lessening the disadvantages and removing the defects of existing room ventilators, so that a scientific, simple and non-expensive device could be perfected.

They have recently succeeded and the Ideal Manufacturing Company are flooded with orders from Maine to California. Greatly enlarged facilities now permit the immediate shipment of ventilators. The Ideal can be quickly fitted by a carpenter into any sash over two inches deep and one and three-eighths inches thick, or, if preferred, it is furnished in a special rail to go under a raised sash. Sleeping rooms, bath rooms, offices, school rooms, churches, public buildings when equipped with the Ideal Sash Ventilator, give that comfort to the occupants only known to those



who insist that pure air is essential to real health and happiness. Fresh air indoors means practically exemption from colds and coughs. The ventilator is adjustable to any air current and can be fitted into either the upper or lower sash. The slant of the device permits moisture to run out. The finish is plain or to match the rest of the hardware trim and of non-rustable material throughout. The retail price of a single ventilator is $1.50, with liberal discounts to architects, builders, and contractors. The advertisement of the company appears elsewhere and correspondence is invited.



The Ideal Ventilators are commended after investigating their construction, and conversation with those who had used them for a year or more with absolute satisfaction.

GALVANIZED WALL TIES.

Contractors and builders who have suffered annoyance and loss from wall ties that give and become useless, will be interested in Niagara Wall Ties, which are scientifically perfect, having the principle of the keystone, and offering greater resistance than any bond on the market. A hollow wall, when the wall ties are used, is stronger than a solid wall of the same thickness where they are not used. They are easily bent at the middle to conform to uneven surfaces.

Niagara Wall Tie or Brick Bond.

Niagara Veneer Tie or Brick Bond.

The veneer ties are bent at the end and have a hole punched, ready for nailing, and are fastened to the sheathing easily and rapidly with a common nail. Under any ordinary circumstances, it is impossible to produce the slightest approach to a separation of the parts. Every architect should put wall and veneer ties in his specifications, as every building contractor needs them.

Any contractor or builder will do well to write on his letterhead to the Niagara Falls Metal Stamping Works for Folder 14 NB, which illustrates a line of builders' goods, including sash pulleys, sash chain, etc. Their address is 127 10th st., Niagara Falls, N. Y.

Washington Red Cedar Shingles Defy the Weather

It is a fact. Wooden shingles, made from the red cedar of the State of Washington, are as near "absolute perfection" as any known shingle. A red cedar shingle rightly painted the right kind of a shingle stain is as good will last for twenty years, and many such roofs have stood the weather for longer.

When a man builds a home, he wants first: utility, then beauty. Even the man who is not artistic, appreciates and wants the beautiful things. And only with wooden shingles, and the best of wooden shingles, can utility and beauty be combined in their highest degree.

"BUCKEYE BRAND" RED CEDAR SHINGLES

Are picked shingles. Only the best of the best are worthy to be stamped with this name. On shingles it is a quality mark. Your retail dealer can get them—and will be glad to, if you ask and insist on them.

—Courtesy of Keith's Magazine.

RED CEDAR SHINGLES ARE BEAUTIFUL AND ECONOMICAL

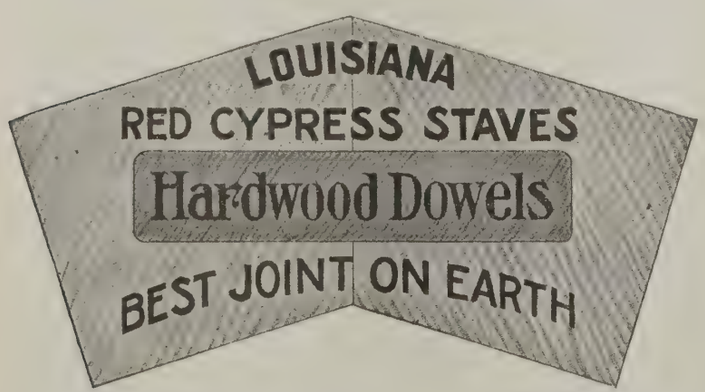
NEW CONSOLE DESIGNS.

The console design shown in the Northwestern Grille Works' advertisement on another page in this issue is their No. 657. The stock used is quarter-sawed oak and birch, the height is 86 inches, and width 60 inches, with plain mirror 30x50 inches. There are two leaded lights, 8x46 inches, case is 8¼ inches deep, clear, and each console has rubbed and polish finish.

The console shown in this article is another very attractive design, and also an exceptionally well made console in every way. This console is 88 inches in height, width 60 inches, glass opening 34x54, column 6 inches, and wood stock is quartered oak, rubbed and highly polished finish.



This is only one of the many beautifully designed consoles manufactured by the Northwestern Grille Works, 1824 Milwaukee avenue, Chicago. The new catalogue being made up now and ready for mailing in about 60 days contains many original console, grille-colonial openings, sideboard, buffets and china closet designs. The Northwestern Grille Works have been selling direct to the NATIONAL BUILDER subscribers for nearly ten years, and are held in high esteem by their customers. They use the best of materials, employ experienced workmen and do everything possible to give each customer a square deal.

Working along this line, and doing business continuously at their present location, they have built up a large trade among contractors and builders all over the country. The new catalogue will be mailed when off the press to architects, contractors and builders who are on their list, and if not already on, it would be a good thing to drop a line now for a copy.

THE HUBER CYPRESS COLUMNS.

The Huber Builders' Material Co., 39-43 Vine street, Cincinnati, Ohio offered a number of attractive bargains in last month's NATIONAL BUILDER. The line shown in their advertisement consisted of a front door, cottage window, yellow pine stairs and newel casing, base, quarter round, grille and a Huber cypress colonial column.

Many of our readers will be especially interested in the cypress columns at this time, when so much is being written in praise of "Cypress, the Wood Eternal," as it is called. Mr. Gustav Stickley, the well-known craftsman, states that it is the best American wood for all exterior use, such as shingles, timbers, pergolas and all mill work subject to weather. Its slight natural oil makes it practically impervious to moisture, so that it does not shrink or swell like other woods, and it is very durable when protected by merely a coat of oil.

So in offering their carefully selected genuine Louisiana red cypress porch columns, the Huber Builders' Material Co. claim they are manufacturing and selling a column which will give perfect satisfaction for the longest time. They state that they "air-dry" their lumber for at least one year, eliminating as much contraction and expansion as possible. It is this expansion and contraction that causes solid or other columns to sometimes split or open up badly at the joints. The Huber cypress colonial columns are built under the wooden dowel system, and dowels were used by our forefathers to hold the framework of the largest buildings in permanent position,

Simonds Saws

THE very first step taken toward making a Simonds Saw—the making of the steel—is specialized under a Simonds Process. By it we produce Simonds Special Crucible Steel—for Simonds Saws only.

No other process produces a better steel for Saws. It is tough, flexible, with a temper taking quality that makes it when treated, tempered, ground. finished, and made into a saw blade, in the Simonds way, in the Simonds shops, the best saw that can be bought at any price.

Another thing: should even the slightest defect crop up in a Simonds Saw, while in the process of making, that condemns it to the scrap heap. Remember you can always be sure of buying high grade quality when you buy a **SIMONDS.**

To buy the right saw, let it be rip, hand or panel, see that the Simonds (Si-monds) name is on the **BLADE.**

Let us send you a free copy of Simonds "Guide for Carpenters." Tell us what kind of a Saw you will need soon.

and they are also used in the construction of high-class furniture, and today in fully 95 per cent of the doors manufactured in this country. The Huber cypress columns have special construction features in the staves, and waterproof glue used. The smooth satin finish found only in Huber columns is obtained by a method distinctively belonging to the manufacturer of this line of columns. These columns are primed with pure white lead and linseed oil, insuring protection from the weather and making the best possible foundation for further painting.

The manufacturers have just added a new and most important feature to these Huber columns. Two thick, round blocks of wood are glued on the inside several inches from each end, which protects them from being damaged by the rough handling usually given columns in shipping. Wooden strips are nailed on the outside, full length of column, insuring delivery in first-class condition. The Huber Builders' Material Co., 39-43 Vine street, Cincinnati, are getting up a new catalogue fully describing their Dowel Joint Colonal Columns and other millwork specialties. They take special care in attending to inquiries and orders, and claim that the prices quoted on their line are the lowest, when quality of material, workmanship, etc., are considered, that can be had.

MANTELS OF QUALITY.

An artistic mantel adds a tone of luxury and refinement to a room that is afforded no other piece of furniture. When buying it is well to select from the line that is designed by the most famous artists and designers and from a company that is well established and known.

The Central Mantel Company, 1237 Olive street, St. Louis, Mo., have been in business for many years. They employ the most skilled talent in every department and are equipped to turn out strictly high class goods and by making them in large quantities and selling "direct to the consumer" they state they can save the buyer from 35 to 50 per cent on every purchase and at the same time give perfect satisfaction to the buyer.

The $25.85 mantel offered in their advertisement in this issue is furnished in select oak or birch, mahogany finish. The price includes their Queen Coal Grate with best quality of enameled tile for facing and hearth. The mantel is 82 inches high, 5 feet wide. It is furnished with round or square columns, full length or double. The gas grate is $2.50 extra. This $25.85 mantel is one of the Central Mantel Company's best sellers and they state it is really a $40 mantel.

The design shown with this article is a higher priced mantel than the one described in the Central Mantel Company's advertisement. It is of the French style of architecture during the period of Louis XV and is a very rich design and in strict accordance with that period.

Special attention is called to the size of the mirror and to the height of the mantel. The careful detail of the mantel in its every part, especially carvings, which are cut by skilled mechanics, will not escape the eye of those who are lovers of art and who buy with a view to obtaining the best. This mantel can be furnished in mahogany or white enamel finish and where something especially nice is desired, it will add greatly to the attractiveness of any room.

The Central Mantel Company will send free to carpenters, contractors and builders, a 112 page catalogue which they state is the finest ever issued and which contains illustrations of a line of mantels which can give our readers an unusually large number of beautiful up-to-date designs to select from.

A GREAT RECORD.

It is with much pride that the A. S. Aloe Co. refer to their business career of sixty years. With this long experience in handling supplies for architects, engineers, draftsmen and builders, the Aloe Co. are in the position to give the best quality at the lowest prices. Their latest catalogue is now ready, and embraces civil engineers' and surveyors' instruments, material for architects and draftsmen, draughting room furniture, blue and black print papers. The central geographical location of the A. S. Aloe Co., 511 Olive street, St. Louis, Mo., enables the company to fill all orders with the utmost promptness. As their valuable new catalogue shows the latest improvements in instruments and supplies, it will be in large demand. The Aloe Co. make the liberal offer to send the catalogue free upon request. Better send a postal at once and mention the NATIONAL BUILDER.

GREAT NORTHERN RAILROAD EXHIBIT CAR EXPLOITING WASHINGTON RED CEDAR SHINGLES.

The railroads of our country are great opportunity builders, and one of the prime reasons why this is true, is their loyalty and willingness to advertise and exploit the good products in their territory.

Mr. James J. Hill, who, so far as the northwestern section of our country is concerned, deserves to be called the "Master Builder," is, through a number of exhibition cars, showing the various products of the northwest section, and thus doing some splendid exploitation work for this part of the country.

Exhibit of R. J. Menz Lumber Co., Alaska-Yukon-Pacific Exposition, Seattle, Washington, 1910. Awarded Five Grand Prizes, and the only Double Grand Prize to Any Exhibit of this Character

It is noteworthy that part of an exhibit of Washington red cedar shingles, which was shown at the Alaska-Yukon-Pacific Exposition, by the R. J. Menz Lumber Co. of Seattle, Wash., was chosen by the Great Northern Railroad as the best exponent of the Washington red cedar products. This exhibit was awarded in addition to several grand prizes, the only double grand prize awarded a shingle and lumber exhibit, at this exposition.

On the roof of the cottage among the trees shown in the accompanying illustration are the red cedar shingles for which the state of Washington is famous the world over. It is claimed that there is no roof covering equal to the Washington red cedar shingle. Of all roof coverings provided by nature or by man, it is the one least affected by climate changes.

Annual shipments of red cedar shingles from Washington Mills located west of the Cascade mountains, approximate 25,000 carloads. The Washington red cedar shingles displayed in the Menz exhibit, embodied all the varieties manufactured on the Pacific Northwest coast, in 16-, 18- and 24-inch lengths and they were all of the "Buckeye Brand" which brand is registered and handled exclusively by the R. J. Menz Lumber Co. of Seattle, Wash.

The use of the "Buckeye Brand is limited to red cedar shingles that will exactly conform to the descriptions incorporated in the name stencil. The keynote of the successful introduction of "Buckeye Brand" shingle to the Eastern trade is shown in the motto "If Better Shingles Could be Made, We Would Make Them."

The R. J. Menz Lumber Co.'s "Buckeye Brand" red cedar shingles are sold through dealers, the advertisement in this number being placed before the NATIONAL BUILDER'S readers in order that when specifying or buying wood shingles they can secure a shingle which is so good that the manufacturer is willing to place his brand on them.

The R. J. Menz Lumber Co., Seattle, Washington, issue a catalogue descriptive of Pacific Coast products which is very interesting and instructive. They will be glad to correspond with dealers, architects, contractors and builders interested in "Buckeye Brand" of shingles.

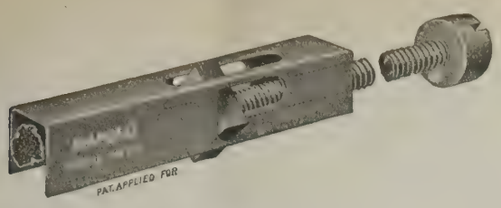
DIAMOND TOGGLE BOLT AND HEAD.

Diamond Toggle Bolts are made with pressed heads in one piece, no rivets.

An ordinary stove bolt nut is inserted in the slot as shown, and when bolt is inserted is locked into the toggle head.



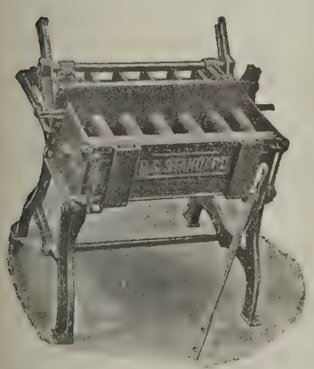
This type of toggle is recommended for its great strength, the nut of the stove bolt having direct bearing on both sides of the head against the surface of the hollow wall to which it is attached.

It will sustain the same amount of weight as a stove bolted through the wall.

Diamond Toggle Bolts are so designed that as soon as the bolt is

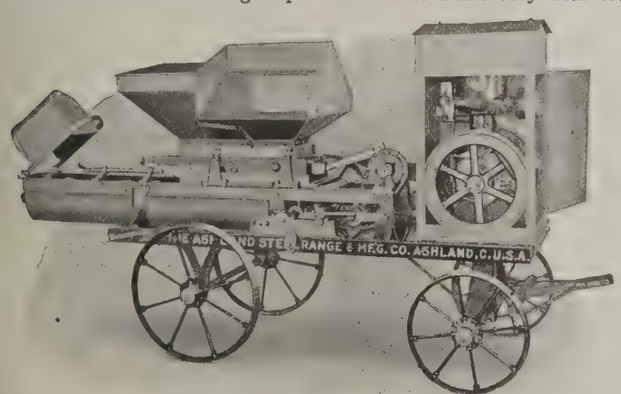
PASTE THIS DOME ON LETTERS THAT YOU WRITE ADVERTISERS. IT WILL HELP.

turned the job is finished, no cutting off of thread ends being necessary.



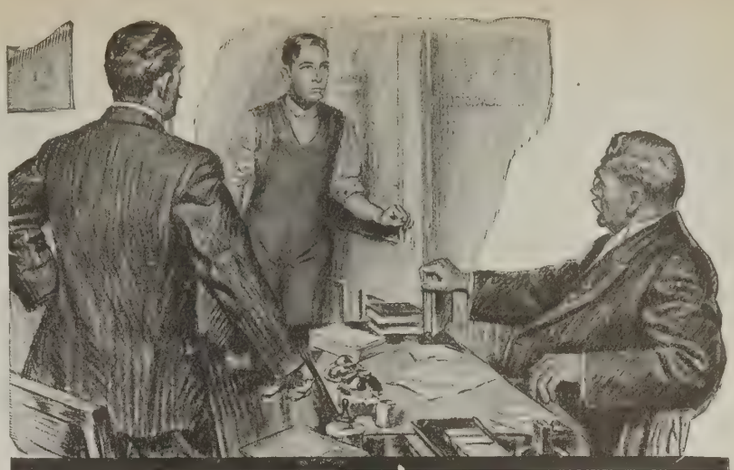
These bolts are another of the improvements for which the manufacturers of the "Diamond Specialties" are famous. For further descrip-

tion and prices address Diamond Expansion Bolt Company, 90 West street, New York.



ECHOS FROM THE LATE CHICAGO CEMENT SHOW.

The Chicago Cement Show has once more passed into history. Competitors met in friendly contest and gracefully submitted their cases for decision to an intelligent and interested body of concrete workers. These men are no longer novices when it comes to detecting real merit in concrete machinery. For this reason, a line such as our U. S. Standard concrete mixers and cement building block machines may expect only good results from such a contest. Never has a similar exhibition brought us as many actual sales, nor as many complimentary comments. The reason is obvious. For five years the U. S. Standard machines have made for themselves an honorable record in every state of the Union. They are no longer an experiment, and people are not afraid of them as they would be of a new and untried machine.



The U. S. Standard Junior and Senior Block Machines manufactured by the Ashland Steel Range & Manufacturing Company are both built upon the same basic principles, the former building a 16-inch, the latter a 24-inch long block, and all fractional lengths thereof. Both of these machines build hollow blocks 6 inches, 8 inches, 10 inches and 12 inches thick and veneer blocks 3 inches, 4 inches, 5 inches and 6 inches thick. The equipment also provides plates for circular blocks, angle blocks of any desired angles, porch pier blocks, chimney blocks, etc. These machines are capable of producing a greater variety of styles and sizes of blocks without additional investment than any other machine made, and for simplicity, speed, completeness, strength and beauty of blocks cannot be equaled.

The Ashland Steel Range & Manufacturing Company's U. S. Standard mixers are continuous mixers. The measuring and proportioning of the cement, sand, gravel or crushed stone is done automatically. With the U. S. Standard measuring is positive and does not vary with coarse

or fine, wet or dry ingredients. Special features are accuracy in measuring, correctness in proportioning and thoroughness in mixing the ingredients. All these operations are automatic and absolutely reliable.

The Ashland Steel Range & Manufacturing Company, Ashland, Ohio, will forward upon request descriptive literature to the NATIONAL BUILDER readers as will aid in selecting such machinery as will be best suited for their special needs.

Will YOU Be Ready When YOUR Chance Comes?

Will YOU be chosen as the right man when the big opportunity comes? Are YOU better prepared to rise from the ranks than the men beside you?

Could you fill satisfactorily a position requiring knowledge of "hows" and "whys"? Could you direct the work of others so as to get the best results? Would any employer be safe to trust your planning and figuring and doing?

To make it short, have you **any** special equipment? Is there **anything** in you to command big pay?

Every month three hundred like you are writing voluntarily to Scranton to tell of positions bettered and salaries increased through study of I. C. S. Courses. They not only waited and watched for Opportunity, but **prepared** for him. And when he came they were ready.

Now they are giving orders instead of taking them. Now they are salaried men instead of mere wage earners. Now they are free from worry about age limits, hard times, etc.

Through study of I. C. S. Courses, shop hands have become draftsmen, foremen, and superintendents; carpenters and masons have made themselves contractors, architects, or structural engineers; clerks have advanced to high-salaried places as advertising men, window trimmers, show-card writers, or chemists; farmers' sons have mastered electrical or civil engineering; miners have qualified for positions as inspectors, foremen, superintendents, or mining engineers; firemen have won quick promotion through study of steam engineering; young men everywhere have prepared for Civil Service positions, or studied successfully surveying and mapping, bridge engineering, illustrating and designing, gas engineering, automobile running, sanitary plumbing, textile work, navigation, or some other occupation covered by one of the 214 Courses of the I. C. S.

It will cost you nothing but postage to learn all about the salary-raising plan of the I. C. S.

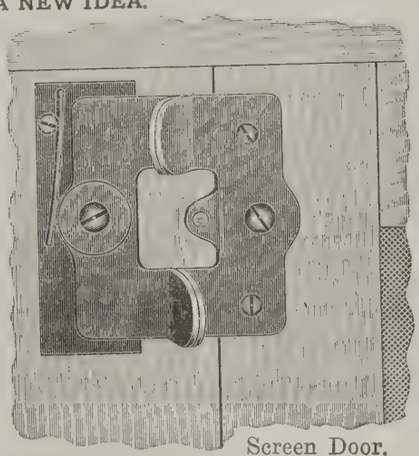
THE INFLUENCE OF SHINGLE STAINS UPON THE DEVELOPMENT OF THE SHINGLED HOUSE.

It is not too much to say that the invention of shingle stains has made the wide vogue of the shingled house possible.

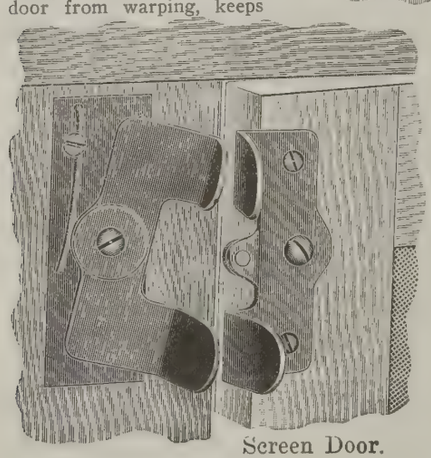
It was known from the first that paint was not fit to put on shingles, because it would cause them to rot more quickly than as if they were not treated, and the coloring effect was not artistic. Paint forms a coating over the surface of the shingle and prevents the escape of the moisture, which it is impossible to entirely keep out of the shingle. This hastens decay, and painted shingles are often found which look sound, but are really nothing but a crust of paint.

The invention of shingle stains by Mr. Samuel Cabot, chemist, of Boston, in the early 80s, solved the coloring problem, and Mr. Cabot's ingenuity also added to his discovery of the great merit of preserving the shingles. At that time the preservative value of creosote was very little known except to scientific men, but Mr. Cabot knew it, and used it as a basis for his Creosote Shingle Stains. This gave him a combination that produced soft, transparent and velvety coloring effects that were fully as durable as the best paint; also thorough preservation of the wood by means of the creosote, and at a cost that was only about half that of paint, both for buying and applying. In other words, he cut down the cost one-half, and produced an infinitely more artistic result, and instead of hastening the decay of the shingles, as paint did, it prevented their decay.



The colors and shades in which Cabot's stains are made are infinite, and the artistic qualities of the stained shingle house have so appealed to the architects and owners that shingled houses have become universally popular. In fact, the experience with the shingled house has taught people that they can use shingle stains upon rough siding with splendid effects, and bungalows all over the country show evidence of this development. One of the oldest architects said that in the discovery of shingle stains, Mr. Cabot had made the first improvement in exterior coloring in half a century.

A NEW IDEA.



The R. G. Winter Manufacturing Company, 2104 Vliet street, Milwaukee, Wis., manufacturers of the Sensible hangers and fasteners, are placing on the market, a new catch, called the Sensible Screen Door Catch.

The many good points of this new catch are clearly shown in the accompanying illustrations. These illustrations show the catch reduced just one-half the actual size.

The circulars being sent at this time to architects, contractors and builders state that the Sensible is the catch that catches securely but quietly. It prevents the door from warping, keeps out the flies and reduces the noise of slamming to the minimum. Special attention is called to a small rubber cushion in the catch which prevents the slamming of the door, and to the ease with which this catch can be put on by the carpenter.

Screen Door.

Screen Door.

The R. G. Winter Manufacturing Company exhibited this catch at the Dealers' Hardware Convention in St. Paul recently and it was well received by the many hardware dealers examining it, on account of its simplicity and ease of opening, closing and securely holding the door.

Circulars are being mailed and can be had with prices on request.

IMPORTANT CHANGES IN PASSENGER DEPARTMENT GRAND TRUNK RAILWAY SYSTEM.

On account resignation Geo. W. Vaux, Mr. Harry G. Elliott has been appointed General Passenger Agent at Montreal, and is succeeded in Chicago by Mr. J. D. McDonald as assistant general passenger agent.

Mr. McDonald has a wide acquaintance with the railway and newspaper fraternity, having for many years represented his company at Buffalo as agent in charge of the Niagara Frontier, and for the past eight years as district passenger agent at Toronto, where his territory embraced the Highlands of Ontario resorts, including Muskoka, Lake of Bays, Temagami and the Cobalt region.

Mr. McDonald was secretary of the entertainment committee at Buffalo, when the meeting of the American Association of General Passenger Agents met there prior to opening of the Pan-American Exposition; was one of Geo. T. Bell's aids is looking after the general passenger agents at their Portland, Maine, trip, and also two years ago when they had two special trains to the Canada resorts.

Mr. McDonald's territory embraces what is known as the western division, being that portion of the Grand Trunk Railway System lying west of Detroit and Port Huron, and also all territory west of Chicago to the Pacific Coast and Southwest to the Gulf of Mexico.

With Its Back to the Wind and the upward sloping opening in the back taking the full force of the wind, the Iwan Volcano Revolving Chimney Top makes a sure draft on the chimney.

Mountings can be bought separately and the hood and vane can be made in your shop according to patterns furnished free with all iron mountings. Sizes 6 to 12 inches.

Prices and catalog sent promptly.

FIREPROOF CORTRIGHT METAL SHINGLES

Selling Talk No. 11

4186 Buildings Burned

A recent issue of a publication devoted to insurance interests records 4186 fires which they directly attribute to the use of wood shingle roofs.

In view of these appalling facts why is it that property owners still continue to risk the total loss of building after building by roofing them with wood shingles?

Especially when the remedy is so readily obtainable in Cortright Metal Shingles.

Cortright **are** fireproof and stormproof besides being more handsome and durable than either wood or slate.

Cortrights as a matter of fact will outlast the building itself and flying embers from a neighboring fire such as shown in the picture above can have no effect on a roof of Cortright Metal Shingles.

Will you let us send you the proofs of all this? All we're waiting for is your name. A postal will do.

CORTRIGHT METAL ROOFING COMPANY - - - - PHILADELPHIA AND CHICAGO

MORE HEAT AND LESS FUEL

This shows the Jahant Down-Draft Furnace without the casing, pipes, etc. The air enters the inlet marked "Draft" and rises through the two cast iron smoke-proof pipes that lead to the top of the fire box. Being colder and consequently heavier than the air directly over the fire, it falls and forms a down draft through the center of the fuel until it becomes heated and rises to the service pipes. The Jahant Down-Draft Furnace consumes every piece of fuel to a fine ash and liberates every unit of heat.

$10 Down Send us $10 with plans of the rooms you desire to heat and we will send the proper sized Jahant Down-Draft Furnace with full instructions for installing. You can pay the balance in monthly installments. Write for our big furnace book. It is free.

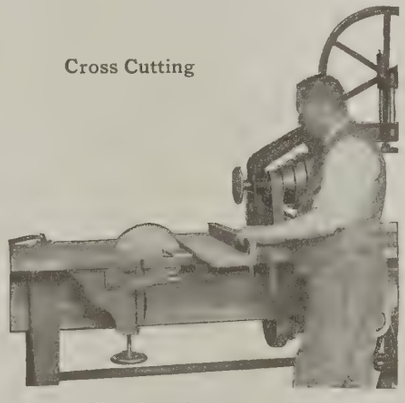
BUFFALO CRAIN COMBINATION WOODWORKER.

The Buffalo Forge Company, Buffalo, N. Y., holds the exclusive rights for manufacturing and marketing the Crain Combination Wood Worker, which is the most recent invention in its field. The machine appears to be thoroughly practical and possesses many features which make it admirable for use in contractor', builders', carpenters' and repair shops.

The principal parts, such as the band saw, rip saw, planer, lathe, etc., are of very ample dimensions and easy to adjust. A highly advantageous feature of this machine is that three men can work independently at it at one time, each one having ample elbow room. The majority of operations common to a woodworking shop can be performed on this machine without any extra attachments, simply by a quick and easy change of a few tools. The power consumption must be considered very low, being only 4-H. P. at full load. This means quite a saving in power, especially if an electric motor is used as is often the case.



Wood Turning

The lathe and boring spindle has taper socket to fit the ordinary taper shank twist drills, and is also threaded so a face plate or a chuck of any kind can be screwed on.

The boring table can be raised or lowered to bring the work to the height desired for boring. The work can be bored at any angle up to 45 degrees. The boring table is provided with clamps to hold the work firmly in any position.

The band saw has a large, well-supported table; the wheels are 27 inches in diameter, and will saw through any thickness up to 12 inches.

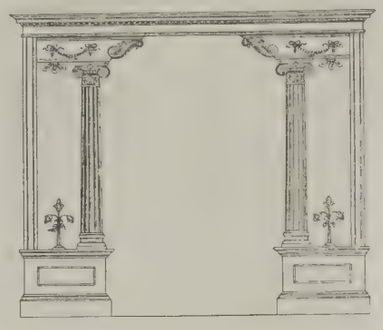
Cross Cutting

The saw arbor will take circular saws 12 inches in diameter. An adjustable cut-off gauge is furnished which can be adjusted to cut to any angle up to 45 degrees.

The planer head is pivoted so that it can be set either horizontally or vertically, or at any angle between, and be used for jointing lumber straight, chamfering or rounding corners, or do work of any irregular shape. It can be used for working mouldings of any kind by making bits of the shape desired. The head furnished with the machine will take bits of different sizes up to 10 inches, and is so made that the bits can be easily and quickly changed. This head is also provided with an adjustable screw by which it can be raised or lowered.

HEATING INFORMATION.

An excellent book on efficient heating of the home has just been published by The Holland Furnace Company of Holland, Michigan This book contains valuable facts, not only on the proper construction of furnaces, but the saving in fuel when the correct methods are used.



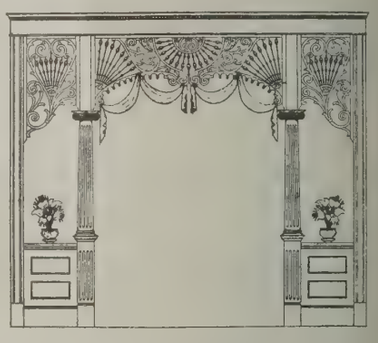
Long experience in the heating business has enabled this concern to secure this practical information and it is put in book form for the benefit of parties interested in furnace heat in houses and homes.

Holland furnaces embody the correct ideas, based on this long experience. They are constructed with double grate surface, patented cored, air-admitting, double firepots, which burn fuel from both sides and top, thereby consuming gas, soot and clinkers with the least smoke.

This book is sent without cost upon request, and as the heating question is an important one to architects, contractors and builders as well as owners, it would be to advantage to obtain a copy. In writing mention THE NATIONAL BUILDER.

GRILLE OPENING AND CONSOL WORK.

Nineteen years in one location, and doing business continuously all that time, is a record that any company can be proud of, and especially so in the manufacture of grilles, openings and consoles. In this line of building material, not only does the workmanship enter into every little piece that goes to make up a grille, but to stand the test of years, only thoroughly seasoned and kiln dried lumber of the better grades and the best glue, etc., can be used.



Way back in 1892, the Chicago Grille Works began the manufacture of grille work at their present location, and have been doing business right there, all of these years, but now on a much larger scale.

The same careful attention to details, the courteous and prompt answers given to every correspondent, and the latest designs and best materials and workmanship has made the Chicago Grill Works thousands of satisfied customers and friends among not only contractors and builders but also among the owners who have these grills in their homes.

Beginning with a few designs, they now offer their customers selections from an attractive, fifty-page catalogue. The different designs are described in such a plain clear way that there can be no misunderstanding in ordering from this catalogue.

Prices are quoted on plain red oak, unselected birch, yellow pine, cypress—not varnished. For woods other than these, prices will be given on request, and prices quoted are for goods crated F. O. B. Chicago.

Years ago one of the best liked pieces of grille work was the Chicago Grille Works No. 55, and the fact that it is still one of the frequently selected designs, speaks well for its beauty and workmanship.

No. 55 has a square post 5¼ inches, columns 5 inches, composition caps; center drop of grille 14 inches; ends drop 36 inches, and the pedestals extend 21 inches from jambs and are 30 inches high.

No. 102, another very popular design, illustrated here, shows a colonial opening which, during the past few years, has had a large sale and has been placed in many beautiful homes. This design is constructed with a special view to electric light wiring. The cut shows electric lights on the pedestals and beam brackets. It is carried in stock for 5½ to 6¼-inch jambs. Either plain or reeded columns can be had for the same price. Pedestal measurements are: Length over all, 26½ inches; height, 20 inches; width, 8 inches; cap, 10 inches; columns, 6 inches; base, 5 inches; neck, composition caps, beam brackets with composition ornament. Length over all, 33 inches; width, 5½ inches; face, 9 inches.

The console design shown here is a new one, and is made with pilasters instead of columns. The pilasters have beautiful composition ornamentations, which also appear on top frieze. The height is 7 feet, 6 inches; width, 4 feet 11 inches, and mirror 40x58 inches. This design is made in oak and birch.

The Chicago Grille Works, 838 Wells street, Chicago, are getting up a new catalogue, which architects, contractors and builders will find a first-class reference in specifying and buying materials from in this line. It can be had by those interested in up-to-date design in the line, reliable materials and good workmanship.

A well designed grille, colonial opening or consol adds not only to the attractiveness of the home, but also to the value of the property, and the new catalogue will aid in making the right selections for the home owner.

The Chicago Grille Works do not stop at the designs shown in their own catalogue, but will be pleased to manufacture anything in the line of grille work shown in any catalogue.

"I have been told," said the confident performer, "that I make my violin sound like the human voice."

"Yes," replied the candid friend, "but there are so many kinds of human voices."—Washington Star.

Amatite ROOFING

Saskatoon Fair Buildings, covered with Amatite Roofing, Saskatchewan, Can.

60,000 Feet of Amatite Roofing

The accompanying view shows a series of buildings at the Saskatoon Exposition, all of them covered with Amatite Roofing.

Amatite was selected because it was inexpensive, easy to put on, required no care or attention or expense afterwards, and would give excellent durability.

If ordinary smooth roofing had been used, these roofs would require painting every year or two at considerable expense and trouble. Amatite, however, has a mineral surface which *requires no painting.*

Amatite is the most economical solution of the roofing problem known.

Amatite Roofing requires no skilled labor to apply; it costs no more (in fact, much less) than most other roofings; and the fact that it requires no painting makes the total expense far below that of any other type of roof covering.

You can use Amatite on every kind of steep roofed building. We supply galvanized nails and liquid cement for the laps free of charge.

Send for sample, booklet and further information. Address our nearest office.

"On The Level" Talk

Talk No. 2—by the Man from Akron

See Those Silver Lines?

They are an exclusive feature of Akron Eclipse Spirit Levels. You'll find them in no other make. Those two little lines show you exact **level** at once. Nothing left to guesswork. No straining the eyes on a cloudy day or in a dark corner to read the level. You can read the Akron instantly even at a considerable distance.

Akron Eclipse Levels

are not only the most accurate and easiest reading levels in the world, but they are the most durable of all. The stock is made of finest laminated hardwood. All spirit tubes are carried on rubber bearings, incased in an outer tube of heaviest steam-gauge glass, which gives great strength and withstands the jars and falls of daily use without the least injury.

All glasses are adjustable, insuring absolute accuracy at all times.

Made in 33 styles and sizes for every purpose; some with two plumbs, some brass bound. You'll find the best level for **your** purpose in the Akron line.

If your dealer doesn't sell Akron Eclipse levels, we'll fill your order direct. Write today for catalog and price-list, mentioning your dealer's name.

NAT BUILDER

Let Us Pay the Postage To You On All Three Free—For a Test

Johnson's Prepared Wax

is a complete finish for all hard and soft wood—equally well adapted for use on floors, woodwork and furniture. May be used on the bare wood or over Dye, Paste Wood Filler or any finish—simply apply with a cloth and bring to a polish with a dry cloth or brush.

Johnson's Prepared Wax gives that beautiful, artistic, dull finish so much in demand. Prepared Wax does not show scratches and heel marks, and work finished with it may be easily kept in perfect condition.

Johnson's Prepared Wax contains a larger percentage of hard, expensive wax than other wax finishes on the market, and for this reason it covers a larger surface and can be brought to a more beautiful and lasting polish. It does not become soft and tacky in warm weather or warm climates—or from the heat of the body.

Ask your Dealer for Free Sample

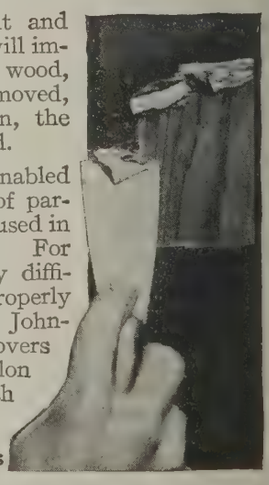
Johnson's Crack Filler

is a paste filler for cracks, crevices and nail holes. Should be applied the same as putty, but it is much superior to that article as it does not chip, crack or come out of place. When Johnson's Crack Filler has hardened it takes Johnson's Wood Dye the same as the wood.

Ask your dealer for free sample of Johnson's Crack Filler and test it out.

Johnson's Paste Wood Filler

is made in five shades for filling the grain of all wood, soft and hard. Manufactured from the best and most expensive silex, linseed oil and the best Japan dryer, and is guaranteed to give satisfaction.



All wood which is to be finished natural should be given a coat of Johnson's Natural Paste Wood Filler No. 10 and a finish-wax, Under-Lac and Wax or Under-Lac and varnish.

We recommend the use of our colored shades of Paste Wood Filler where a golden oak, dark oak and Antwerp finish is desired on hard woods, also for use over Johnson's Wood Dye where a filled grain effect is desired.

Ask your dealer for a free sample of any shade of Johnson's Paste Wood Filler.

Johnson's Electric Solvo

is the best and most efficient paint and varnish remover on the market—it will immediately soften all old finish on wood, glass or metal so it may be easily removed, leaving the surface bare and clean, the same as before any finish was applied.

Through a secret process we are enabled to use a much smaller percentage of paraffine in our Electric Solvo than is used in any other remover on the market. For this reason you will never have any difficulty with the new finish drying properly if the old finish is removed with Johnson's Electric Solvo. Many removers contain enough paraffine in one gallon to prevent many gallons of new finish from drying.

Ask your dealer for free samples

S. C. Johnson & Son, RACINE, WISCONSIN

Wood Finishing Authorities.

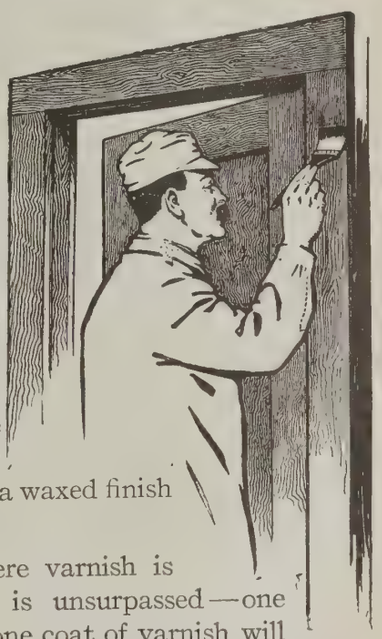
Send Coupon Now for Free Samples of Johnson's Artistic Wood Finishes

EVERY practical contractor and builder can better his work, better his profits and better his reputation by using Johnson's Wood Finishes. You can prove this at our expense—it will cost you nothing—save you much. We want to send you free working samples and Johnson's Illustrated Color Book—"The Proper Treatment for Floors, Woodwork and Furniture"—giving complete directions for their use.

We want every contractor and builder to accept this free offer. Mail coupon or postal today.

Johnson's Wood Dye



is not a mere surface stain—but a deep-seated dye, penetrating the wood and fixing a deep, rich, permanent color entirely different from ordinary stains, which are only "skin deep."

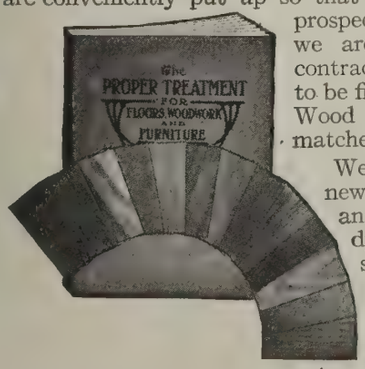
Made in fourteen attractive shades.

When used in combination with Johnson's Prepared Wax or Johnson's Under-Lac, inexpensive soft woods such as pine, fir and cypress, may be made as beautiful and artistic as costly hard woods.

Ask your dealer for free samples and prove it for yourself

Johnson's Under-Lac

A spirit finish vastly superior to shellac and varnish—not thick, sticky and slow drying like varnish, neither does it dry too quickly like shellac. Under-Lac should be used over Johnson's Wood Dye and Paste Wood Filler, where a higher gloss than a waxed finish is desired.



For a first-coater, where varnish is to be used, Under-Lac is unsurpassed—one coat of Under-Lac and one coat of varnish will give a better finish than three coats of varnish without the Under-Lac.

Under-Lac is particularly adapted for finishing linoleum and oil-cloth—dries hard so the floor may be walked on in an hour.

Ask your dealer for free samples and convince yourself of the merit of Johnson's Under-Lac. Gallons $2.50.

Johnson's Color Panels and Illustrated Book

Let us send you free a complete set of wood panels showing all shades of Johnson's Wood Dye on various woods. These panels are conveniently put up so that you can easily show them to prospective customers—by doing so we are sure you will procure many contracts at profitable prices for work to be finished with Johnson's Artistic Wood Finishes. The dye *always* matches the panels.

We will also send you a copy of our new book illustrated in many colors and containing color plates of the dye. This book gives full instructions for finishing and refinishing all wood—soft and hard. It is invaluable. Present the attached coupon to your leading paint dealer for samples, wood panels and book. Or mail coupon to us giving dealers' name and we will send them to you from Racine.

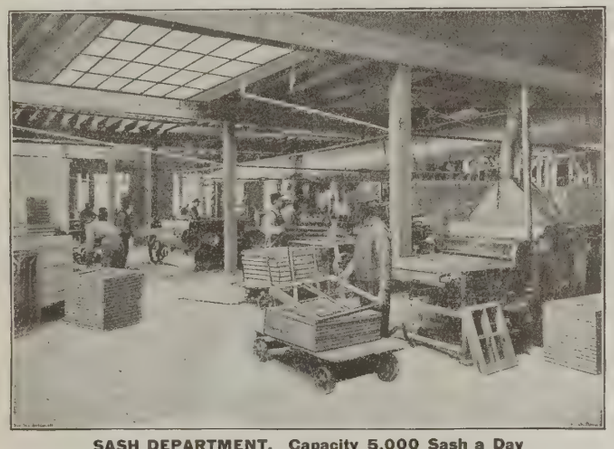
THE WHOLESALE WAY OF BUYING



FROM THE PRODUCER——SAVES YOU 25% ——GIVES YOU LUMBER

We Ship Lumber From This (Our Own) Big Saw Mill Direct To You

THE SEARS, ROEBUCK AND CO'S LUMBER MILLS LOCA

WHERE THE FINEST TIMBER GROWS. PICTURE AN EXAC

SASH DEPARTMENT. Capacity 5,000 Sash a Day

THESE PICTURES SHOW YOU how well prepared we are to fill your orders and why we can make prompt shipment. When goods are selected from our Building Material and Mill Work Catalog we can ship them to you practically on the same day that your order is received.

EXPERIENCED BUILDERS WILL APPRECIATE QUICK SERVICE. We have over seven hundred people engaged at the factory to handle your orders. They will give you not only prompt service but they will pack your materials in such a way as to insure their getting to destination in first class condition.

A CORNER IN DOOR WAREHOUSE.
75,000 Doors In Readiness to Ship on Your Order.

YOUR ORDER WILL BE SHIPPED AT ONCE. No order is too large, and no order is too small for us to handle. We are equipped for handling orders amounting to from $500.00 to $10,000.00 just as promptly as orders amounting to from $5.00 to $10.00. Our shipping facilities are unexcelled anywhere.

WE USE A PLAIN SHIPPING TAG on all our crates and bundles, which makes it impossible for anyone to tell by whom the goods were shipped.

LIVE, WIDE-AWAKE CONTRACTORS WHO HAVE GRASPED THE OPPORTUNITY OF BUYING DIRECT from the producer made it possible for us to build up this, the world's greatest organization of its kind. These contractors have saved profits amounting to thousands of dollars which, before trading with us, went to the dealer in the way of handling expenses and profits. Are you still paying these unnecessary handling expenses and profits and passing up the opportunity of saving thousands of dollars per year?

HERE IS YOUR OPPORTUNITY. From now on you may be independent of the retail dealer or jobber. We will sell you lumber and mill work at manufacturers' prices, prices which will be found even lower than the up-to-date retail dealer pays in many cases.

WITH AN ASSORTMENT OF NEARLY 15,000,000 FEET or 1250 carloads of lumber in readiness to ship, we can fill your order complete for all sizes and dimensions the same day it is placed with our mill. We will guarantee the grades to be strictly southern mill grades.

BUY DIRECT FROM OUR MODERNLY EQUIPPED MILL. We guarantee our lumber to run in exact width and thickness and all tongue and grooved material to be absolutely uniform. This feature is appreciated by the up-to-date contractor. If poorly regraded stock will answer your purpose, why not buy southern mill grades, such as we can offer you, and profit by regrading the lumber yourself? We can save you from $100.00 to $150.00 on a carload of lumber. Why not take advantage of it? We will gladly send you our Wholesale Delivered Lumber Price List quoting prices delivered to your station. Write for it; it is free.

TED IN THE HEART OF THE GREAT TIMBER LANDS

REPRODUCTION OF PHOTOGRAPH TAKEN NOVEMBER, 1910

DO YOU STILL PAY THE LONG RETAIL PRICE FOR DOORS, WINDOWS, BLINDS, MOLDINGS, PORCH WORK and other general mill work? Here s your opportunity to buy mill work direct from the producer. Save the profit you are now paying the retail dealer. Besides giving you the benefit of the lowest wholesale prices, we guarantee to furnish you a better grade. Let us prove this by shipping your next order. We are building up our immense business by furnishing a quality of mill work that is beyond question of even the most critical trade. Quality is the first consideration, prompt delivery second and low prices third. Your money back if you are not satisfied. Write for our free Building Material and Mill Work Catalogue. It will be mailed to any carpenter or contractor free of charge. After receiving this catalogue you will take advantage of the special low wholesale prices we quote. You can't afford to do otherwise. Read what two of our customers say about the big saving we make them. Can you beat it? We have saved thousands of our customers fully as much or more. Let us send you our booklet of letters by contractors who regularly buy from us.

LET US FURNISH YOU ARCHITECTURAL SERVICES FREE OF CHARGE. This offer includes a full set of working drawings, specifications and an itemized bill of material for nearly 100 styles of houses. This service we furnish to our regular contractors without charge. Let us demonstrate how well and cheaply you can build by following our plans and by using our material. Please let us send you our latest Book of Modern Homes which illustrates and describes a full line of houses and bungalows designed by our own architects.

DOOR DEPARTMENT. Capacity, 1,500 Doors a day.

THE FACTORY IS EQUIPPED WITH THE MOST UP-TO-DATE MACHINERY; BEST QUALIFIED MECHANICS ARE EMPLOYED. The mill work is manufactured in quantities ordinarily large enough to supply a hundred good size dealers. This is why we can sell a $1.75 four-panel door at 95 cents, and a 24x28 inch window fully worth $2.00 for only $1.10. Low as these prices unquestionably are, we guarantee the quality.

A Post Card Request Will Bring YOU the Same Opportunity

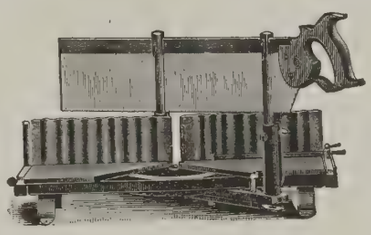
Extension Bit Holder, No. 5

It has been found very difficult to make a strong and adequate bit extension of a dimension so contracted as to follow a 5/8 inch bit into a hole, without either breaking the chuck through its weakness, or losing the bit in the hole being bored. As these extensions are used largely for boring between partitions, such results may be rather disastrous through the loss of the bit in the partition, or marring the grace of the structure into which the hole is bored. The chuck to No. 5 is a little less than 5/8 inch in diameter, so will follow a bit of that size. The four jaws are made in one piece from steel, and are exceedingly strong and so constructed that the square corners of the bit shank will go between them, holding them very rigidly. This extension is durable and capable of performing all that can reasonably be expected of it. The tool is most useful to electricians and plumbers.



Price, in lengths of 12, 15, 18 and 21 inches, each $1.50

Diehl's Separable and Reversible Hinge No. 20

This hinge is designed for storm and screen doors. The door may be swung at right angles and lifted from its bearings without removing the screws, as the shank slides through the small slot in the upper ear so that it makes it very easy to change from storm to screen doors and from screen to storm doors without removing the hinges. Hinge No. 20 is made of open hearth wrought steel, 14 gauge, and finished in black baked japan or oxidized copper.

A Sample Set of Hinges will be sent upon receipt of 25 cents in stamps.

"That Coupon Gave Me MY Start"

"It's only a little while ago that I was just where you are now. My work was unpleasant; my pay was small. I had my mother to take care of, and it was tough sledding trying to make ends meet. I hadn't had much schooling. I didn't *know enough* to fill any better job than the one I had.

"One day I saw an advertisement of the American School. It told how other men got better positions and bigger salaries by taking their courses. I didn't see how a correspondence course could benefit me, but as long as it didn't *cost* anything to mark the coupon I thought it was worth investigating at least. I marked the coupon and sent it in on the next mail.

"That was two years ago last April, and now I'm drawing more every week than I used to get in a month."

If YOU want a better position, if YOU want to get into congenial work, if YOU want a salary that's worth while—

A Wonderful New Ellipsograph and Divider
—called the KELLEY

Draftsmen, Pattern-makers, Mechanics, etc., can now obtain an instrument which will draw an ellipse of any given major or minor axis, just as readily as an ordinary compass will draw a circle. For carpenters, builders and contractors its use is a necessity for saving time and doing perfect work.

Illustration shows the machine and a few of the curves obtainable with the KELLEY Ellipsograph. It is the acme of simplicity in operation and is absolutely reliable in results. It can be adjusted for any ellipse or curve in a few seconds and is readily understood by anyone.

Price Complete $3.00

We positively guarantee satisfaction. Send $3.00 for this unique instrument and we will send one by return and pay charges. It will pay for itself in a saving of time, labor and worry.

STANDARD HANDBOOK OF ESTIMATING DATA

Every man in the building trade needs it.

READ WHAT OTHERS SAY:

It is a very handy book, not only valuable but comprehensive.

I think it the nearest correct, and the shortest cut to business, the busy man has yet found.

It fills a place that has been wanted for years.

Your Standard Handbook is the best book of its kind ever written.

For all the 30 years I have spent in estimating and building I would not be without it for twice the cost.

Just what I want and well worth the money. Thank you for calling my attention to it.

PRICE, ONE DOLLAR

GREYHOUND HAND SAWS

SPEED & EASE
TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. **This saw will be imitated by others—but not equalled.**

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the **best** for your use, you get your money back.

U. S. Standard Cement Mixers and Block Machines

ARE THE STRONGEST, LONGEST AND EASIEST WORKERS ON THE JOB

U. S. Standard Junior Block Machine.

OUR **U. S. Standard** Junior and Senior Block Machines are both built upon the same basic principles, the former building a 16″, the latter a 24″ long block and all fractional lengths thereof. Both of these machines build hollow blocks 6″, 8″, 10″ and 12″ thick and veneer blocks 3″, 4″, 5″ and 6″ thick. The equipment also provides plates for circular blocks, angle blocks of any desired angles, porch pier blocks, chimney blocks, etc. These machines are capable of producing a greater variety of styles and sizes of blocks without additional investment than any other machine made, and for simplicity, speed, completeness, strength and beauty of blocks cannot be equalled.

THE **U. S. Standard** are continuous mixers. The measuring and proportioning of the cement, sand, gravel or crushed stone is done automatically. With the **U. S. Standard** measuring is positive, and does not vary with coarse or fine, wet or dry ingredients.

SPECIAL FEATURES—Accuracy in measuring, correctness in proportioning and thoroughness in mixing the ingredients. All these operations are automatic and absolutely reliable. Detailed information will be furnished upon application for our Catalog No. B.

Ideal Concrete Machinery and the Tycrete Process

Ideal Model 1 Block Machine

The SENSATION of the Cement Shows

Afford You Limitless Opportunity for Profit

The immense crowds that surged up and down the aisles of the New York and Chicago Cement Shows gazed longest and marveled most at the exhibit of **Ideal Machines** and the beautiful Tycrete Concrete stone which these had produced in an almost endless variety of finish and artistic coloring.

Architects, contractors, building supply dealers, leading business men, people who are planning homes of their own, and those who came from mere curiosity—all were amazed at the wonderful development of the industry as embodied in the Ideal exhibit, and awoke to these facts:

First The **Ideal Line of Concrete Machinery** has outdistanced all competing lines—it alone has kept abreast and ahead of the phenomenal development of the concrete industry.

Second: The **Tycrete Process**—the wonderful concentrated Compound and Colors by which dense, indestructible, waterproof Tycrete Blocks and Dimension Stone is produced in a variety of coloring, providing limitless possibilities of artistic expression—is bound to revolutionize this industry.

If you want to make the most money in the concrete business, get Ideal equipment. Send us your address today and let us send you full information about Ideal Concrete machinery and how you can secure this wonderful Tycrete process.

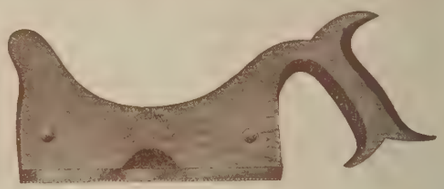
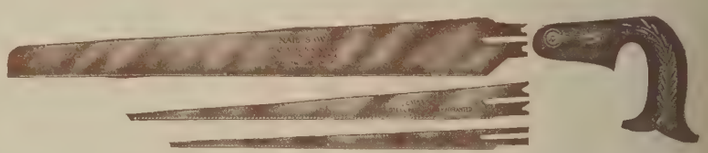
ATKINS SILVER STEEL SAWS



WE HAVE said a great deal about ATKINS SILVER STEEL HAND SAWS. We have told you how they are made and what splendid service they are giving others and what they will do for you. Now, we want to show you a few pictures taken from photographs of the Saws themselves, because we know you will be interested. We can't show you the whole line, for we make hundreds of different kinds of SILVER STEEL SAWS for all purposes.

But look at this Hand Saw. Ain't she a beauty? Is there not something distinctive and individual about it? Look at its graceful lines and the finish and the perfection hardwood handle. Does it not look like a Saw that would give results? This is our No. 53 and it comes in all sizes and points. There are a number of other patterns, styles and finishes, many of which are described in our Saw Sense Book.



Here is one of our finest Back Saws. Does it not look as though it would do the business? The blade is of SILVER STEEL and will, therefore, run a long time without filing the little fine teeth. The back is of heavy stiff steel and clamps the blade like a vise. The handle is of applewood, easy grip pattern. We make several styles of Back and Mitre Saws.

This Stairbuilders' Saw is a mighty handy tool. The blade may be regulated so as to cut any depth, assuring absolute uniformity.

This is one of our most popular styles of Compass Saw. We call it our No. 2. The blade is of SILVER STEEL and is, therefore, very hard and tough, but not brittle and it is difficult to twist these blades out of shape. The handle is of carved and polished applewood.

This is our No. 3 Nest of Saws with Nail Cutting Blade. They are indispensable to every carpenter. The set consists of a Compass and Keyhole blade, together with a hardened steel metal cutting blade, all of which attach to an adjustable handle. The next time you need a Compass or a keyhole Saw, you had better pay a little more for the No. 3 Nest and thus secure the advantages of the Nail Cutting Blade.

Atkins Always Ahead

HOW TO BUY THEM

ATKINS SILVER STEEL SAWS are for sale by most first-class Hardware Dealers, but if your dealer does not sell them regularly, he will be glad to order for you from his wholesale house. If you have any difficulty in getting them in this way, please let us have your dealer's name and we will see that you are taken care of.

OUR FREE OFFER We are still compiling our list of carpenters and if you will send us ten cents to pay postage, we will forward with our compliments, a fine strong nail apron, together with our Saw Sense Book or Carpenter's Catalog, our monthly time book with scale of wages and some mighty interesting information in regard to High Grade Saws. Write to-day and secure this valuable package

AUGER BIT ESSENTIALS

The Sixth Feature which places

RUSSELL JENNINGS BITS

in a class by themselves, is the

CLEARANCES

It is the correctly formed clearances that enable the carpenter having a Russell Jennings bit to bore a smoother hole, bore it easier than with any other bit, and bore it more accurately as to size. The painstaking care put into the formation of clearances is returned a hundred fold to the user of our bits.

Our Standard auger bits and our quick-boring bits are put up in SETS of 32½ quarters, 13 bits, 4-16 to 16-16. A finely finished hardwood tool box or canvas roll is furnished with each set. The boxes are never sold separate from the bits.

OTHER SETS

22½ qrs.	11 bits
20½ qrs.	9 bits
18 qrs.	9 bits
17½ qrs.	7 bits

BISHOPRIC WALL BOARD AND SHEATHING

ANY WEATHER is "Good Building Weather" when you use Bishopric Wall Board as a substitute for lath and plaster. It is cheaper and better and does away with all delays in building. It is nailed to studding dry, ready for immediate application of paper, paint, burlap, or any other kind of decoration.

FOR WALLS AND CEILINGS

Bishopric Wall Board Easily Applied

This substitute for lath and plaster is made of kiln-dried, dressed lath, imbedded in hot Asphalt Mastic, surfaced with sized cardboard and cut at the factory into 4x4 ft. sheets, which are easily and quickly nailed to studding, ready for immediate application of wall paper, paint, burlap, or other decoration.

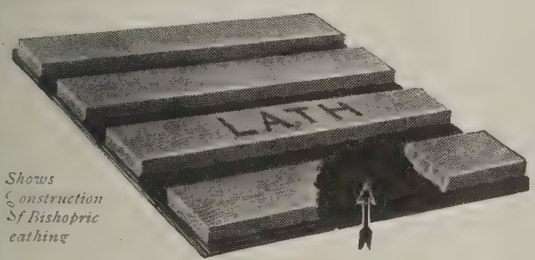
It is applied dry, is guaranteed not to swell, shrink, warp, crack, flake or blister; is clean, sanitary, and odorless; is proof against moisture, cold, heat, and vermin; saves fuel in winter and keeps out summer heat; also deadens sound.

It is suitable for dwellings, factories, new partitions in old buildings, finishing attics, porches, laundries, cellar ceilings, garages, etc.

Applied Dry Winter or Summer

Shows Construction of Bishopric Wall Board.

PRICE WALL BOARD AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6.40 per crate, or $2.50 per 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point.



Cheaper Than Lumber. Saves 75% on Labor. Does away with Building Paper.

BISHOPRIC SHEATHING

Ideal Material for Cement Buildings or Stucco Exteriors. Proof against Dampness.

Bishopric Sheathing is made of same materials as Wall Board, but finish is not necessarily so fine, therefore costs less. It is of uniform thickness, insuring a perfectly even surface when applied.

Bishopric Sheathing is nailed to studs, with lath and asphalt side exposed. Over laths, weather boards are nailed or cement applied.

Shows Construction of Bishopric Sheathing

Arrow points to Asphalt Mastic into which laths are imbedded.

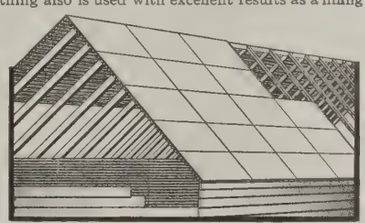
Bishopric Sheathing makes a more solid and substantial wall than lumber. There are no gaping joints; no widening cracks due to shrinkage; no knot holes.

The Asphalt Mastic in Bishopric Sheathing is a non-conductor, moisture cannot penetrate it. It is proof against vermin. The pests cannot bore through the tough, gummy Asphalt Mastic. In applying weather-boards over the laths, dead air space is left between the laths forming splendid insulation. Does away with the expense of building paper and cost of its application.

One Wagon load of Bishopric Sheathing covers an area from six to ten times as great as one load of lumber—a tremendous saving in hauling. Five thousand feet can be hauled in an ordinary wagon.

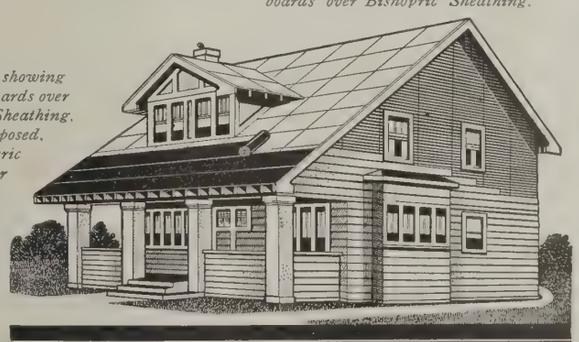
Wall Board and Sheathing are shipped in crates

The cost of applying Bishopric Sheathing is but $2.50 per 1000 feet—A SAVING OF ABOUT 75 PER CENT. Furthermore, 1,000 square feet of wood sheathing covers but 750 feet of surface, 20% less being due to tongue and groove. In Bisnopric Sheathing 1,000 square feet covers 1,000 square feet of space.



In applying ordinary lumber, heavier scaffolding, more tools and greater scaffold floor-space are required In applying Bishopric Sheathing, one man drives a few nails in each sheet; a common laborer or boy can finish the nailing.

Bishopric Sheathing insures comfort during the construction of the building. As soon as the building is closed in with Bishopric Sheathing, the men may work in comfort on the inside during bad weather, finishing the outside on suitable days. This insures continuous work, without loss of time, enabling the contractor to hold his men and complete the work in the least possible time.



Bishopric Sheathing is used with equally splendid results under flooring and as a substitute for roofing boards. Used under floors, it serves as a sound deadener and keeps out dampness; used under the shingles, it keeps out summer heat.

ITS MANY USES—Bishopric Sheathing also is used with excellent results as a lining for dairy barns, ranch houses, poultry houses, driving stables or any out-door building where protection from the elements, Summer or Winter is desired.

Bishopric Sheathing is the ideal material for cement exterior or stucco work. Cement firmly adheres to the laths and Asphalt Mastic and makes a solid, smooth exterior. For factory or residence this form of cement or stucco construction is the cheapest and best known.

Shows Bishopric Sheathing over rafters ready for Bishopric Roofing, also Weather-boards over Bishopric Sheathing.

Ideal home showing Weather-boards over Bishopric Sheathing, lath side exposed, also Bishopric Roofing over Bishopric Sheathing. (smooth side of sheathing exposed)

PRICE SHEATHING AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6, or $2.35 per square of 100 square feet, f. o. b. New Orleans, La., Cincinnati or Alma, Mich. We ship from nearest point.

Write for Descriptive Booklet and Samples of Bishopric Wall Board, Bishopric Sheathing and Bishopric Roofing—All will be sent free.

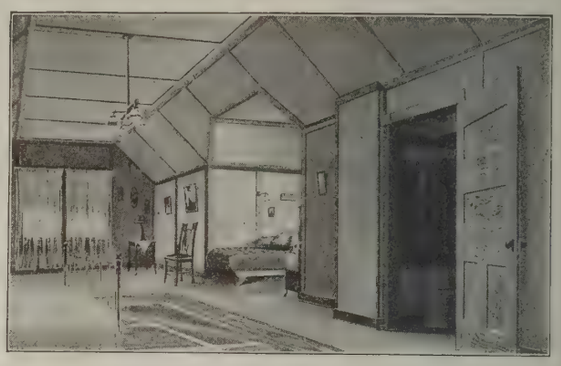
UTILITY WALL BOARD

A Fibrous Water-Proof Board Made in Convenient Widths and Lengths

To be Used Instead of Lath and Plaster in New Building or Repair Work



Make your Garage Warm by Lining with UTILITY Wall Board

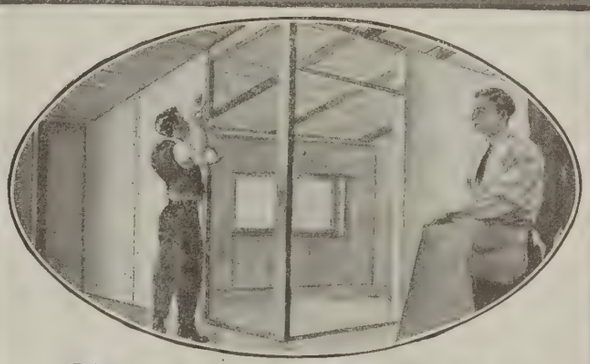
Mr. Contractor

This is your chance to make more money and finish your jobs quicker. UTILITY WALL BOARD is right in quality and price. It has come to stay and is rapidly taking the place of lath and plaster.

Every up-to-date contractor and builder should get samples of UTILITY WALL BOARD at once. There are hundreds of places it can be used with a profit to you and satisfaction to the owner.

Remember that all delays of the plasterer are a thing of the past for those who use this modern building material.

This shows how an Attic looks after being finished with UTILITY Wall Board.



Utility Wall Board is better than lath and plaster. It saves the user a lot of money besides giving him a handsome, durable job. Utility Wall Board can be painted and decorated with the finest results. Utility Wall Board is being used in both small and large buildings. Everyone likes it.

Utility Wall Board can be applied by the carpenter—nailed right to the studs—easy and clean to handle—cuts with a saw—fits any space and can be put on in winter or summer—no waiting for plaster to dry—no cracked walls—no dirt—no ruined decorations—warm in winter and cool in summer

THE HEPPES COMPANY, 4502 Fillmore Street, Chicago, Ill.

Compo-Board

For Walls, Ceilings and Partitions

It is a modern wall lining. Moisture proof, fire resisting, warm in winter and cool in summer.

Better than lath and plaster in every way. More durable—will last as long as the building. Will not crack, crumble or fall off.

Compo-Board can be put on quickly and cleaply in any weather, and can be used in any climate.

Compo-Board is made of strips of thoroughly dried lumber, matched together and well glued. These strips are tnen covered on both sides with a specially prepared moisture proof paper, which is cemented on in intense heat and under heavy pressure.

Comes in strips four feet wide and one to 18 feet long, any length you want in even feet.

Compo-Board can be used in many different ways around the house, in the factory or office, in the cottage at the lake, and in the barn and chicken house.

BOOST YOUR OWN REPUTATION, MR. CONTRACTOR, BY TELLING YOUR CUSTOMERS—"PUT A STOP TO DEPRECIATION—BUILD WITH CYPRESS *AT FIRST*"

IS THE "LIFE-SAVER" of an HONEST CONTRACTOR'S REPUTATION

Here is a letter just received from a builder who **knows** by experience. Probably you feel the same way. Why not **CUT OUT TROUBLE?**

——— — ——— **Contractor and Builder,** — ——— **Street,**

PITTSBURG, PA., Mar. 22, 1911.

Southern Cypress Manufacturers' Association, New Orleans, La.

Gentlemen: Please send me information about Cypress lumber. Have about a dozen frame houses, from two to 16 years old, which I never get through repairing. Window frames, sash, siding, sills, etc., become rotten in a few years, and *the contractor gets a bad name* (as if it was his fault!)

Yours respectfully, ——— ———

This is a bona fide letter—"hot off the bat." The facts are all too true. HE WILL BE A CYPRESS MAN FOREVER. HOW ABOUT **YOU?**

We say it again—that by honest and intelligent advice on **woods** we are not only saving losses to people who are going to **build anyhow**—but we are also

CAUSING MORE PEOPLE TO BUILD

This is going to be of more and more benefit to **you** month by month. It is **up to you** to intelligently take advantage of this by **learning for yourself** that **CYPRESS** is not only the ONE BEST OUT-DOOR WOOD for the owner—but also the ONE BEST WOOD FOR **YOU.** Cypress **"makes good."** That helps your reputation. Cypress is easy to work—that's **good for your tools.**

We are giving away complete working plans and specifications for THIS SHINGLE HOUSE. Many thousands of people ALL OVER THE U. S. are writing for them. THEY WILL HAVE TO GET **YOU** TO DO THE WORK.

THEY WILL INSIST on CYPRESS.

It will be MONEY IN YOUR POCKET TO HELP THEM GET JUST WHAT THEY WANT.

CYPRESS

is the "comer" in YOUR territory.

LISTEN FOR IT

Why not FIND OUT what CYPRESS can do for YOU, NOW? WRITE US—ASK YOUR OWN QUESTIONS—about your own needs, big or little. You can rely on detailed and reliable **CYPRESS** information if you address our "BUILDERS' HELPS DEPT." We will recommend **CYPRESS ONLY FOR USES WHERE IT IS THE BEST WOOD TO USE.**

SOUTHERN CYPRESS MANUFACTURERS' ASSOCIATION

1212 HIBERNIA BANK BUILDING, NEW ORLEANS, LA.

We are *producing* CYPRESS—*and talking it—but not retailing it.* BUY IT NEAR HOME. *ASK your lumber man if he sells CYPRESS; if he does not, ask him WHY. Then WRITE US. We will tell you where you CAN get CYPRESS.*

Genasco

the Trinidad-Lake-Asphalt Roofing

Consider Genasco from the three vital standpoints:

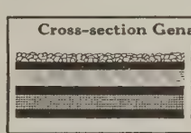
1. **What it *does***
2. **What it *costs***
3. **What it *saves***

1. Genasco waterproofs your roof to last. Trinidad Lake Asphalt, used in making Genasco, is Nature's everlasting waterproofer that has resisted the influences of weather-changes for centuries. It carries into Genasco these same weather-resisting qualities, and makes it defy rain, snow, wind, sun, cold, and heat; and it makes it *permanently* waterproof.

2. Genasco costs about the same in the beginning as the so-called "asphalt composition" or the "special process" roofings which would be wonderfully good imitations of Genasco if they didn't crack, break, and go to pieces. But they can't stand the real test—the weather. They haven't the lasting life which *natural* asphalt gives.

Genasco is economical because it resists and lasts.

3. The saving in Genasco Roofing is plain. You do away with leaky roofs and the expense of repairing them; you prevent costly damage to rooms and furniture, and you save the cost of re-roofing. Genasco first-cost is last-cost.



Get Genasco Roofing—either mineral or smooth surface. Guaranteed, of course.

The Kant-leak Kleet for roofing seams prevents nail-leaks, does away with dauby cement, and gives a fine finish to the roof.
Ask your dealer for Genasco with Kant-leak Kleets packed in the roll. Write us for samples and the Good Roof Guide Book.

Cross-section Genasco Model Roofing

Vulcanite
Standard for 60 Years

Here's a roofing that has passed every test that *proves* good roofing—that has been made and sold on merit for sixty years.

Think of the experience behind it. Consider the number of highest awards it has received at expositions. Study the points that make it so good.

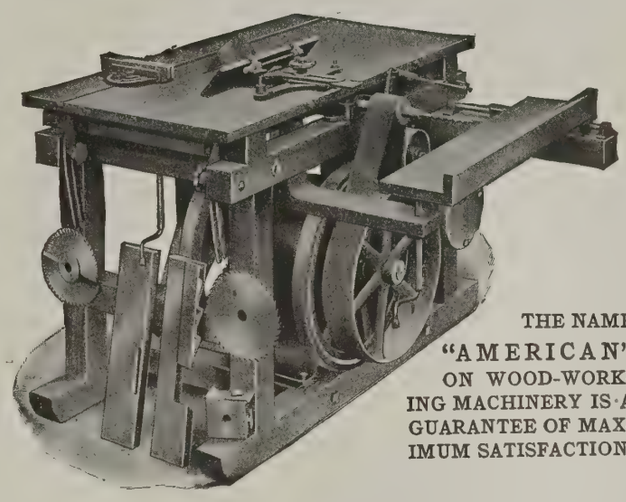
Made from the highest priced mineral compound known and the purest felt obtainable, in our own mills where we can watch the manufacture from start to finish. We use no paper or cheap filler—just the pick of materials that make roofing durable.

VULCANITE roofing will not freeze or crack—climatic conditions have no effect whatever. It's the most extensively used roofing in the world today because—there are reasons.

VULCANITE CRYSTAL SPAR SIDING

A new building material that has made good for use on Bungalows, Summer Cottages, Residences, etc. Fire and water-proof. Easy to apply, never cracks and saves painting and building paper. Used with clap-boards, this siding makes a substantial and well appearing building, besides effecting an all-around economy. Packed in rolls, 40 feet 6 inches long by 32 inches wide.

Send For Samples



To enable the carpenter, builder and contractor to be his own judge and jury of VULCANITE Roofing and VULCANITE Crystal Spar Siding we will send liberal samples free upon request. We merely ask you to examine it—to test them in competition with other brands—and to read our literature. Send today.

THE "AMERICAN" PORTABLE SAW BENCH

WILL PAY FOR ITSELF ON ONE JOB

THE NAME "AMERICAN" ON WOOD-WORKING MACHINERY IS A GUARANTEE OF MAXIMUM SATISFACTION.

Think what it would mean to you to have right on the job an **"AMERICAN"** Portable Saw Bench, which combines the functions of a

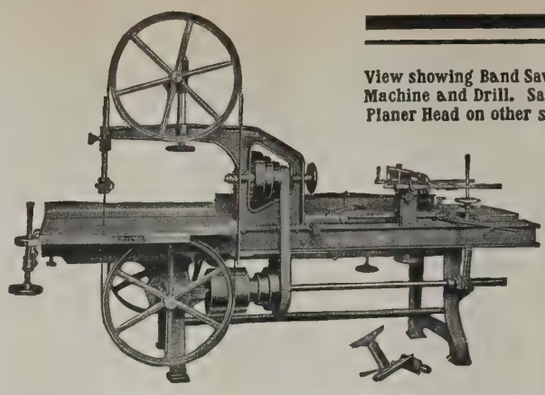
Rip Saw	**Cut-off Saw**	**Mitre Saw**
Dado Machine	**Rabbeting Machine**	**Jointer**
Boring Machine	**Gaining Machine**	**Grooving Machine**
Matcher	**Moulder**	

And all with self-contained power—either gasoline engine or electric motor, as ordered—ready for work at a moment's notice.

If you'll figure the time and labor this machine will save you, you'll understand how **an "American" Portable Saw Bench will pay for itself on one job.** After that, **the money it saves you is clear profit.**

As to capacity, the "AMERICAN" in 1-inch lumber is good for 75 to 125 lineal feet per minute; in 2-inch, 25 to 50 feet per minute. It rips 3-inch stock easily and can be used on 4-inch.

Remember, this is no cheap machine—no make-shift—**but a high-class tool built, like all "American" machines, to do the most work at the least cost and with the fewest possible repairs.**



Write us for a complete descriptive folder.

Built for Service

CONTRACTORS AND BUILDERS ATTENTION

Galloway Engines are made in all sizes from 1¾ to 28 H. P. They run on gasoline, naphtha kerosene or distillate. We are furnishing complete mixing rigs and our price means a big saving of money to you—$50 to $300, depending on the engine you buy. You have the privilege of trying the outfit 30 days. If it is in any way unsatisfactory we refund your money with interest and pay freight both ways.

The Galloway Gasoline Engine

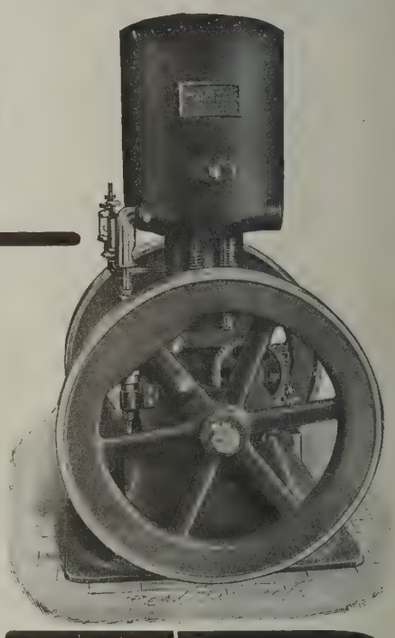
SIMPLEST ENGINE BUILT

Only four things to do:

Turn on the switch, turn on the oil, turn on the gasoline, give the flywheel a start and the Galloway will go right along all day without further attention. It is ideal power for a small shop, and it's got the capacity to take care of your growing needs for operating planers—matchers, lathes, saws and concrete mixers.

The Galloway has been classed as a standard, high grade engine for fifteen years. Over 4,000 in use in Iowa alone. Thousands in every other State and Territory.

If you try the Galloway engine, you will find that it is not overspeeded. Remember, the bore and stroke count, and you don't have to drive your engine faster than you ought to drive it to get the rated horse power. Rated by actual brake test.



On the larger sizes, if it is not entirely convenient for you to pay all cash, we will take your note for the balance at the regular rate of interest for six months.

The price given is for the five-horse power only, but we make these engines in seven sizes.

Ask for free information on stationary and portable gasoline engines from two to twenty-eight horse power. We make the best, and we price them at a reasonable figure. Write today.

The William Galloway Company, 1695 Galloway WATERLOO, IOWA

The NOVO Engine

The NOVO gasoline engine in four sizes from 1¼ to 6 H. P. is especially adapted for use on portable and stationary machinery of every kind. It is **very light in weight, absolutely self-contained,** gasoline being in the base and the water contained in tank around the cylinder, which is guaranteed not to burst from freezing. The **upright form** and **low height** for vertical engine, and **small size of base,** adapts it for use on any machine requiring a self-contained power.

We should be pleased to furnish manufacturers or users of portable machines of any kind with full information, weights, and sizes of our different engines.

We make **three sizes** of **gasoline hoists** for builders' use.

Acme Floor Surfacing, Laying & Finishing Co. Not Inc.

The Boss Improved Floor Scraper

Has double swivel allowing the knife to be set in any position. Gauge can be set for any thickness of shaving and keeps knife from making depressions in floor. Gives knife double support. The pear-shaped wheel which is in the gauge is attached to the gauge in front so that when the scraper is let down to take shaving, it lets the knife down gradually, and prevents the knife from making a deep cut. With this gauge and wheel attachment, the knife will leave no mark. Impossible to do poor work. Adjustment simple—positive. Gauge can be removed instantly. Sanding attachment. Prices very low. Write for descriptive circular.

PROTECT YOUR FINGERS
by using a CRESCENT Jointer with Safety Head

The knives in CRESCENT Safety Heads are made of high speed steel which will hold an edge longer and turn out better finished and more work than can be done on a common jointer with ordinary knives. You may crowd the machine to the limit and the quality of work will be just the same as though you hadn't crowded it a bit.

The price of these splendid machines is very reasonable considering the very high quality of the machines and the enormous amount of accurate work they are capable of turning out.

Send for catalog giving complete description. It tells about our elegant line of Band Saws, Saw Tables, Jointers, Borers, Shapers, Planers, Planer and Matchers, Pole Rounders, Disk Grinders, Variety Woodworkers.

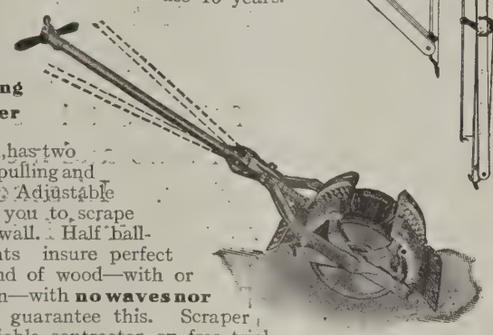
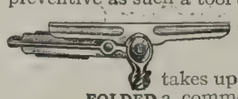
The Latest WEBER Work Savers



SAVE time and you make money. Crude tools delay work and turn out "botch" jobs. My devices are right up to the minute—mechanically correct—and you can't afford to be a day without them. Read every word of this ad; then send for complete catalog and prices. I've been a successful contractor for 25 years, and I absolutely **know** I can save you money at every turn of the road.

Double Scaffold Bracket

is the only one that can be adjusted for use on any kind of buildings. Will not swing sideways and has two scaffold boards which make it ideal for putting up cornices. Weighs only 22 lbs., but is much stronger than the old, heavy scaffolds. Can be folded without loosening a single bolt. When folded, 24 brackets take up space only 3 x 4 x 5 feet. In use 10 years.



WEBER Double-Acting Floor Scraper

improved model, has two knives—one for pulling and one for pushing. Adjustable handle enables you to scrape right up to the wall. Half ball-and-socket joints insure perfect work on any kind of wood—with or against the grain—with **no waves nor chattering.** I guarantee this. Scraper ent to any reliable contractor on free trial.

Folding Saw Vise

holds the saw with rigid unyielding grip and is as nearly noise-preventive as such a tool can be made. Can be thumb-screwed to any plank or bench in an instant. When folded, it takes up no more room than a common hammer. Saves many an aching arm from using dull saws and should be in every kit.

FOLDED

OPEN

Cabinet Scraper and Sander

affords a firm grip and can be controlled with ease in the tightest corners. Knife is fastened with a clamp, not with holes or slots, and can be used till but a half inch remains. Scraper can be quickly reversed and used for sandpapering and polishing. Weight 22 oz. Handiest tool ever made for the purpose.

Sharpening Device

for floor scrapers holds the file at the correct level for an even, true edge on Weber and other floor scraper knives. With this tool, anyone can do excellent work in a short time without previous experience. Well worth investigation.

A TIME AND MONEY SAVER

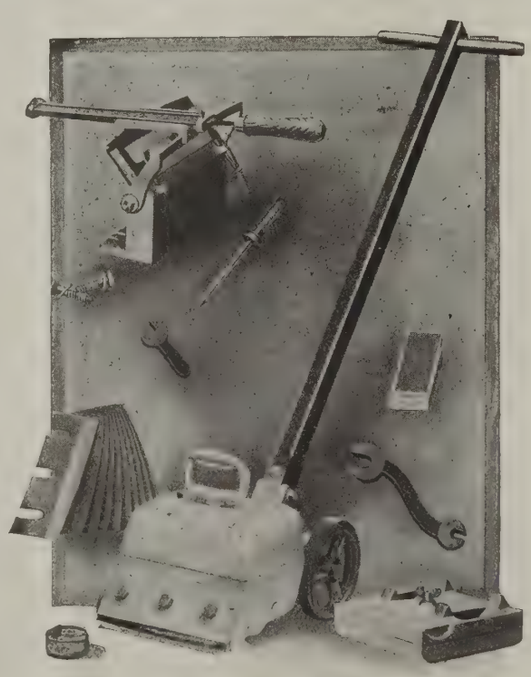
THAT'S WHAT ACTUAL USERS SAY

Read these Recent Letters

Marshalltown, Ia., Mar. 3, 1911.
Jos. Miotke,
Dear Sir:—

One year ago I purchased an Acme Floor Scraping Outfit and in regard to same can say that it has paid for itself many times, besides the hard labor it has saved. To-day I scraped 3½ squares of oak flooring in five hours in a first-class condition.

I have 2,000 sq. ft. of hardwood flooring to scrape at present and wish you would send me another burnisher, also your extra weight attachment.



Trusting you will give this prompt attention, I remain,

Yours truly,
W. E. LANGER

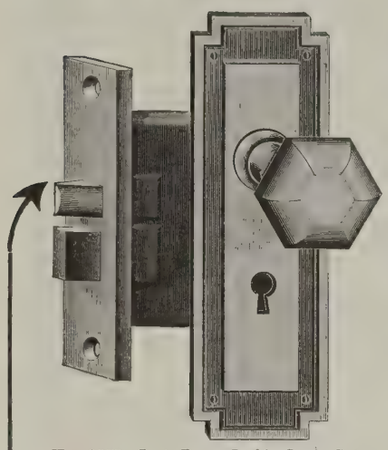
Cincinnati, O., Mar. 1, 1911.
Jos. Miotke,
Dear Sir:—

Send at once by express one doz. blades for the Acme Floor Scraping Outfit which I purchased from you about a year ago. We are well pleased with the machines for we find them to be a great time and money saver, and think it is the best floor scraping equipment on the market.

Yours truly
FITE & FITE.

Read this Free Offer

I will send the ***ACME FLOOR SCRAPING OUTFIT*** to any carpenter or contractor on one week's free trial basis. I will permit the party receiving the outfit to work with the same for a week, and if it does not prove entirely satisfactory the machines are to be returned to me at my expense.



Isn't this a fair offer? Don't you think it is worth your while to investigate? Thousands of carpenters are saving thousands of dollars daily by using the ACME FLOOR SCRAPING OUTFIT, so it's up to you if you want to share in this saving.

The time for you to investigate is now. Drop me a line to-day and get my booklet and full particulars which I will send to you by return mail.

Nicholls' Rafter Framing Rule

FULLY EXPLAINED

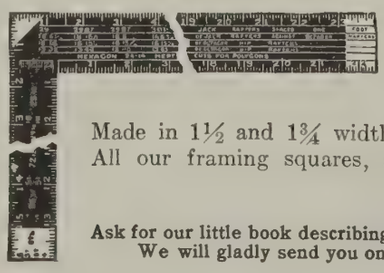
If your roof raises 8 inches to the foot, look under 8 and you will find your figures for length of common rafter, hip or valley rafter per foot run, length of first jack rafter and the difference in the length of others spaced 16 and 2 ft. centers, also their cuts.

FOR EXAMPLE

If your roof raises 8 inches to the foot, or, as it is called, third pitch, under 8 on the first line are the figures 14.42; this is the length of common rafter per one foot run; if the building is 16 feet wide, half the width of building would be the run of common rafter; in this case it would be 8; multiply

14.42 by 8
8

115.36



you have 115.36 inches, or 9 feet 7⅜ inches. To obtain the bottom and top cuts of common rafters, use the figures 12 on body and 8 on tongue; 12 side gives bottom cut; 8 side gives top cut; the same figures give bottom and top cuts for jack.

On the second line under 8 are the figures 18.78; multiply these figures by 8, which is the run of common rafter and gives lengths of hip or valley rafter.

18.78
8

This gives 150.24 or 12 feet 6¼ inches. This is the correct length of hip or valley rafter.

On the fifth line under 8 are the figures 10 and 12; by placing square on stock to be cut at these figures, 10 on body, 12 on tongue, and marking on 12 side, this gives side cut of jacks against hip or valley rafter.

Our No. 100A has the octagon roof framing rule on back of square as per small cut, giving all lengths and cuts of rafters for same. This square sells for **POLISHED STEEL $2.25 OXIDIZED COPPER $2.50 NICKEL PLATED $3.00**

Made in 1½ and 1¾ width tongue. Ask your dealer for these, but if he will not supply you we will prepay express. All our framing squares, also Nos. 100-1-2 and 3 standard squares have **HARDENED CORNERS.**

White portion of cut shows part hardened

Ask for our little book describing our framing rule. We will gladly send you one upon request.

Big Sales—
Big Profits—
And Satisfaction To Your Trade

Plant of B. F. Goodrich Co., Akron, O., covered with J-M Asbestos Roofing

That, Mr. Dealer, is what our tremendous advertising campaign on J-M Asbestos Roofing means to you if you wish to take advantage of it.

In over eighty publications, covering every town in the United States and Canada, and reaching over 27,750,000 readers, we are running strong advertisements giving good, logical, believable reasons why J-M Asbestos Roofing is the best.

In publications reaching the architects, manufacturers, farmers, mine owners, owners of dwellings, etc., all over this entire country, J-M Asbestos Roofing is being powerfully featured. Over 300,000 of these readers are interested in the roofing of big manufacturing plants.

We are telling these people that

J-M ASBESTOS ROOFING

Is the only fireproof ready roofing, the only one that never needs painting, and is not affected by gases, chemical fumes, etc., and many other points which cannot be said of other ready roofings.

Will you couple your name with our fame and let us help you to your share of the profits to be made in your locality?

We will furnish you with handsomely lithographed metal signs, also with beautifully printed booklets, folders, catalogs and samples to give away.

To dealers promising to use them, we will furnish electrotypes of advertisements for use in local papers which will turn the local roofing trade their way.

We will also refer inquiries to dealers who represent us.

And—We don't ask you to carry a large stock, only enough to meet the first demand our advertising creates.

Don't hesitate. Write us for full details of our proposition today.

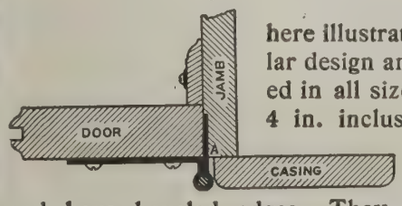
No. 450 —CUT FULL SIZE, 3½ INCH

WE INITIATE—NEVER IMITATE

A Big Hit

Is the new tip with which "NATIONAL" Butts are now equipped, both Common and Ornamental.

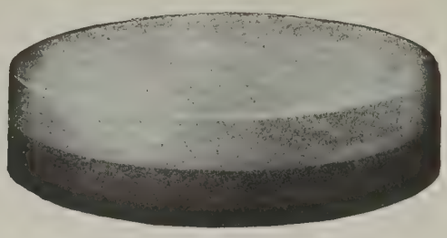


The TIP is threaded and screws into the Butt in both the Japanned and Plated finishes.

It is also SLOTTED for A SCREW DRIVER, making it easy to remove the tip and affords ready access to the pin.

The slot also indicates instantly which is the bottom of the butt—a feature greatly appreciated by the carpenter.

These are exclusive "NATIONAL" features.



Style No. 450

here illustrated is a very popular design and can be furnished in all sizes from 1½ in. to 4 in. inclusive. These butts are highly polished, double plated and have beveled edges. They match escutcheon plates with beveled edges. Ask for "Catalog B" and give dealer's name.

There Is a Decided Satisfaction in Knowing That

Carborundum Sharpening Stones

Are always ready for use—never filled or gummy but always clean, free and fast cutting.
Carborundum is the greatest sharpening agent known. There is nothing harder or sharper.
Its minute crystals are brittle enough to break slightly after a time and turn up new cutting edges—that is why a Carborundum stone never glazes.

The Carborundum Round Combination Bench Stone No. 107 is a wonder-worker.
Just the right shape for that rotary motion required in sharpening chisels and plane bits. Price each, $1.00.
No. 108, oblong shape, in quartered oak box, $1.50.
No. 146, Carborundum Pocket Stone in leather case, 35c.

ASK YOUR DEALER OR SEND DIRECT TO

THE CARBORUNDUM COMPANY, - Niagara Falls, N. Y.

Whatever your customers may demand in

Enamel, Varnish, Stains, Floor Paints and Ready Mixed Paints

"Alcolac" Will Supply

"ALCOLAC" ENAMEL—elastic, hard and smooth—insures a sanitary, porcelain-like finish on wood, iron, stone, tin and other materials.

"ALCOLAC" VARNISH STAINS for finishing and refinishing woodwork and furniture are unequalled. Cover scratches and mars. Produce beautiful finish washable with soap and hot or cold water.

"ALCOLAC" FLOOR PAINT protects as well as covers. Dries hard and resists moisture. A most inexperienced person can apply it.

"ALCOLAC" READY MIXED PAINTS are made of pure chemicals thruout—Linseed oil, Japan driers, lead carbonate, zinc oxide and pure tinting colors. Finishes with a hard glossy surface proof against gases, sea fogs, salt air and atmospheric changes—the enemies of all ordinary paints.

Our discounts are liberal—your profits good.

$150.00 Cash For the 41 Best Answers

WE want to know *what you think*— in your own words —just as you would talk to a man or woman about a job

We say — Johnson's Wood Dye is the best wood dye to be bought —it's the easiest to use.

We claim Johnson's Under-Lac to be far superior to any kind of varnish or shellac.

Now what we want to do is this—we want to furnish *you*—the man who knows a whole lot about woodwork and finishing—some of our Wood Dye and some of our Under-Lac to try out yourself and we want you to tell us in your own words—we don't care anything about fine writing—just *why you would recommend it.* To the 41 painters who send us the best reasons—in not over 150 words for using Johnson's Wood Dye and Johnson's Under-Lac to finish or refinish woodwork, floors or furniture, we will send our checks for one hundred and fifty dollars ($150.00) cash in the following amounts:

Best answer $25.00, next 5 best answers $10.00 each. Next 10 best answers $5.00 each, next 25 best answers $1.00 each, making a total of $150.00 for the 41 best answers.

Here's a chance to make a good Cash profit in less than one hour's time.

Take the coupon printed below to your paint dealer and get from him—without charge—no obligations of any kind—samples of Johnson's Wood Dye and Under-Lac to make a thorough test on some piece of woodwork or furniture.

Johnson's Wood Dye

is not a mere stain. It is a genuine, deep-seated dye that penetrates the wood, giving a rich, permanent color that will not raise the grain in the slightest. We make Johnson's Wood Dye in fourteen standard shades. These are the shades and stock numbers.

No. 126 Light Oak	*No. 128 Light Mahogany*	*No. 121 Moss Green*
No. 123 Dark Oak	*No. 129 Dark Mahogany*	*No. 122 Forest Green*
No. 125 Mission Oak	*No. 130 Weathered Oak*	*No. 172 Flemish Oak*
No. 140 Manila Oak	*No. 131 Brown Weathered Oak*	*No. 178 Brown Flemish Oak*
No. 110 Bog Oak	*No. 132 Green Weathered Oak*	

Half Gallons—$1.50 Each

Johnson's Under-Lac

is a spirit varnish. It will not chip, mar or scratch. Better than any kind of shellac or varnish. Can be easily applied, does not raise the grain, is not thick and sticky like varnish and *dries in half an hour.* Gallons $2.50.

You try these goods. It will take you not more than half an hour spare time. Then give us your personal opinion. Write down your reasons. All you need do is to jot down, in pencil, if you like—Reason 1, Reason 2, Reason 3, and so on.

The 41 painters who give us the best reasons in not over 150 words—for using Johnson's Wood Dye and Johnson's Under-Lac for finishing and re-finishing woodwork, floors and furniture will receive our checks for a total of one hundred and fifty dollars ($150.00). *Do this today. Get the Wood Dye and Under-Lac at your dealer's* **FREE**—*no charge or obligation to you.*

Your answer giving reasons must be mailed to us not later than June 1st. Checks for $150.00 will be mailed June 15, 1911. Don't pass up this chance to make some extra money. A *nice contract* couldn't be better, for this is *clear profit and short work.*

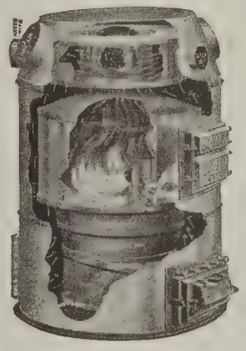
We will save you first cost and lasting economy and reduce your fuel bills ⅓ to ⅔. Find out about the experience of thousands of satisfied owners of Hollands—Double Grate Surface—Patented Corbel Air-admitting Double Firepot, burning fuel from sides and top, nature's way, for greatest even heat. Consumes gas, soot and clinkers with least smoke. No explosions. Book tells all improved tested points, convenience and satisfaction of the Holland. Unlike others. Less joints. No bolts. Simpler and easier and cleaner to run. Ideal damper arrangement. Consumes less fuel. Gives longest service from construction and double materials used where strains are greatest. Save money with

Holland Gas and Soot Consuming Furnace

FREE

Years of experience in the heating business has taught us that the strain in any furnace is from the fire line up and that is why the combustion chamber of the Holland Furnace is over an inch thick at the top where our patented radiator is placed. Radiator is cast in one piece and altogether from the base to the top, our furnace has but five joints.

Burns any fuel—soft coal—slack screens—hard coal, lignite, or wood with least waste. Smoke travels twice as far, no heat wasted. Equal heat all through the house in all pipes. Special Double Guarantee. Book has many other points to tell you.



Save ½ to ⅔ on Fuel

Our fuel-saving claims for the Holland have been proven by thousands of satisfied owners. You be the judge. Just send name on postal for our Big Catalog—Free with other Home Heating Booklets and prices. Who's your dealer?

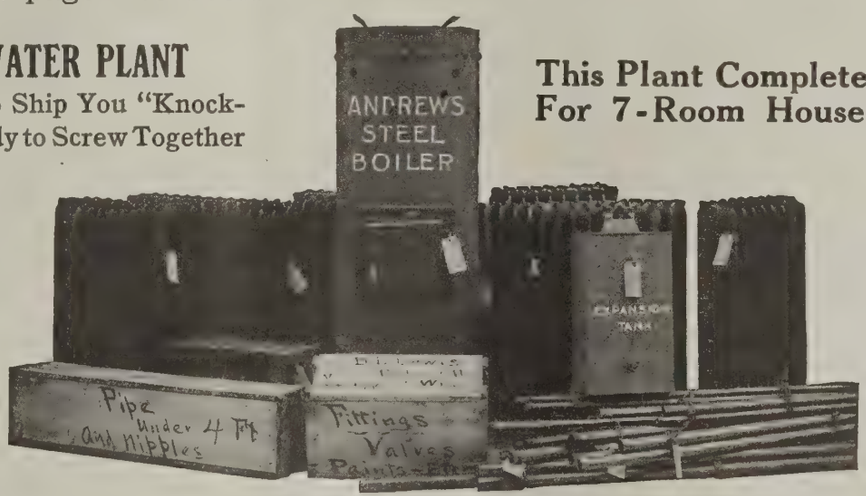
Mr. Contractor:

Here's My Heating Idea that Will Make Money for You

MY plan is the simplest for you to make money on. It eliminates all preparatory work on your part, as I do this for you. It takes the risk of the plant's success off your hands, as I take the responsibility in my guaranty bond. It enables you to make both a good commission and profit on the erection.



My plants are made, complete, in my factory and sent "knock down," freight prepaid, all ready to screw together. My steel boiler is much more economical of fuel, heats quicker, easier to clean and more durable. My regurgitating safety valve increases the heating power of piping and radiators. The directions with each plant are so complete and yet so simple that any carpenter's helper can easily do the work.

You cannot afford to delay learning all about my plan. It is making money for other contractors and can be for you. Write today for my special 1911 proposition, and big new 72 page free book.

MY HOT WATER PLANT

Packed Ready to Ship You "Knock-Down"—All Ready to Screw Together

This Plant Complete For 7-Room House $239.00

Buy Direct And Take The Middleman's Profit

360 Days FREE TRIAL Guaranteed By Bond

We Do the Work of Designing and Make The Plant Fit Your Job—For Old or New Houses

You have nothing to do so far as fitting and cutting pipe or designing the layout of the plant. Our engineers do this work accurately—and furnish such complete and simple directions that any carpenter's helper or handy man can easily set the plant up as good as an experienced plumber. We figure out the size boiler, radiators and piping necessary for most efficient service, cut all pipe to fit and thread it ready to screw together.

Free Estimate

Just send us architect's plans or a rough diagram of each floor of the house to be heated—show size of rooms, windows, height of ceilings and construction of house and our engineers will furnish a free estimate of the complete job delivered at your station. No work for you and no obligation if you don't get the order.

What The Complete Plant Consists Of

Boiler, Piping, Fittings, Radiators, Expansion Tank, Regurgitating Safety Valve, Packing, Bronze and Brushes—everything that is necessary to make a plant the best and most satisfactory. With the plant is sent complete and easily understood plans and directions for erecting so that any one handy with tools can set up an average plant in one-half the time usually required the old way and do just as good a job as a skilled mechanic.

Big 72 Page Heating Book FREE

Our new 72 page book is just off the press. It is complete in its information about our systems, beautifully illustrated and should be in the hands of every contractor or prospective buyer of a heating plant. It shows our 360 Day Free Trial Guaranty Bond, lists thousands of users and describes also our other systems of Plumbing, Air-Pressure Water Supply and Sewage Disposal. Write for it today and send diagrams for free estimate at same time if you can. When writing also ask for our new 1911 Agent's Proposition.

11 TOOLS IN ONE

6 Months Free Trial

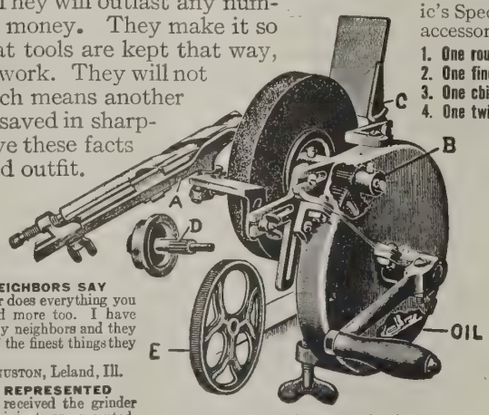
Special Offer on Shop and Factory Outfit

We want every carpenter, every shop, factory, contractor and tool-user to try this grinding, buffing and polishing outfit for six months free—a whole half year for you to find out how this perfected genuine Carborundum grinder saves tools, saves time, and earns money for any shop, factory, or individual tool-user. We want you to prove these facts on your own tools. The whole half year's use will cost you nothing. Try it free for 6 months is what we ask and prove it is a big money-maker for you. Then send it back, if you wish—no hard feelings if you do. Send back the coupon at the bottom of this page for our 6 months' free trial offer.

LUTHER DIAMOND TOOL GRINDER

25 Times Faster than the Grindstone
6 Times Faster than Emery Wheels

The wheels on this grinder are genuine Carborundum. Nothing is so hard as Carborundum except the genuine diamond. Wheels actually made of genuine diamond would cut no faster. In reality Carborundum crystals are artificial diamonds, made by fusing the elements of real diamonds in the electric furnaces at Niagara Falls, in which fire brick melts and runs like butter. In this *utmost* heat, Carborundum crystals get a temper and sharpness that cuts hardest steel or toughest malleable iron as emery does copper. Carborundum wheels do not glaze—they peel steel away in tiny shavings at lightest touch—no hard pressure necessary, no frictional heat, no water cooling necessary, no danger of drawing temper. Genuine Carborundum wheels do not get soft in spots, wear lopsided, or glaze. They will outlast any number of emery wheels, saving that much money. They make it so easy to keep tools keen and bright, that tools are kept that way, and that means more, faster and easier work. They will not draw temper and tools last longer, which means another saving—to say nothing about the time saved in sharpening. But don't take our word—prove these facts by a half year's free use of this splendid outfit.



11 TOOLS IN ONE

This special offer on our shop and factory grinding, buffing and polishing outfit is a remarkable value—the greatest reasonably priced grinder offer ever made. This outfit, on which we will make a 6 months' free trial offer, consists of one Mechanic's Special Luther Diamond Tool Grinder with the following accessories:

1. One rough genuine Carborundum wheel
2. One fine genuine Carborundum wheel
3. One chisel grinding attachment
4. One twist drill attachment
5. One polishing spindle
6. One buffer
7. One polisher
8. One oil stone
9. One Carborundum hone in leather case
10. One Carborundum scythe stone
11. One foot power attachment

This outfit supplies every grinding, buffing and polishing need. The chisel and twist drill attachments make it easy for inexperienced persons to sharpen drills and chisels correctly.

A. Twist drill attachment to give drills proper angle and clearance.
B. Bronze Bearings
C. Chisel sharpening attachment
D. Spur cut from solid steel
E. Large spur machine-cut oil bath

Built Like a High Grade Lathe

The Luther Mechanic's Special, forming the basis of this Special shop and factory outfit, is built for a life-time of service—has steel and malleable construction, dust-proof, bronze bearings, machine cut spur gears, bearings run in oil bath—speed 2,500 revolutions per minute. Carborundum wheels guaranteed 5 years.

Read what others say

Elmwood Haynes, of the Haynes Automobile Co., says; "I have found your machine a very satisfactory device."

MOST PRACTICAL GRINDER MADE

I received the Carborundum Grinder and am highly satisfied with it. I consider it the best and most practical all-purpose machine so far manufactured.

ALLEN STOODLEY, Goldfield, Nevada.

THE BEST GRINDER

I am well pleased with your grinder. It is the best grinder we have around here.

E. N. EARLES, Beallsville, Ohio.

WHAT NEIGHBORS SAY

Your grinder does everything you claim for it and more too. I have shown it to my neighbors and they say it is one of the finest things they ever saw.

LEW KNUSTON, Leland, Ill.

JUST AS REPRESENTED

I have just received the grinder and find that it is just as represented. I am very well pleased with it.

C. H. THOMPSON, Cheyenne, Wyo.

Return this Coupon for 6 Months Free Trial Offer on Special Shop and Factory Outfit

By returning this coupon you will not put yourself under any obligation whatever. We will send you full details of our Six Months' Free Trial Offer, and full description of this splendid grinding, buffing and polishing outfit, also the reprint from McClure's Magazine telling the interesting story of the discovery of Carborundum. Everything we send is free, and puts you under no obligation. If you want to increase shop production, save time, or make your work easier, let us tell you all about this grinder. Send back the coupon today.

Vol. 52 CHICAGO, APRIL, 1911 No. 4

THE NORTHWIN ROUGHCAST HOUSE, for T. G. Windes, Jr., Winnetka, Ill.

NATIONAL BUILDER DESIGN No. 340

Alfred F. Pashley, Architect, Chicago

For Floor Plans, Elevations and Details, See Supplement of this Number. Estimated, Cost $41,24.00

THE NORTHWIN ROUGH CAST HOUSE

The house shown on our supplement sheet for April is a pleasing example of Colonial design, built at Winnetka, Ill., Alfred F. Pashley, architect, of Chicago.

In the basement, space is provided for a Furnace Room, Laundry, Workshop, and Stores. On the first floor a spacious Living Room has a fireplace at one end, on both sides of which are bookcases built in. Opening off the Living Room and well within range of the fireplace is a Den, secure in its isolation for rest, study and quiet. Across the central Entrance Hall are the Dining Room and Kitchen, the latter in particularly good arrangement with the Pantry and rear entrance. Three Bed Rooms and a Sewing Room, each with a separate closet, and a Bath Room, completes the second floor. The attic is devoted to storage room, although there is ample space for additional rooms.

The foundation is brick and the superstructure of frame with rough cast above the grade. When properly applied, this material is durable and adds greatly to the warmth of the house, while its appearance is pleasing. From its location in the suburbs, away from the dust and smoke of the city, the brightness and freshness of the finish should remain a long time, while the incombustible sides reduces the fire risk. The upper sash of the windows is divided into narrow vertical panes. Stained shingles on the hip roof, relieved by dormers, will harmonize with the soft tone of the walls.

QUALITY OF BRICKS

THREE main points with reference to bricks have to be taken into account. 1. The power of resistance under pressure; 2, the appearance of the fracture, which should present an even texture, and a fine and brilliant grain, without cavities in the interior, and neither ribbony nor stony; 3, the exterior, which should be smooth and regular, the angles and edges sharp and straight. When the size of the bricks is equal throughout the mass it is a proof that the brick earth has been well prepared and the bricks generally well made. A brick, when struck, should give forth a clear, ringing sound. Good bricks are generally of a dark reddish-brown color, and sometimes they show vitrified spots on the surface; it is not well, however, to depend too much on this last fact, for it is often only an indication of the amount of heat to which the brick has been subjected, while the clay of which the brick is made may be impure and ill prepared. Bad bricks are readily recognized by their reddish-yellow color, but still more by the dull sound which they emit when struck; their grain being soft they crumble easily, and absorb water with avidity. A good brick should not absorb more than about one-fifteenth of its own weight of water; it should appear, and in reality be, dry. A brick that does not take up any water at all is too much burnt; the mortar adheres to it imperfectly, but it is a good conductor of heat. Such bricks may be used in damp soil and for pavements. When a brick left in water either scales or swells it is of bad quality and contains caustic lime. A brick which, being made red-hot, and then having water poured on it, does not crack, is of extraordinary and rare quality, and those which have borne the effect of moisture and dryness during two or three winters without scaling or cracking are excellent. In order to try if bricks will bear the effect of frost, let one be boiled for half an hour in a solution of sulphate of soda, saturated cold, and then suspended by a string over the vessel in which it has been boiled. In twenty-four hours the surface of the brick will be covered with small crystals; the brick is then to be immersed again in the solution until the crystals disappear, and again suspended, repeating this operation for five days, the crystals reforming after each immersion. If after this treatment a number of particles of the brick are found at the bottom of the vessel containing the solution, the bricks are incapable of supporting the effects of frost.

A COLOSSAL STATUE

WHAT may become one of the most famous statues in the world stands above Eagle's Nest, across the river from Oregon, Ill. It has been in process of making three years and is now near completion. It is constructed of concrete. The Indian figure, which is forty-eight feet high, stands facing the south, looking down the river. The head and profile and folded arms appear perfect in detail as they are outlined against the sky and forest from many viewpoints around the country.

The claim of the statue to fame lies in three things: First, any one may read its message. Second, the statue's great size, forty-eight feet, without counting either the artificial base or the natural rock foundation 250 feet high on which it is placed, puts it on a scale with the Goddess of Liberty in New York harbor and the great statue of "The Pilgrim" on the New England coast.

Brick is still king!

* * *

Late statistics inform us that more money was spent in 1910 for bricks, than was spent for all other building materials put together during the same year.

* * *

A material that holds its own for from five, to then thousand years, without being discarded, is not to be despised, particularly when it is used in larger quantities today than ever before. Will steel, Portland cement, or other material, excepting stone, hold as prominent a place in the building world, after another thousand years have come and gone?

* * *

A brick is a simple thing, and has been known as a "brick only." from time immemorial—it is a good thing, and when a man is dubbed a "brick," we all know the expression is intended to convey the idea that he is a "good fellow." Now, if it had been said, the fellow was a "clay product," you would not have understood what was intended; it would have reminded one of the colored man, who was told to pick up "that agricultural implement"—meaning a spade! The gentleman of African descent, was bewildered—and no wonder, for the term was new and unknown to him. Let us stick to the good old fashion "brick." It is the better word—more appropriate, than the new fangled "clay-product," and homelike. How many men—good men too—who handle brick often, and are regularly employed in the building trades, such as painters, plumbers, plasterers, carpenters and others, who cannot tell the exact size of a brick? Thousands of men who are working, and who have worked among bricks and brick buildings, for years, cannot tell you the standard size of a brick offhand when asked. Every tradesman in building construction, should know the exact dimensions of a brick, and give them immediately on being asked; can you tell at once?

* * *

A change in the style of interior finish is generally, and surely taking place. The change is tending towards a betterment of taste and chaste simplicity. The standards aimed at, which seem to be the objective points are those created by Chippendale, Hepplewhite, Shereton and other Georgian and colonial designers. We have in our mind a very handsome old colonial house, in New England, the home of a dear, wealthy, middle aged lady, who has lately renovated the building, leaving the outside as nearly as possible, as when first built, but the whole interior, with the exception of the hall and stairway, have been so changed that very little of the finishings as first put in, are in evidence. The drawing room and parlor are finished in strict Chippendale style, the furniture being all made of Spanish mahogany in the building, by the workmen who made the repairs and changes, all under the supervision of a competent Boston architect. The hall, as far as possible, and a large open reception room to the right, are finished in the style of Hepplewhite, and are really beyond reproach, both as to proportion and harmony, and in color and balance. But the beauty room, from the standpoint of the writer, is the dining room, which is to the rear of the drawing-room, and is fitted up in a solid Shereton style, the lambrequins, over-mantels and overdoors, are all richly moulded with fine colonial mouldings—all hand made, and, as one lady exclaimed, when she was introduced into the room, "Oh, my! it is an exquisite dream from fairy land!" The whole house—inside and out—is a combination of beauty, good taste and convenience.

* * *

We hope this new departure in domestic architecture will continue, and seize on the artistic good sense of the people. It will prove elevating in the extreme, and will tend greatly towards the cultivation of a broader refinement in matters of home building.

The various cabinet-makers throughout the country are certainly doing their share towards fostering a better taste in the way of artistic furniture and fittings, for much of the work now being placed on the market, is being built on the lines of the Georgian, or colonial practice, and much of the furniture made fifteen or twenty years ago, is finding its way into the upper attic or to the secondhand shops. THE NATIONAL BUILDER will not lag behind in this new movement, but will from time to time publish such items, and illustrate such designs as may be thought to be useful to those who are called upon to work on the lines suggested in the foregoing.

* * *

By the death of John Mervin Carrère F. A. I. A., of the firm of Carrère & Hastings, America, has lost another of her best architectural exponents, and a man who had endeared himself to every person who came in contact with him, either professionally or socially. Since the violent death of the late Stanford White, Mr. Carrère has been much in evidence, in artistic circles. It is rather strange that two of our greatest artists should be taken from us at an eardy age, and by untimely deaths. Mr. Carrère was thrown from a taxicab, which collided with a street car on Madison avenue, New York City, on Feb. 12th, 1911, striking his head on the pavement and rendering him unconscious—from which he never recovered. He died in the Presbyterian Hospital, New York, on March 1st—regretted by all who knew him personally.

* * *

The report of the progress of the work at Panama during December shows that during the month there was completed 1,488,880 cubic yards of excavation for plant, a total for the month of 2,603,206 cubic yards. As compared with the preceding month, there was an increase of 5,060 cubic yards in the amount of concrete laid, the daily average for the 26 working days being 2,085 cubic yards.

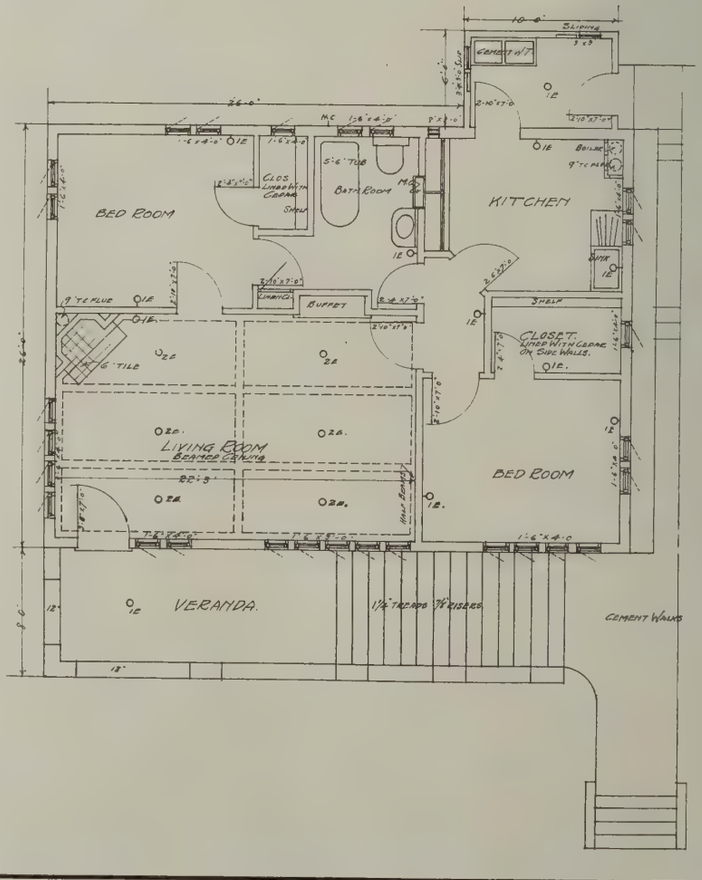
* * *

We note that, by a very large majority, the House has chosen San Francisco as the exposition city to celebrate the completion of the Panama canal in 1915. Although we consider that these great fairs have been too frequent in the past few years, and have been dominated too much by the spirit of commercialism, we congratulate San Francisco on its selection, and express the hope that the authorities will make the event what is should be—a great educational influence.

CEMENT STUCCO COTTAGE

THIS house designed and built by D. E. Wiseman, San Francisco, Cal., is one of exceptional beauty. It is built on a slope overlooking the Pacific Ocean. The exterior is pure white cement stucco, the casements and other exterior wood trim being stained a dark brown to give contrast to the whole. The roof is flat with eaves widely extending.

The steps leading from the side is a good arrangement, as it prevents a glaring appearance which would result if led directly from the front up to the main entrance.



The space from the ground up to the first floor gives ample basement room, although no rooms are finished therein.

The veranda is commodious, being about 7 ft. x 17 ft., partially roofed and with one side closed with glass to prevent the direct draft of ocean breezes.

All windows are long and narrow and of the casement type, opening outwardly.

The floor plan shows a design for home comfort exclusively. All rooms are large and well lighted. The living room has a beam ceiling and a large fireplace across one corner. The closets are lined with cedar to make them moth-proof.

The approximate cost of this cottage is $2,500

"In one benighted region of a certain state in the Southwest," says a Chicago lawyer, "they cherish some peculiar notions touching the duties of a juror.

"One day a case was being tried, when suddenly the justice exclaimed:

" 'How is this? There are only eleven jurymen in the box. Where is the twelfth?'

"The foreman rose and addressed the court respectfully as follows:

" 'May it please your honor, the twelfth juror had to go away on important business, but he has left his verdict with me.' "—Case and Comment.

BUILDING WITH TERRA COTTA HOLLOW TILE

By WM. J. TEAGUE

TERRA cotta hollow tile has been used as a building material in the larger cities for several years, and as a fire-proof material it has proved itself so superior that its use is rapidly spreading. Many tiles are now being used in smaller towns, and even country places, where local builders are not familiar with handling them.

Any competent bricklayer can lay tile, but when building a complete structure many problems present themselves that do not occur in brickwork. The tile used for the walls are scored with dovetailed groves about 3-16 inch deep. Those used for floors are marked with shallow groves which make them better for plastering against.

When starting to build with them it will be found that the tile vary in thickness and height, while some are winding or otherwise distorted. This is disturbing to some bricklayers, but if care is used by the corner men to select the straight tile the walls can be kept straight; the variation in the height of a course can be partly overcome in the next course, and while the important thing is to have face of wall straight, it is better if each course is kept somewhat in level.

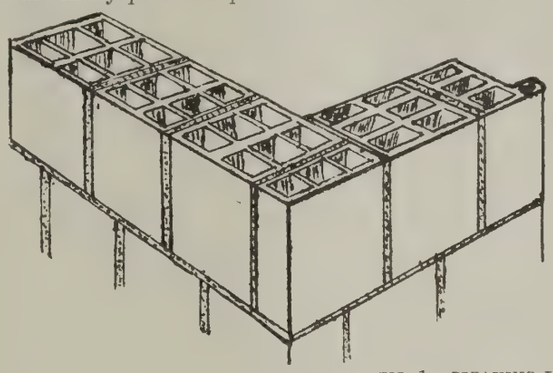


FIG. 1. BREAKING JOINTS IN 12-IN. WALL.

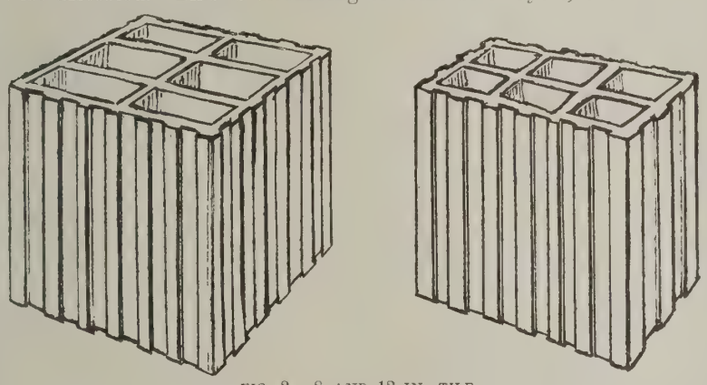

FIG. 2. 8 AND 12-IN. TILE.

The easiest and most natural way to lay tile would seem to be on the side with the holes horizontal, but in practice, the easiest and best way is on end with the holes vertical. In the first place the walls are much stronger when the tile are laid on end, the ends also, are straight, while the sides are a little full, making it almost impossible to use some of them on the side. The tile do not absorb the moisture from the mortar so readily when laid on the side, which avoids a great inconvenience when it is necessary to run to story height.

The only mortar that can be used is cement mortar. This must be made rich enough to be a little sticky—about 2½ of sand to 1 of cement, with the addition of a little lime if thought best.

The spreading of mortar on the narrow walls and partitions of the tile is one of the first difficulties that presents itself. To do this without losing a quantity, takes a little practice, but it is only necessary to spread mortar on the edges that run in line with wall and not the cross partitions, which seldom coincide with those above or below. The upright joint is put on the tile to be laid, and by resting it on the mortar board the mortar that falls off can be saved.

For 10 and 12 inch walls there are made corner blocks 15 inches long, for the purpose of breaking joints. Sometimes these are not provided, it is then best to start corners with a 6 inch tile on each course, as illustrated in Fig. 1. This will save breaking tile.

The 12 inch tile contain six holes as illustrated in Fig 2. The right way to lay them is with the three holes across the wall. In this way your wall will have four partitions of the tile as bearing walls with a corresponding increase in strength, and if an 8 or 6 inch tile is used as a closure, the partitions will be above the partitions in the 12 inch wall.

Piers are often built of tile and filled with reinforced concrete. When building for this purpose after every two or three courses, the inside mortar joints should be cleaned off. If this is neglected the holes will become choked with mortar at some of the joints making it almost impossible to insert the reinforcing rods. For this same reason the holes in piers and straight walls that have to be reinforced should be directly above each other where it is possible. Piers of large dimensions can be built with 2 inch tile and filled with reinforced concrete. The pressure of the wet concrete, however, will have to be provided for by braces.

It is not necessary to provide lintels to go across small openings in tile buildings, the tile itself with good cement mortar will be sufficient; sometimes spans of 6 or 8 feet have been built in this way without even cracking. The best way to make lintels for wide openings or in foundation walls is to build across a form or window frame that has been braced with 2 inch tile, a course in line with outside of wall and one with inside of wall as illustrated in Fig. 3. Fill the space with reinforced concrete and you will have an

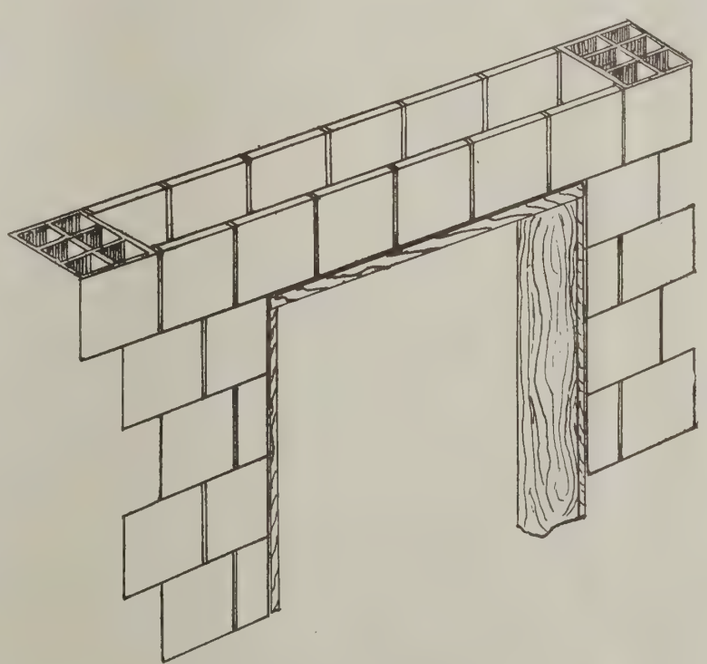

FIG. 3. METHOD OF BUILDING LINTEL.

8x12 concrete lintel. Some provision should be made for pressure by bracing.

This lintel is much better than a plan given by a Corrugated Iron Bar Company, in which tile the same width as the walls was shown laid end on end with the holes horizontal and made long enough to cross the opening. These were filled with reinforced concrete. The trouble with this method is that the concrete cannot be forced in the holes when laid flat across the opening, and if made standing on end it would take a power hoist to lift in place.

Much time is lost in building with tile if the attempt is made to cut to exact story height.

Tile are difficult to cut down from the end and some other way should be found to get as near as it is necessary to height. All sizes are sent with several wire cut tile. If these are kept back they sometimes become useful to get to height desired.

Most of the other difficulties that occur can be worked out by any good bricklayer or stonemason, to the satisfaction of owner and architect.

USUAL PRACTICE IN BRICK WORK

THE usual method of leaving a brick wall which is to be continued at some future time is to tooth the same, which consists in leaving each header projecting 2¼ inches beyond the stretching courses above and below to allow the new work to be bonded to the old as shown in Fig. 2.

The usual practice in joining new cross walls to old main walls is to cut out a number of rectangular recesses in the main walls equal in width to the width of the cross walls, three courses in height, and half a brick in depth, a space of three courses being left between the sinkings (as shown in Fig. 1); the new cross wall is then bonded into the recesses with cement mortar to avoid any settlement. It is necessary that the sinkings should not be less than 9 inches apart, as in the cutting the portion between is likely to become shaken and cracked.

FIG. 1.

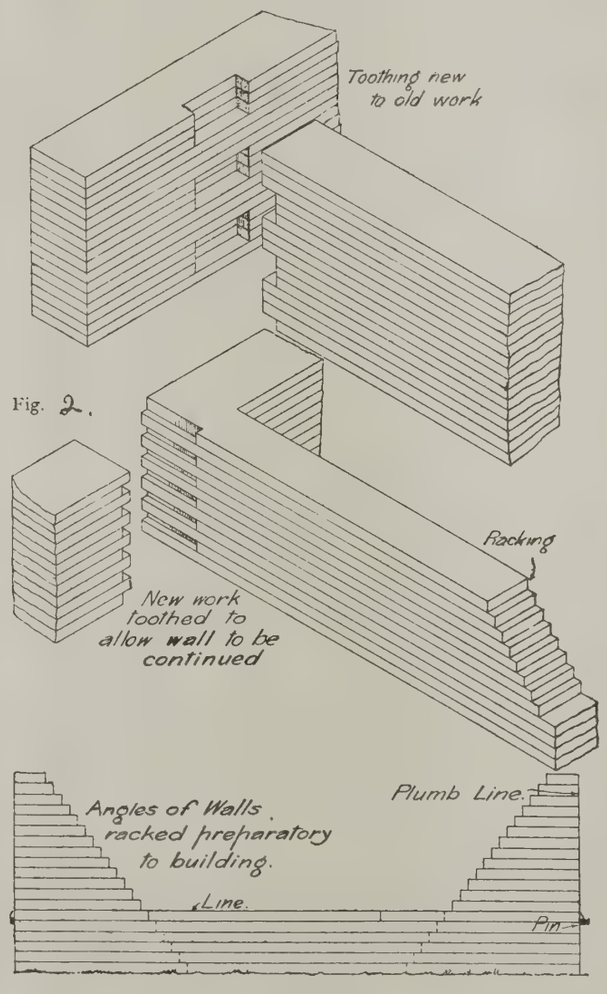

FIG. 3.

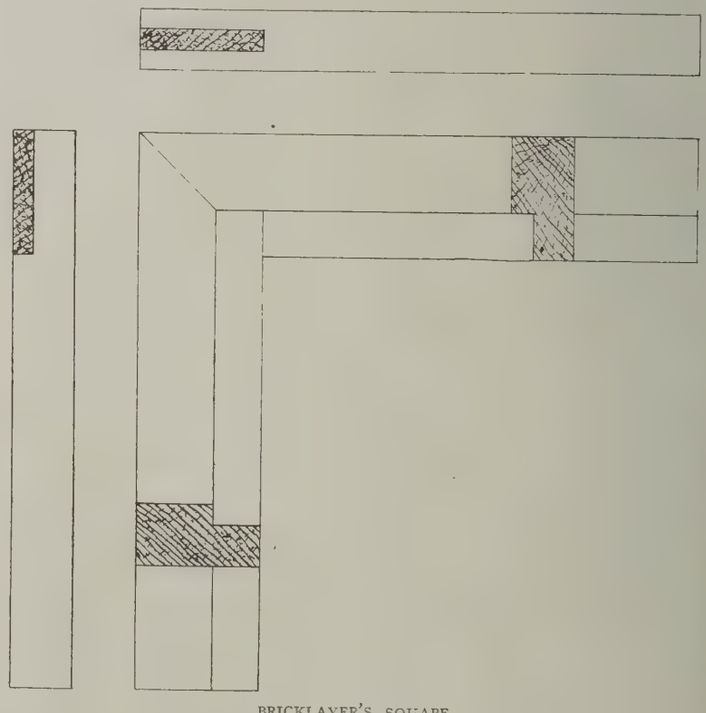
Racking is the term applied to the method of arranging the edge of a brick wall, part of which is unavoidably delayed while the remainder is carried up. The unfinished edge must not be built vertically or simply toothed, but should be set back 2¼ inches at each course, to reduce the possibility and the unsightliness of defects caused by any settlement that may take place in the most recently built portion of the wall.



Also where new walls are erected the usual method of procedure is to build what is technically termed a corner, that is, the angles or the extremities of the walls, to a height of two or three feet, the angle bricks being carefully plumbed on both faces. The base of the corner is extended along the wall, and is racked back as the work is carried up, as shown in Fig. 3. The intermediate portion of the wall is then built between the two corners, the bricks in the courses being kept level and straight by building their upper edges to a line strained between the two corners.

A BRICKLAYER'S SQUARE

EDITOR NATIONAL BUILDER: I am sending you a plan of a square that I think saves considerable time when building a chimney, and one desires letting the top courses project out. It is used for squaring the corner bricks.

I do not claim to be the inventor, but have not seen the square used very frequently, nor have ever seen it advertised.

The plan is about one-third size. It can be made any size to suit the requirements. W. A. W.

BRICKLAYER'S SQUARE.

A writer in the "Zeitschrift fur Vermessungswesen" states that the slide-rule was invented 300 years ago, and calls attention to the fact that Gunter, shortly after the production of his logarithm tables in 1620, had logarithmic schemes engraved on wooden rules, and performed the operations of multiplication and division by subtracting the logarithms by means of dividers. In 1627, Wingate facilitated this operation by engraving the scales on separate rules sliding in one another, and in 1657, or over 250 years ago, Partridge brought out a slide-rule very similar to that used today.

SEDELIA IN THE PAISLEY ABBEY, SCOTLAND

Drawn From Measurement—By John Y. Dunlop

THE sedelia, which are the seats for the high priests, built in masonry, is generally built on the south wall of the chancel.

Fig. 1 shows the front elevation with three seats, and is said to be the only one of that number in existence.

The lines of the tracery, which is of the decorated style, are very rich.

The general appearance is simple, caused by the graceful grouping of the various circles, and magnificent by the varying

size of the circles and the richness of the geometrical tracery. Figs. 4, 5 and 6 show the section of the jamb, lintel, and the front edge of the seat.

In each of those hollow moulding are very prevalent, these being special characteristics of the style.

This old monastery, of which the charter was confirmed in 1172, is of most beautiful proportions.

The walls of some part upon which there are many curious pieces of sculpture, are in a ruinous condition, and only about ten feet in height. On the south side near the east, where the high altar stood, are the graceful and highly decorated remains of the sedelia, Fig. 3.

The whole edifice of the once famous monastery, which stands as usual, with ancient churches, east and west, was 265 feet in length.

It would be most interesting to know who was the architect that designed in such beautiful proportions and symmetry, both internally and externally, the church of the old Paisley monastery.

BUILDINGS OF ADOBE BRICK

ADOBE is pronounced as if it were spelt doby, and adobe bricks are made of soil selected for the purpose, generally a mixture of clay and sand, and they are dried by the heat of the sun. These bricks can be, and frequently are, used for building through all the west half of the United States. The reason adobe is suited to this region is because there is never rain and moist atmosphere enough to dissolve, or in any manner affect their durability, though Northern California is an exception, for there the fall rains are occasionally so prolonged that this material is unsafe, and some houses built with it have fallen, or rather melted and sunk into the original mortar.

With the Mexicans, adobe is a favorite material; they build stables, dwellings, and churches with it, and there are adobe houses in Santa Fé and El Pasco erected fifty years ago, which are apparently as firm as when first put up. All the forts of the old fur traders, such as Bent's, Lupton, St. Vrain, and the like were adobe, and although they were vacated many years ago and dismantled, having no kind of protection on the top of the walls, the rains have made but little impression upon them. But it is usually considered necessary that the top of an adobe wall have a cover of wood, or of stone, or of burned brick. At Salt Lake the old Temple was adobe, and also the high wall around Temple square, while other structures and dwellings, many quite costly were of the same material. At present, however, all the business blocks are of burned brick, not perhaps because such are more durable, but because a great obstacle is presented in rain storms coming unexpectedly while the adobe is drying or are laid in the wall, since if a rain is heavy the whole is likely to go to ruin; therefore, they who are able and who are in a hurry cannot afford to run risks.

Still, adobe is the poor man's material, and a house once built of it is lasting, and it is comfortable in the extreme; for, as the bricks are laid in mortar of the same material, the wall becomes as firm as if of one unbroken mass; indeed, it is more solid than a wall of burned brick. The rooms are warm in winter and cool in summer, and the fierce and terrible winds blowing for days together are unfelt and unheard. When an adobe brick is thoroughly dried, which in summer requires about a week, it is hard and heavy, and it rings under a trowel almost like a burned brick. If put in water it will return to its original mud in about thirty minutes; but while in a wall, and having been thoroughly dried, the ordinary rain of the country may beat on it all day and make no great impression. However, those who live in adobe houses are always willing to have the rain stop, unless there is a porch or other projection.

The Salt Lake people devised a plan of plastering the outside with lime mortar, but it was not until they had made many experiments; for adobe plastering, though good for the inside, is worthless outside, as it washes quickly away, and lime mortar will not stick; but when shingle nails are driven into the wall 6 inches apart, then the mortar sticks, making an excellent stucco, and being painted or whitewashed the finish is beautiful; there is no more trouble, and the wall may be considered as indestructible as anything on earth. It is likely that an adobe building, well constructed and protected, will last thousands of years, for the material becomes so hard that no part of it wears away or crumbles. In New Mexico the women perform the duty of repairing the walls every spring by plastering over such parts as have suffered injury from beating rains or other causes, and the work is slight, for it is only required to mix the soil with water and lay it on in mortar.

One might at first suppose an adobe house extremely cheap, made as it is of a materal that costs nothing, and which is under one's feet; but this is not exactly the case, for the labor is so hard and the process is so long that those not accustomed to working in adobe are apt to get discouraged, or they may work so rapidly that the walls break down before they are dry, or a sudden rain may spoil many bricks ready for use; hence it has resulted that adobe ceases to be popular, especially with eastern men, and they forego all the benefits on account of the difficulties which they have not the patience to overcome.

It is indispensable that lumber shall be on hand to keep adobe brick from getting wet. It is true that months may pass when no rain falls, and during which they will become thoroughly dry; but there is a risk, and it is probably true that no pursuit carried on by day labor can be continued if there are risks. Only capital can afford to run risks, if they are profitable. When several thousand adobe brick are laid out in a yard to dry they become strong enough in a couple of days to be ranked one on top of another, so as to admit the air and yet to occupy a small space; but boards must be ready to cover them in case of rain. This is said of such bricks as are of the size of burned brick, but experience has proved that a larger size is more profitable, and such are usually made. These will require four days to dry so that they can be moved, and it follows that the expense of covering small ones which occupy greater space is nearly balanced by the risk and time involved in making larger ones, and the difficulties are about equal.

HARDWOOD FLOORING

HAVE you ever glanced down the columns of your local paper you have, you must have noticed how owners, investors and under the caption of "Residence Property for Sale"? If real estate dealers feature the most important parts of the construction. If oak flooring is used, they always draw particular attention to that fact. There are good reasons why they do this. Oak flooring is a most important factor when it comes to renting or selling a residence, as there is no other part of the construction that helps more to beautify a home, as its colors are soft, rich and cheerful and tones up a home just as much as furniture. It gives an air of refinement and elegance to a home, whether it be in a humble cottage or a mansion.

AN ECONOMICAL USE OF OAK FLOORING.

The standard thickness of oak flooring are 13/16 and 3/8 inch thicknesses. The 13/16 inch thickness makes the most substantial floor, and usually is about 35 per cent more expensive than 3/8 inch. The 3/8 inch oak flooring can be laid over old floors very economically, taking the place of carpets, without in any way interfering with the woodwork of a room. When laid it has the appearance of heavy flooring, and not even an expert could detect its thickness. The highest quality of clear quartered oak flooring 3/8 in. x 2 in. wide can be bought, laid and polished for half the cost of fair quality of carpet, which proves that carpets are an expensive luxury, as compared with oak flooring.

ADAPTABILITY OF VARIOUS GRADES.

The following is a general outline of the uses that are generally made of the various grades of oak flooring:

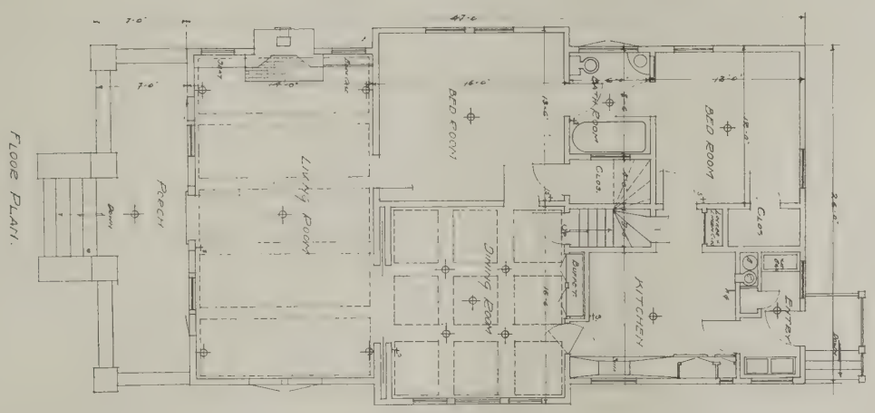
Clear quarter-sawed or first grade.—For high class residences, hotels, apartment houses and club houses.

Sappy clear quartered or second grade.—An economical substitute where a dark finish is desired. This grade is as durable a floor as the clear grade.

Clear plain sawed or first grade.—For high class residences, hotels, apartment houses, churches and club houses.

Select plain sawed or second grade.—For medium-priced residences, hotels and apartments, schools, office buildings and stores.

No. 1 common or third grade.—For dwellings, tenements, stores, high class factories and manufacturers' buildings.



Factory or fourth grade.—For warehouses, factories and cheap tenements.

"Say, when are you going to pay me that money you owe me?"

"My dear fellow, I'm not a prophet."—Lippincott's.

BUNGALOW, OAKLAND, CAL.

THIS house, designed and built by Price Bros., Oakland, Cal., appears to be an unusually valuable one for the reason that it gives practically an eight-room house and for a cost of about $3,000 in Oakland, where it has recently been built. With the three upstairs rooms and bathroom not finished, as indicated in the drawings, it would cost about $500 less.

The exterior is of the handsome bungalow type with good and pleasing relief produced by the various courses of siding, first the lap siding to the bottom of window sills, then shingles and last the vertical siding with battens in the gables.

The front dormer helps form one of the second-floor rooms, and the rear dormer is left open for a sun balcony.

The tapered window casings add an artistic effect that is very popular at present.

The porch columns and trimmings, as well as the large outside chimney are clinker brick with a large fireplace in the living-room, made of Carnegie tile. This living-room is very roomy, extending across the entire front. This living-room and dining-room have beam ceilings, a bungalow essential.

The two bed-rooms on the first floor are each directly accessable to the bath-room, and each have large closets.

The kitchen is most conveniently arranged with cupboards, sink and shelving, as well as a cooling cabinet.

The entire floor plan shows a very careful study of home requirements.

For the investment it would seem that this design is difficult to excel.

FLOOR SCRAPERS

WE have reached the age in building where the floor scraper is as essential a part of the builder's tool equipment as the plumb bob and the level almost. We have gotten away from the old method of building a plain floor and covering it over with carpets, and the disposition today where a good house is built, no matter whether it is a cottage or a mansion, is a hardwood floor, and it is necessary to finish this floor off by scraping it. One of the things that has delayed the coming of the hardwood floor has been the indisposition on the part of carpenters to lay and finish them, and often this indisposition is traceable directly to the lack of being equipped with tools for scraping and finishing.

The carpenter that goes without this equipment is simply standing in his own light. He should have something of the kind, have the best that is offered if he can get it, and his work will justify it, but have something anyway. It is not the easiest thing in the world to decide which is the best floor scraper offered and which may be best for each individual builder. There are probably some that give better service than others, and there are probably many which would give better service if they were better handled and cared for. This is a matter for each man to figure out for himself after thoroughly investigating all the offerings.

HOW TO DRAW A STORE FRONT

By CHAS. CLOUKEY

THE store front is an important branch of carpenter work which any good carpenter can lay out and put through with satisfaction and profit, if he is able to understand the requirements or rather the desires of the owner.

It is not often that the ordinary tradesman has to get out the store fronts for new work of much pretension, as such construction is usually included in the general contract and let along with the other mill work. But there are so many cases where the taking out of the old style fronts nad putting the mod-

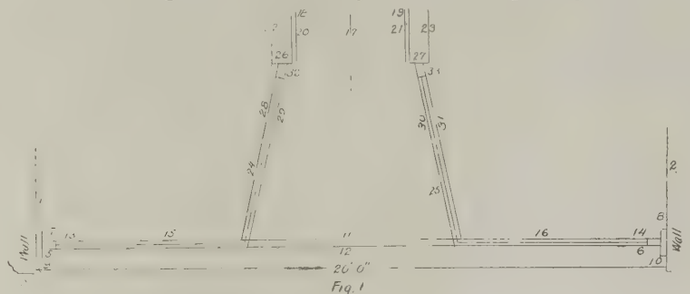


Fig. 1

ern show window fronts constitutes a separate job, that many carpenters take hold and figure this kind of work, although they attempt nothing in the regular contracting line.

To be able to make a good scale drawing of a proposed store front, showing up the several desirable features clearly so that the owner catches the idea of every part and can see just about how it will look when completed, will often mean the securing of the contract, all other things being equal.

But just how to go about making the necessary drawings when the essential figures are given is a puzzling problem for many a carpenter who has no very wide experience as a draftsman. So let us see what we would do if we got the following specifications to work into a plan and elevation for a common sized front.

Whole opening, 20 by 14 feet.

Front and recess glass to be polished plate, 72x86 inches, mitered.

Door 3 ft. 6 in. by 7 ft. 6 in., 2¼ in. thick, with plate glass, one light.

Paneled base below sash sill, 24 in. from bottom of front to bottom of plate.

Floor of recess to have 1½ in. fall.

Transom bar to be about 8 in. wide and transom to be divided into three lights.

Transom to be full width of front over the front plates.

The above specifications are enough for the purpose of making the drawing, as it does not make any difference in the lines whether the transom glass is double strength sheet, prism sheet, prism lights set in lead or copper, or if the lights are plain or beveled

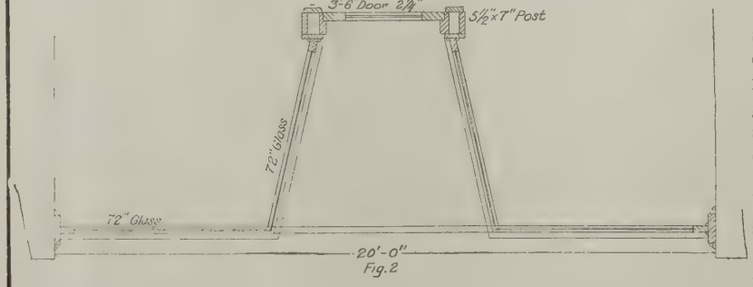

Fig. 2

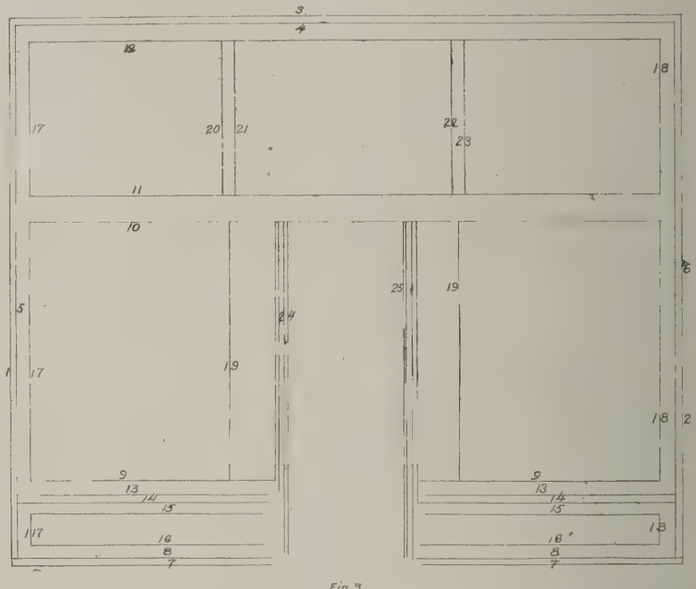
plate, unless the carpenter making the drawing wishes to show how the small lights would look. It makes no difference with the woodwork, as the glass is stopped in from both sides.

Now if we are ready to begin, let us get a good smooth piece of paper, and if we cannot get hold of a sheet of detail paper, let's find something in a good heavy manilla wrapping paper, as this is about the right color and will stand lots of wear. It is not best to attempt such drawings on white paper, as they are almost sure to get so soiled that we are ashamed to show them to our customers, and at the same time dislike very much to do the work all over again.

Now get a smooth board and square it up for a drafting table if you haven't already got one, and make a T square with a tongue about 3 feet long.



Fasten your paper on the board with thumb or other tacks, being sure that it lies smoothly.

I should have said before this that the scale of 1½ inch to the foot is a very good size to use for a store front, as it works out ⅛ of an inch to every inch of the full sized work. This would make the drawing of the elevation of the store front specified, 30" wide and 21" high and the drawing of the plan would be 30" wide and about 12 deep.

Now, referring to Fig. 1, we see that the lines are numbered from 1 to 33, which is as far as we can go in the first illustration without confusing the learner and making him lose track of the simplest way to draw the whole.

Lay the rule on the paper to be sure that the contemplated drawing will have enough room and to spare before beginning to draw. Now draw the first line back a convenient distance and then measure off the 20 feet to the right and draw the second line. The lines 3 and 4 make the angles of the wall and at once give the visible bounds of the work in width.

The lines 5 and 6 represent the face of the jambs outside of the store front proper, and their location back from the corner of the brick often depends upon the location of the I beams which

Fig. 3

support the superstructure; anyway it is necessary to locate them at the building. The short lines 7, 8, 9, and 10 complete the outlines of the jamb sections.

The two full lines 11 and 12 serve as the location for the main sash and transom of the front. 13 and 14 are the short lines which cut off the amount of width required in the stile of the sash. This may vary to suit the owner, and in this style of front may vary a good deal without having any noticeable effect upon the front as a whole, as it only makes the outside space of the recess a little more or less.

As this front shows a mitred plate glass and has no sash or bar at the angle, the lines 15 and 16 are run out 6 ft. from the sash which will be 9 inches on the drawing.

So far everything has been easy, but now we come to the hardest part of the whole task which is locating the door just far enough back so that the 72" glass and sash will just reach the outside casing of the door post. As the door is in the middle of this front, let line 17 be the center line, and draw it lightly as also all the lines from 17 to 23 as the greater part of all of them will have to be erased before the drawing is complete. The reason these lines are drawn so long is that we cannot tell exactly where the door is to come when we draw the lines. 21 inches on either side of the center line draw the lines 18 and 19 which give the width and lateral location of the 3' 6" door. ½ inside of these are drawn 20 and 21 which form the door rabbet and also the inside edge of the post. 22 and 23 are drawn 5" outside of the door line and form the opposite side of the posts.

Now returning to our mitred corners, we draw the other two glass lines 24 and 25, aiming them at the middle of the space marked off for the door posts. At the end of the 72″ we add the width of the sash and make the lines 26 and 27 which become the outer faces of the outside casings of the door posts. 28 to 31 inclusive are the sash lines for the recess lights, while 32 and 33 mark of the width of the recess sash.

We now pass to Fig. 2 which is the completed drawing of Fig. 1 and shows how the posts are developed and the door drawn into the plan. The sill lines on the outside of the sash are not drawn until the section is developed in connection with the elevation drawing, showing the width of the sill.

In Fig. 3 it will be seen that the first 6 lines serve to outline jamb opening, while the next two show the lower sills. These horizontal lines are numbered the same on both sides as they are drawn with the same stroke but broken in the middle for the recess. Here too, the lines should be light to facilitate erasing, as we do not know just now where all the vertical lines will fall.

Measuring off 2 feet from the bottom, we draw 9 which is the bottom of the plate. Then going up 84¼ inches draw 10, and 7½ inches farther draw 11. As the specification calls for about 8 inches in the bar, we make it 7½ as that will work out of an 8″ plank. Coming down 4 in. from the jamb at the top, we draw the top rail of the transom in line 12. Line 13 is the bottom of the sash, 14 the bottom of the sill and 15 and 16 are the outlines of the panel in the base.

As the horizontal lines given in this figure are all drawn, it is now best to slip the drawing, Fig. 2, under the bottom of this sheet of paper, having the jamb lines coincide perfectly and the front line parallel with the base of the elevation. We are now able to square up from our plan to get all of the vertical lines without going to the bother of measuring them off. Now finish all the lines given in Fig. 3 and draw lightly the bottom part of the door post lines.

From the base line measure up 2 inches to get the bottom of the door and then drop a half-inch from that to get the floor line.

Now it is better to shift and draw in the section as shown at *c c*, or this section may be placed outside of the elevation and figures, if it is likely to be confusing to the customer through having it break into the elevation as shown in the figure. But the reason for developing it at this time is to get the projection of the sills and place them on the floor plan. From there they may be squared up to the proper place on the elevation as shown at *a a*. After having located *a* it is easy to continue the base line to *b*, which is the floor line at the door.

It is difficult to see it, but the slant of 1½ in. is divided up between the bottom rail and the panel in the recess base and looks better this way than to take it all out of the panel.

As the door plate lines up with the front plates, it makes the bottom rail 22″ wide. If the door is to be made by hand it would be better to draw in a panel at the bottom; and if the paneled base

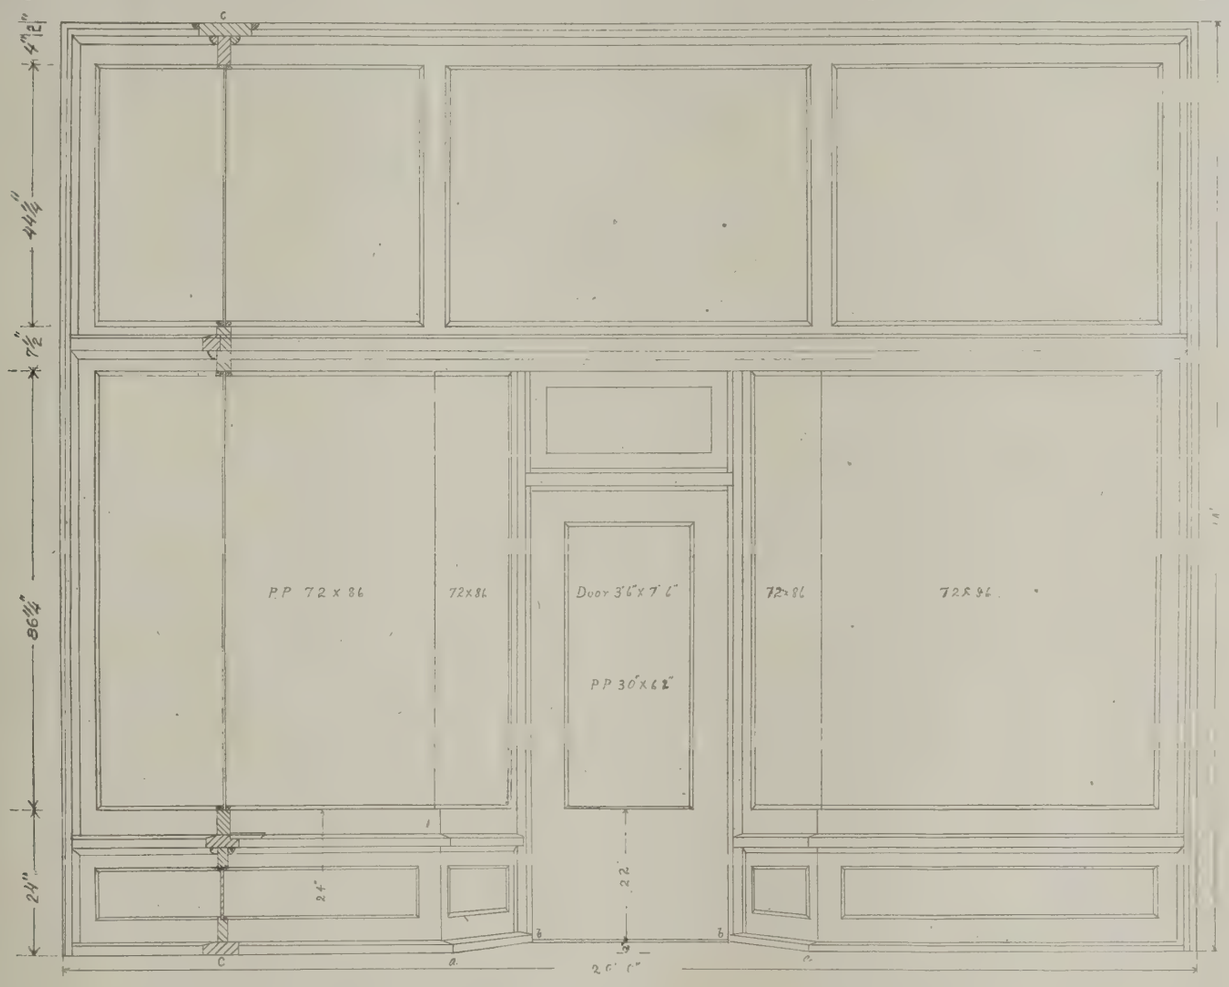


Fig. 4

were a little higher, the door could take the same panel as the base. Allowing 6 in. for stiles and top rail outside of the glass, this will make the door plate 30″x60″.

The exact height of the transom over the door and of the glass in the large transom are usually incidentals which are determined as the drawing develops, and rarely occur except approximately in the specifications.

In Fig. 4 is given the detailed height in figures at the left, and for the large lights ¼-inch play is allowed and this is not too much.

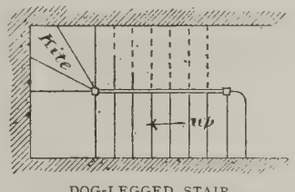
It is very seldom that a customer will ask for further details than are shown on the plan and elevation, and as this article does not contemplate the detailing of a store front, I will not confuse the reader by showing any more than those given in the section *c. c.*

It will be understood that the elevation shown in Fig. 4 may be drawn with fewer lines by not drawing in all the stops and mouldings, and the draftsmen can use his judgment as to whether it will be wise for him to spend the extra time for this purpose.

Wherever the lines have been made light for the purpose of erasing a portion of them, the remaining part should be gone over and made of a uniform strength. Avoid using a dull pencil or one that is very hard or very soft. The hard pencil will make creases in the sheet so that the erasures will show too plainly, and the very soft pencil will smudge the paper. Try and have all the lines accurate and sharp so that the drawing will stand out like a picture, and if you don't land the job it will be a pure case of bad luck!

STAIRS AND THEIR CONSTRUCTION

Materials.—Stairs are made in stone, concrete, brick, iron, and timber; all but the latter two have been already treated.



Iron Stairs.—Iron stairs are used for internal and external construction, where there is a minimum of space to be occupied, and where the least obstruction to light and air, and a measure of fire-resistance and economy are chiefly required, such as where the internal plan space is small, spiral steps are used, and for external area steps; they are not combustible, but they are slippery when worn, and are not much used for other purposes.

Planning of Stairs.—Buildings should be designed for and provided with convenient staircases, and the planning of the stairs considered as of primary, and not of secondary importance.

Design of Stairs.—Properly designed stairs should (a) be well lighted and ventilated directly from the exterior; (b) have the approaches convenient and spacious; (c) have the headroom in no case less than 7 feet measured vertically; (d) have a clear width between the strings of the straight portion of flights kept at all turns, landings, and approaches; (e) have the stairs of a convenient and easy pitch; (f) not have a landing between two adjacent flights, the center lines of which are in one straight line, with a length less than the width of the adjoining stairs; (g) have winders (if any at all) at the bottom and not at the top of a flight; (h) have not less than four steps in each flight.

The non-compliance with these conditions has resulted in numerous accidents.

Technical Terms.—Stairs.—Timber stairs or steps consist of a number of wooden blocks or casings fitted into, or resting upon inclined beams called strings and carriages, which distribute the load upon the main members of adjacent floors.

DOG-LEGGED STAIR

FIG. 1.

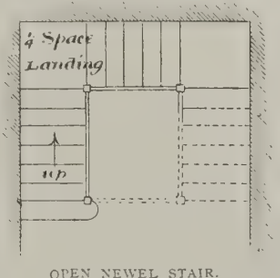
Staircase.—The chamber containing the stairs is usually known as the staircase.

Tread.—The upper surface of a step upon which the foot is placed.

Nosing.—The exposed edge of the tread, usually projecting and moulded.

Riser.—The face of the vertical member directly between the nosing of an upper and the back edge of the lower step.

Fliers.—Steps rectangular in plan.



Winders.—Steps tapering in plan. Those fitting into a wall angle, as shown in Figure 1, are called kite winders.

Going.—The horizontal distance between two riser faces.

Rise.—The vertical height between two tread faces.

Flight.—A series of steps without a landing.

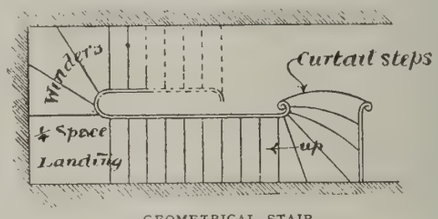
Landing.—The level platform at the top of a flight between floors.

OPEN NEWEL STAIR.

FIG. 2.

Half-space Landing.—A rectangular landing extending across the widths of two flights and against one edge, of which both flights abut, and on which a half turn is made.

Quarter-space Landing.—A rectangular landing, the breadth and length of which are of the dimensions of the two abutting flights, as shown in Figure 2, and on which a quarter turn is made.



Line of Nosings.—An imaginary line parallel to the strings and tangential to the nosings. It is useful in the construction of handrails, giving the line with which the under-surface of the handrail should coincide.

Newels.—Posts forming the junction of flights of stairs with landings or other flats.

If the outline plan of newel stairs enclose a space or solid they are known as open or solid newels respectively.

Straight Stair.—Flight or flights of parallel fliers that may be seen from top to bottom, the centers of which being in the same straight line.

Open Newel.—Stairs, the turns of which have newels and enclose a well.

GEOMETRICAL STAIR.

FIG. 3.

Dog-legged Stair.—A flight of stairs with abrupt angular turns, usually about a newel, and often with winders and landing. The name is given owing to its supposed resemblance to a dog's hind leg, as shown in Figure 1.

Geometrical Stair.—Stairs having continuous strings or handrail, and usually compassing a well. Typical examples of those rectangular and circular in plan are shown in Figures 3 and 4.

Solid Newel.—Stairs radiating from a solid central newel, circular or rectangular in section.

Ramp.—A plane curve without change of direction, and occurs in handrails, as shown later, and in those parts of strings over windows and landings.

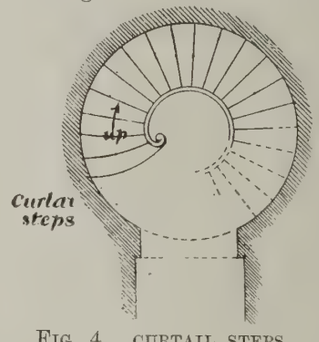


FIG. 4. CURTAIL STEPS.

Swansneck.—A plane continuous curve, such as would be formed by joining a concave with a convex ramp.

Iron Core.—The iron band about 3-16 inch to ¼ inch in thickness, used in the handrail and to which the balusters are fixed. Iron cores, are used in all stairs having iron balusters.

Balusters.—Vertical members between the handrail and strings to stiffen the handrail and prevent persons falling through.

Balusters should be tenoned to close strings and handrails, and dovetailed to the treads of cut strings, the return moulding of tread being planted, mitred, with returned end and covering the dovetail.

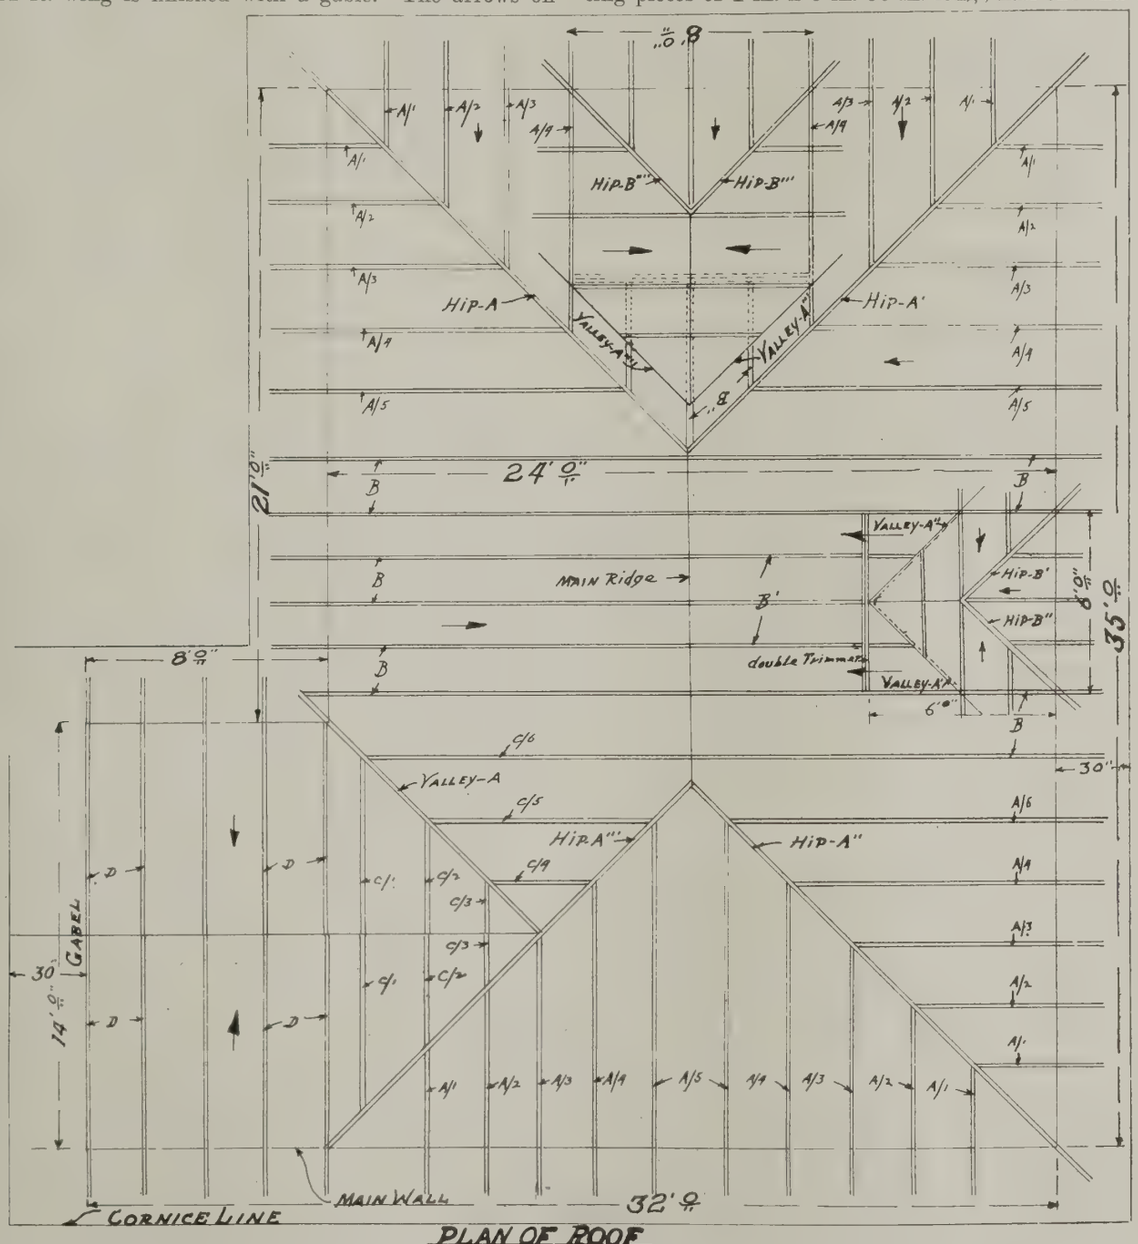
There are usually two balusters for each step of a cut string, and in close strings they are placed about 4 inches apart.

Balustrade.—The framed fence formed by strings, handrails, and balusters.

Curtail Step.—A step, the outer end of which follows the plan of a spiral scroll, and under which it is directly situated.

Bull-nose Step.—Steps with rounded ends, and may be quarter round, or half round.

Built-up Steps.—Wooden steps are usually built up of a number of comparatively thin casings, and dressed only on the seen faces. Each step takes a bearing on at least two or three varriages, or rough, or dressed strings, the soffit of which is plastered, or it may be boarded. The space enclosed is sometimes objected to as being unsanitary. (To be continued.)



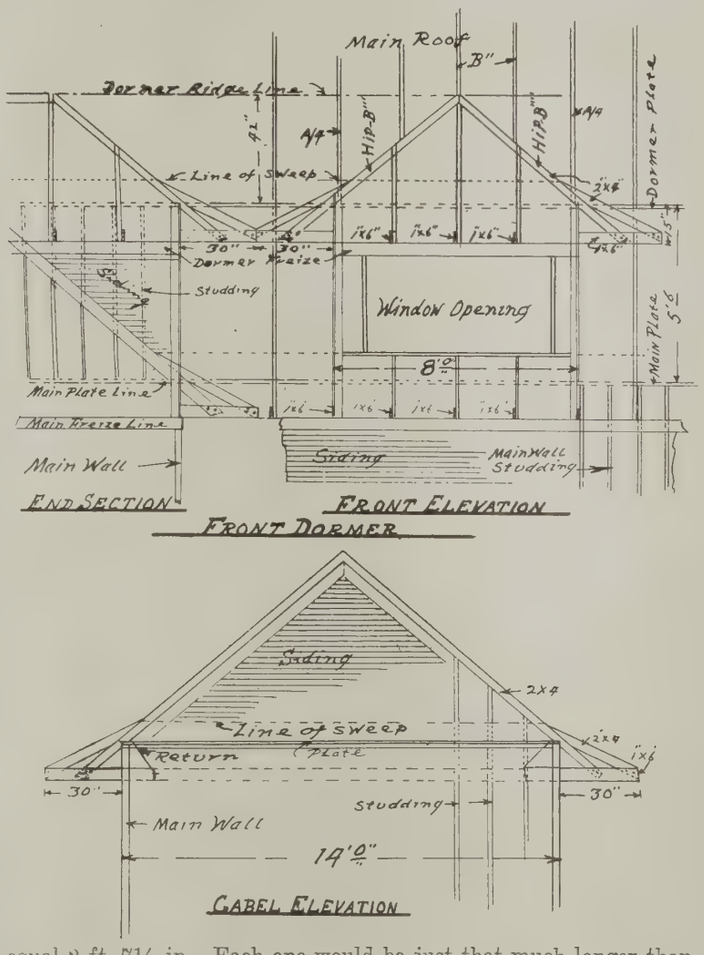
AN EXAMPLE IN ROOF FRAMING

By WM. C. A. STEVENSON

WHILE roof framing is undergoing a period of discussion in the columns of the NATIONAL BUILDER the writer feels it to be a proper time to submit another article that seems to him to be an extra good example, inasmuch as it not only deals with the problem of finding lengths, but also with framing for a sweep at the eaves and the framing in for dormers (a question that was recently asked). The drawings show the roof plan and the elevations of the frame of the front dormer and gable. Referring to the plan of roof, we see that the main building is 24 ft. x 35 ft., which is covered with a hip roof at both ends, with an 8 ft. dormer in the front and a 6 ft. dormer in the side; these also have hip roofs and a 30 in. cornice with a sweep the same as the main roof. The 8 ft. x 14 ft. wing is finished with a gable. The arrows on the plan point in the up direction of the roof on all sides. All the rafters in the main roof are marked as follows: The four long hips are all the same length, but in order to designate any particular one of them I have marked them A, A′, A″, A‴. There is only one valley in the main roof marked A, valleys A′, A″, A‴, and A⁗ being formed by the dormers setting on the main roof. The common rafters are marked B on the main roof, and D on the wing; there are five different jacks in the main roof of which there are 3½ pair of each A/1 to A/5. The cripples are marked C/1 to C/6; hips B′, B″, B‴, and B⁗ are on the two dormers, the jacks on the dormers I have not marked, but will discuss them later. The front dormer end and front elevation show the manner of framing. It will be noticed on the plan that jacks A/4 are set to suit the width of this dormer 8 ft. outside; the studding for the wall of the dormer being set plumb with the outside of these rafters. In this case the plates are made 5 ft. 6 in. above the main plate, the double trimmer being cut between the rafters A/4 just where the dormer plate meets the main roof, which will be found to be about 6 ft. 6 in. in from the plumb of the outside wall; rafters B″ are then cut from this trimmer to the hips in the main roof, the main roof boards being run across and the dormer cripples cut down onto the main roof boards thus forming the dormer valleys A‴ A⁗.

The manner of forming the sweep in the roof is done by cutting pieces of 1 in. x 6 in. 30 in. long; nail one end to the wall of building 15 in. below the top of plate; nail it to the tail of rafter which has been left to hang over as shown. Then pieces of 2 in. x 4 in. are cut to fit on top of the rafter, nailing one end onto the rafter at the sweep line and the other end to the 1 in. x 6 in., taking care to keep the 1 in. x 6 in. lookouts level and in line. The other dormer and the main roof is formed in precisely the same manner. However, when we come to the gable over the wing we meet a different proposition. We must either build a return as shown for the gable cornice to die down on, or extend the sweep across the end as indicated by the dotted lines.

Hip A‴ will only show as a hip above the point where the



PLAN OF ROOF

valley A and the ridge of the wing intersect with it. It is extended down to the main plate in order to gain support for the roof. Cripples C/2 and C/3 and jacks A/1 and A/2 when nailed to the hip, in reality form a common D, as the reader will see by a moment's study of the plan.

PITCHES, LENGTHS AND BEVELS.

The pitch of this roof is 10 in. rise to the foot run—dormers as well. It ought not be necessary to go into this part of the question to any great length, as it was dealt with in my article in January; however, for the benefit of those who may not have that copy, I will briefly tell how to find the lengths for this roof.

For a rise of 10 in. to the foot, the length of the common is found to be 15⅝ in. to each foot of run; as the run in this case is just 12 ft. it would be 12x15⅝ equal 187½ in., or 15 ft. 7½ in. The figures 10 and 12 on the square give the foot and plumb cut. Half the thickness of the ridge must be cut from this length. The top of the main ridge will be 10 ft. plus 2 in., the portion of the rafter standing above the plate. The run of the long hips A, A′, A″, and A‴ is the square of 12 equal 17, then 17 x the rise 10 on the square 19¾ in. x 12 equal 19 ft. 9 in.; figures 10 and 17 on the square giving the bevels for the cuts. To cut the cheek cut for the hip to fit the ridge: Use the figures 13 and 15, cut on the 15 side; the first jack set 2 ft. from the corner would be 2x15⅝ in.

equal 2 ft. 7¼ in. Each one would be just that much longer than the one before it; the same figures used for the common would give the foot and plumb cut; the cheek cut to fit the hip would be found by using the figures 10 and 13 cut on the 13 side. To find the length of cripples scale the run of them on your draft and multiply by 15⅝ in. for each foot run. Example: C/4 is found to have a run of 3 ft. 6 in. x 15⅝ in. equal 54¾ in, or 4 ft. 6¾ in. long short to long point. The cheek bevels are found same as for jacks.

The commons D have a run of 7 ft. then 7x15⅝ in. equal 119⅜, or 8 ft. 9⅜ in. long, same bevels as long commons. Valley A has a run of the square of 7 or 9 11/12 in., the rise is 7 x10 equal 70 in., or 5 ft. 10 in. Then to get the length of valley A use the figures 9 11/12 and 5 10/12 on the square and we get 11 6/12 equal 11 ft. 6 in. long, same bevel as long hips, except it has no cheek cut, as it fits fair against the hip A‴. It must, however, be cut half the thickness of hip shorter than length given.

The ridge of the 6 ft. dormer will be 30 in. plus 2 in. above its plates, and the 8 ft. dormer 40 in. plus 2 in. above its plates. The hips on the 6 ft. one will be 4 ft. 11¼ in. long; on the 8 ft. one, 6 ft. 7 in. long. The bevels and lengths of jacks will be found the same as for the main roof.

It must be remembered that the figures given apply only to a roof of this pitch, 10 in. rise to the foot run.

LUMBER CALCULATION, SHORT METHODS

By E. P. HOERR

ANY man who has lumber to figure will do well to have the following table of aliquot parts. He will then be able to extend promptly and accurately lumber quantities and prices. In most cases he will find it possible to set out the correct answers with mental calculations, it not being necessary to first set down the examples on a separate paper to figure them out.

His knowledge of this table will place him in a position to figure mentally most any multiplication problem that comes before him. Then it will seem strange to him that he was not obliged to learn it "by heart" while at school.

The following table thoroughly mastered is worth many dollars to anyone:

87½	equals	⅞ of 100	37½	equals	⅜ of 100
83-1-3	equals	⅝ of 100	33 1-3	equals	1-3 of 100
75	equals	¾ of 100	25	equals	¼ of 100
66 2-3	equals	2-3 of 100	16 2-3	equals	1-6 of 100
62½	equals	⅝ of 100	12½	equals	⅛ of 100
50	equals	½ of 100	6¼	equals	1-16 of 100

After learning the table it is necessary to know how to make use of it.

Let us take first the simple figures—

You have bought 654 ft. lumber at $50.00 per thousand feet. What is the price?

If the price were $100.00 per thousand feet it would be seen at a glance that the cost of 654 feet would be $65.40. But the price is only $50.00 or one-half of $100.00, so it would be but $32.70, which is just one-half of the price it is at $100.00 per 1,000 feet. The above table says that 50 equals one-half of 100. We've first found the price at $100.00 per thousand, then taken one-half of that. That's the first rule. Find the cost at a basis of $100.00 per thousand, then take a part of it.

Let us use the same quantity at different prices:

654 feet of lumber at $25.00 per M. equals ¼ of $65.40; 16.35
654 feet of lumber at $12.50 per M. equals ⅛ of $65.40; 8.17
654 feet of lumber at $87.50 per M. equals ⅞ of $65.40; 57.22
654 feet of lumber at $75.00 per M. equals ¾ of $65.40; 49.05

As you can use the table at various prices—say at $62.50 per M, it would be ⅝ of the price at $100.00 per M; at $37.50 M, it would be ⅜ of the price at $100.00 per M.

Now let us use the above table in a different way. Let us figure up a list of lumber quantities at various prices.

Two hundred and fifty feet at $37.50 per M.

You have here the price per M. feet and before setting down figures to multiply in the long way notice that 250 feet is just one-quarter of a thousand feet; so the price would be just one-quarter of what the thousand feet price is—i. e., ¼ of $37.50 equals $9.37.

Three hundred and seventy-five feet at $24.00 per M.

Remember the table; 37½ equals ⅜ of 100; so 375 feet would be ⅜ of a thousand feet—thus ⅜ of a thousand feet at $24.00 per M. would be $9.00.

Seven hundred and fifty feet at $36.00 per M.

This would be ¾ of a thousand at $36.00 per M. or $27.00.

One hundred and twenty-five feet at $48.00 per M.

Would be ⅛ of a thousand at $48.00, or $6.00.

Eight hundred and thirty-three feet at $36.00 per M.

Would be 5-6 of a thousand at $36.00, or $30.00.

Now it must not be thought that each and every number extension can be so easily figured. It will be found though that much time can be saved in using this method, and the whole secret is in knowing this table here given.

You have often seen men calculate quietly, and it is only because they use rules such as these.

Seven hundred and fifty feet at $75.00 per M.

This can be figured by the two methods explained above. First by saying that 750 feet at $100.00 per M. would be $75.00, and that 75 is ¾ of $75.00, or $56.25.

Or you can say that 750 feet is ¾ of a thousand feet at $75.00 per M, getting the same answer, or $56.25.

ADVICE TO ASPIRING CONTRACTORS

By, CHAS. ANDERSON (Concluded from March.)

IN my article in the March number, a brief synopsis was given for keeping accounts; herewith I will endeavor to give a few hints on estimating and keeping the cost of the job.

It is not my purpose to give any lesson in estimating at this time, as space will not permit; in fact, it is too wide a subject to deal with in the brief space allotted (better secure a copy of Hodgson's Estimator and Contractors' Guide, or some other good work of which there are several in the field), but rather to show the importance of making the estimate and the manner of making it, etc.

The specimen estimate sheet illustrated herewith is a good example and shows how it should be made out. The Colonial shingled house published in the March number is taken as an example. The lumber bill only is shown here; but, of course, the whole list of the entire job should be made out.

Keep each list separate, that is the lumber bill on one sheet, mill work on another, etc., etc. The object for this is, so that you can hand a copy of each separate sheet to the men in that particular line to get their figures without having to give them something they do not figure on. You should make as many copies at the one time as you will require to hand out for figures and two for yourself; these can be made by using carbon paper and they will all be exactly alike. When making these out do not put the prices on as shown on the specimen here, but carry these out on one only afterward to file away for your own private information; the other one made for yourself is to carry with you in case you secure the job; this will be found to save considerable trouble, as it will show you what each item was figured for. Without such to guide you or your foreman, materials are very liable to be used in the wrong place, causing a waste of materials, confusion and loss of time.

100	1/12	2 D.4S	Y.P.	Sheeting	100	50.00	5	00
				Total Lumber bill			$529	40

You should number your estimates and number the job if secured to correspond to it. By filing away these sheets they will be found to be of considerable help in figuring on future jobs, and also if some items run over or under the estimate you will be able to correct the error on the next job.

THE COST KEEPING.

In the writer's opinion, one of the most important considerations of all is the keeping the cost of the job, as unless you do so you do not know how you have come out. Many a man has continued losing on job after job and finds it out too late to save himself from ruin, whereas if he had kept account and found he was running behind he might have been able to redeem himself.

The specimen time card shown herewith will be found to minimize the labor very materially in keeping account of the cost.

REC'D PAYMENT _____ WORKMANS SIGNATURE _____

THE WORKMAN WILL STATE ON SPACE BELOW AND OVER SIDE. ANY MATERIALS TAKEN TO JOB BY HIM NOT OTHERWISE ACCOUNTED FOR

See that each workman keeps his time on the card for the work done on the job during the week. If he has worked on more than one job then he must make out a card for the time on each; also, if he has taken any materials to the job from stock he must enter it on the card in the space allotted for that purpose.

By filing all these cards together for each job and also the other material bills, etc. chargeable to the job, it is no trouble to figure by just totaling up all the bills and cards what the job has cost, and also how it was divided up, i. e., how much labor, etc. By crediting any materials that may be left you can easily tell what you have made on the job.

Never put in a 20 horse-power motor and expect to take off 30 horse-power all the time. It can be done for a time, but it does not pay in the end, and is expensive for both armature and field winding and for current. In laying down belt transmissions, or, in fact, transmissions of any kind, it is important not to increase the speed of shafts or machines unnecessarily.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

(Continued from March.)

AS we observed in the study of orthographic projection, three views are generally necessary to properly show the shape and dimensions of an object. But these views do not clearly show the appearance the object would have after it had been constructed, so we sometimes resort to another method of pictorial representation to show this appearance. There are three general methods in use; perspective, isometric projection and oblique projection. This latter is sometimes known as cabinet projection. Perspective is the most difficult to master, and later on an article will be devoted to it, but at present the other two will concern us.

Isometric projection. Besides showing the shape of an object, isometric projection sometimes gives the dimensions, as all lines are drawn full size. Often it gives the object in the drawing a distorted appearance as it makes parts of it look larger than they are in reality. For an explanation of the principles governing this projection, let us consult Plate VIII.

PLATE VIII.—ISOMETRIC PROJECTION.

In Fig. A we have the isometric axes, *a* being a *vertical* line, *b* and *c* lines at an angle of 30 degrees with the horizontal. These axes represent lines mutually perpendicular to each other, and correspond to the three dimensions, length, breadth and height. In Fig. B we have the isometric of a cube. Here we find that the edges are drawn in three fixed directions, respectively parallel to the isometric axes. All of them are in their full length and are either vertical or at an angle of 30 degrees to the horizontal. The view taken is in the direction of the diagonal of the cube, as indicated by the arrow in Fig. C, which is the top view of the cube. The isometric view is always taken in this direction. Note that while all the edges are in their true lengths, the angles are not shown in their true size, right angles being represented at 60 or 120 degrees. Isometric projection the direction of the ray of light is 30 degrees downward to the right, instead of 45 degrees as in orthographic. The shade lines are supposed to divide the light from the shade surfaces, hence the positions of these lines on the plate.

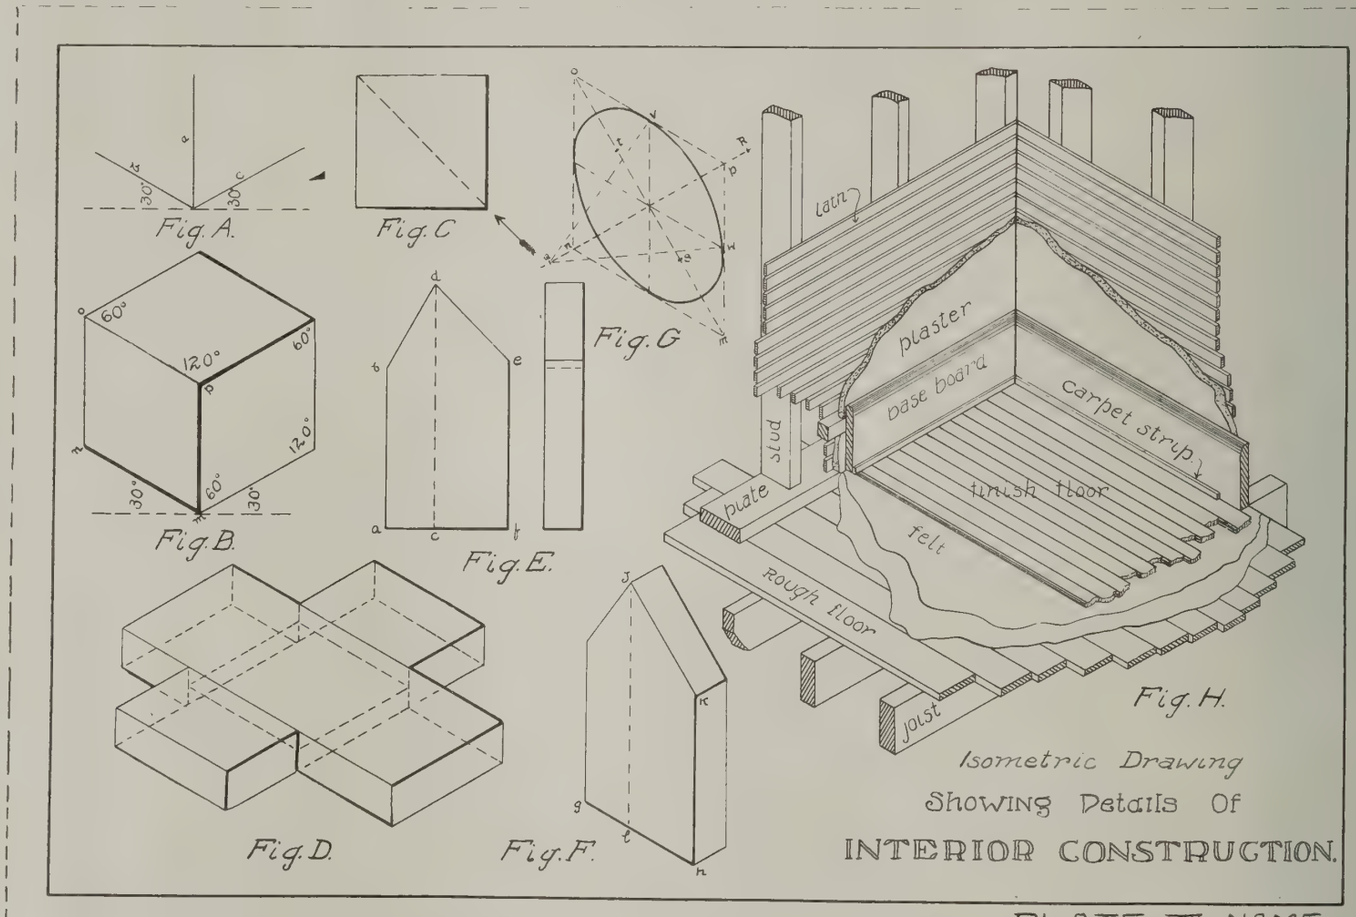

PLATE VIII. NAME.

A simple example of these principles is given in Fig. D, where we have the isometric view of a half-lap joint.

Non-isometric lines are those which cannot be drawn parallel to the isometric axes. This classification includes lines that are neither vertical nor horizontal and also curves.

In Fig. E we have an object, two of whose edges *bd* and *ed*, are oblique. In the isometric view they cannot be parallel to the isometric axes, hence we have to locate them by co-ordinates. To do this, draw the vertical dotted line *cd*. Start Fig. E by drawing the base *gh* equal to *af*. Draw the verticals *gi* and *hk* equal respectively to *ab* and *fe*. Lay off *gl* equal to *ac* and draw the dotted vertical *lj* equal to *cd*. Connect *i* and *j* and *k* and *j*, and complete the figure by drawing in the side. In a way similar to this, any oblique lines can be drawn in isometric.

In an isometric drawing a circle takes the form of an ellipse. It is projected on one of the planes of Fig. B, in this case we have taken *m. n, o, p*. Theellipse is drawn from four centers, *q, r, s, t.*

To locate centers *s* and *t*, lay off *ms* and *ot* equal to *ob*. To locate centers *q* and *r*, lay off *qw* and *qv* equal to *mp*. This locates center *q*. Lay off *rx* equal to *qx* and the fourth center is found. The ellipse drawn is not tangent to the sides, but the error is very slight and can hardly be detected.

Fig. H gives a practical application of the principles and should be drawn with extreme care by the student. It gives the interior details of the framing and finish of a house, and is the sort of work that draftsmen are sometimes called upon to do.

In this plate no dimensions are given for the student to work by, but he should make his figures large enough to balance the spacing on the plate.

PLATE IX.—OBLIQUE PROJECTION.

The oblique axes, as observed in Fig. A, are vertical, horizontal and at an angle of 45 degrees. This angle may be made enther 30, 45 or 60 degrees, but the 45 degree line gives the better appearance to the drawing. If the edges of the object to be drawn are at right angles to each other, they are drawn in parallel to the oblique axes, the same as in isometric drawing, and in their true lengths.

Fig. B is the oblique drawing of a cube, and is constructed under the above principles. The shade lines have the same general position as in isometric drawing, the top, front and left-hand edges being light.

In Fig. C is illustrated one of the principle advantages of oblique over isometric drawing. It represents a hollow cylinder and it is observed that the faces are true circles, whereas in isometric they are ellipses.

The next fourteen figures represent work that draftsmen are very often called upon to perform. They show sections of mouldings, etc., that are sometimes given as details on a set of house plans. Whenever they are so given, they are drawn in full size, so it would be well for the student to draw them in full size. Two sheets will be needed to do this properly, from Fig. A through Fig. K on one sheet and the balance on another. In the drawing here given no particular scale has been used. Shade lines have also been omitted from the details, this being left for the student to do. The parallel lines close together are known as section lines, and are used to show that the piece is viewed from the end. This end face is drawn in full size with vertical and horizontal lines, and then the lines at 45 degrees are added to it, giving it the appearance of having length.

The pieces represented by the figures are:

Fig. D. Parting stop.
Fig. E. Quarter round.
Fig. F. Quarter cove.
Fig. G. Picture moulding.
Fig. H. Window and door stop.
Fig. I. Casing.
Fig. K. Crown moulding.

Fig. M. Head casing with cap and fillet.
Fig. N. Corner board with quarter round.
Fig. O. Window stool with apron.
Fig. P. Bed mould.
Fig. Q. Water table.

(To be continued.)

TELEPHONES IN THE UNITED STATES

THE United States leads the world in its intelligent use of the telephone. It has eight instruments to every 100 inhabitants, and no other country uses half so many. Herbert N. Casson, in the Electrical Review and Western Electrician, says that Germany has as many telephones as the State of New York, and Great Britain as many as the State of Ohio. Chicago has more than London, and Boston twice as many as Paris. In the whole of Europe, with her twenty nations, there are but one-third as many telephones as in the United States. In proportion to her population, Europe has but one-thirteenth as many.

The average European family sends three telegrams a year, and three letters and one telephone message a week, while the average American family sends five telegrams a year, and seven letters and eleven telephone messages a week. The United States, owns 6 per cent of the earth, and is 5 per cent of the human race, has 70 per cent of the telephones in use in the world.

OUR READERS' PAGES

[The Editor does not hold himself responsible for the opinion of correspondents. Short, crisp letters will be appreciated. To insure publication, the name and address of the writer must accompany the communication, not necessarily for publication. Sketches of work or methods will receive our earnest attention. These columns are open to our readers at all times without cnarge, and any questions or experiences will be given proper space.—Editor.]

ANSWERS

CLEANING OFF CEMENT.

From H. W. C., Detroit, Mich.

In answer to G. W., Buffalo, N. Y. Cement may be cleaned off a rough faced brick by scraping or friction—not otherwise, without the use of muriatic acid.

A PITCH OR TAR ROOF.

From "J. P. C.," Clinton, Ill.

In reply to "C. G. W." of Rome, N. Y.—If he will take six gallons of pitch or coal tar, and mix with it one and one-half gallons of gasoline, and stir up good, then apply, and properly sand, he will have a cheap, durable, and effective roof. This amount will cover about two squares.

PAINTING SHINGLES.

From "B. O. T.," Spokane, Wash.

In answer to Michael J., Green Bay, Wis., in regard to painting shingle roofs, in this state where we have a wet and dry season, I have had some repair jobs on cedar shingle roofs that have been painted. I find that at the end of each shingle the paint line is just a little higher than the shingle under, which has a tendency to hold the water that drains between the shingles, and as there is no way for the water to pass over this line, it therefore goes into the wood and stains can be seen on the under side of the shingle, unless the roof be very steep. Many of our architects specify stain, using the common creosote stain, but the shingles are dipped before laying, which gives the stain an even surface for more than two-thirds the length, and makes a lasting and perfect exposed surface. I have found old roofs not painted, made of cedar shingles that were perfectly sound and waterproof.

NAILS FOR COPPER ROOF.

From "A. S.," Milford, Conn.

Answering H. R., New Orleans, La., I may say from long experience that I have found galvanic action has no direct bad effect on copper, but would have on the nails that hold the copper. As a matter of fact, the union of zinc and iron in galvanized nails, is not sufficiently strong to withstand the unequal expansion of the two metals, and the zinc coating gradually peels off, which exposes the iron to a more rapid corrosion, by the chemical action of the electro change produced. Herein lies the dangerous influence of the galvanic action on the zinc coating of the nails. When copper is used for roofing or for similar purposes, only copper nails should be used.

ARCHITECTURAL DRAWING.

From "M. C.," Spokane, Wash.

If "S. S." of Lagrange, Ind., is a regular reader of THE NATIONAL BUILDER, he must have read a whole lot of good things—instructive ones, regarding "Architectural Drawing." There is a series of excellent drawing lessons which are ample in themselves to show how to draw for ordinary work. These articles are quite clear and easy to understand. If S. S. subscribed for another or two building papers, or purchased a few of Hodgson's books on drawing and architecture, the investment would bring him in good results. Knowledge, like everything else, can not be obtained without an expenditure of either money or experience. I have always found it so and guess everybody else has too. "There is no royal road to either learning or wealth."

DRAFTSMANSHIP.

From "J. A. B.," Lake Magantic.

If S. S., Lagrange, Ind., would take a series of lessons from F. B. Dobe, who advertises in your paper, or take a course in either "The American Correspondence School of Chicago," or "The International School of Correspondence," Scranton, Pa., he will soon learn to become a good draftsman. This is what I did, and I am considered a pretty fair draftsman.

BOARD COVERING.

From "M. E. M.," Topeka, Kans.

I have taken your really good paper for years and derived much benefit from it. In answer to "J. B. R.," Palestine, Texas, I may say I have used "Beaver Board," in damp, as well as dry places, and it does equally well in either case. For damp, it requires closer nailing than in drier places, and must be drawn as tight as possible. I have never had any complaint about it.

QUESTIONS

CURING WARPED DOORS.

From "Aug. G. S.," Centralia, Ill.

Having been a reader of THE NATIONAL BUILDER, for a number of years, would like to ask if any of the readers could tell me how to straighten out doors that have drawn in from the stop, or twisted? The door in question is an inside door 2½ ft. x 7½ ft. 1⅜ in. Warp caused by a heating stove standing near. Had it in press for several days, but of no avail. Would be thankful for any reliable and inexpensive remedy?

COVERING UP A DOOR OPENING.

From "H. J. E.," Lackawanna, N. Y.

I would like to have some of the readers of our journal tell me the best way to put a door, or perhaps a roller curtain, in a grille opening between parlor and front stair hall? Size of opening 3 ft. 6 in. x 6 ft. 10 in., without grille. There are times when we would like this opening closed, and a door of this size would be a nuisance.

From "Slivers," Flushing, N. Y.

Will some "Chip," who knows all about it, publish in this department the proper figures to use on the "square" for obtaining the "side cuts" to fit against a "hip rafter" having unequal pitched roof; also how to find the lengths and cuts or bevels of common rafters without going to the trouble of making a draft? Suggestions of any kind along these lines will be appreciated very much.

REFRIGERATOR OF BRICK.

From "J. F. E.," McKenny, Va.

I want to build a small refrigerator of brick, 3x6x6 feet, and would like some advice on the matter. I would like to know more particularly how to prevent the walls from sweating on the inside? Any information on this subject will be thankfully received.

BEAM CEILINGS AND PANEL WORK.

From "John L. P.," Waupon, Wis.

I should be very much gratified if you would occasionally ask some of your subscribers to send you for publication some design for wood beam and panel ceilings, dining-room furniture, buffets, hall seats, settees, and other "odds and ends," that a good "carpenter" should be able to make for his own home?

CURVED CONCRETE WORK.

From "W. H. P.," Miltonvalle, Kans.

Would like very much if some reader would explain how to prepare the forms for making cement circular steps and other curved concrete work?

ROOFS AND STAIRS.

From "J. A. B.," Lake Megantic.

I am obliged for the nice and instructive answers to my questions. I am a constant subscriber, and have received a great deal of good from the paper. Just now I am studying roof and stairs,

and would like to see something more on these subjects, for I am sure others, as well as myself would appreciate such instructions.

DEADENING WALLS.

From "Fred T.," Flint, Mich.

I am an old reader of your "good paper," and go to you for advice. I wish to "deaden" a wall in a double house. We have now two partitions, with a space of two inches between the studding, leaving a hollow of that much, with deadening felt between, but it does not work well, as sound passes through. Will some reader help me out or explain and oblige?

ESTIMATING.

From "H. H. H.," Roanoke, Va.

For years I have bought all my books from you, and have been a regular subscriber to your paper for a long time, and have learned many good things from its pages, and expect to gather much more information from it, as time progresses. Just now I would like a few pointers on the method employed for estimating excavating, and if you, or some kind reader would work out the following details for me, I think I would be able to work similar matter out without outside help?

Excavating—For a cellar: 10 ft. deep, 30 ft. wide, 50 ft. long. Brick wall for a building 30 ft. wide, 50 ft. long, 19 ft. high. Weather-board for frame house 30 ft. wide, 50 ft. long, 19 ft. high.

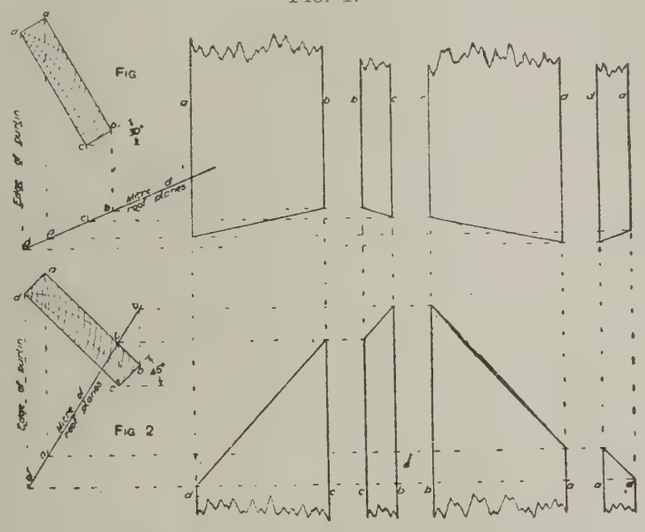
To estimate flooring: 30 ft. wide, 50 ft. long.

After this is done, I can see a clear way with this little aid, and a little more of your help, and I thank you in advance.

H. H. H.

DEADENING FLOORS.

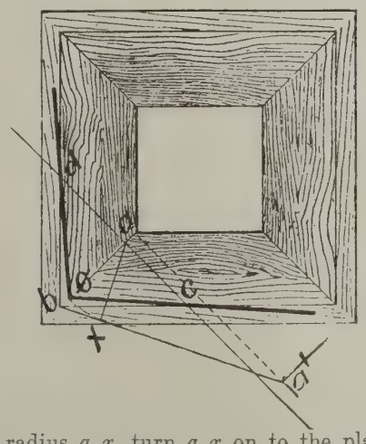
From "H. G. M.," West Homestead, Pa.



I would be thankful to any reader who would kindly describe an effective method of deadening floors in a three-story apartment building to be constructed of brick? Any suggestions will be appreciated.

OUR PRACTICAL COLUMN

BEVELS FOR HIPS AND PURLINS.



The bevels for the purlin shown in the Fig. mentioned are for an ordinary 45-degrees mitre. The angles of the cuts given by this method are as follows: Fig. 1 shows the bevels for the purlin marked on diagram. Fig. 1, p. 128, and Fig. 2 shows the bevels for the purlin at hipped end that meets the latter.

FIG. 1.

BEVELS FOR MITREING HOPPERS.

The shaded portion shows the plan of the hopper, *a b* being the plan of the mitre. At any point in the plan draw *c a* at right angles to it. Through the same point draw a line at right angles to the true length of the mitre, which is shown at *b* a^1. With *a*

as center, and radius *a x*, turn *a x* on to the plan of the mitre. Join the newly determined point to *c* and *d*, and the contained angle θ is the true angle at the corner of the hopper, and half this angle will be the mitre.

ROOFING SLATE

Table of Sizes and Number of Slates in One Square (100 Square Feet) of Roof

Size in Inches	No. of Slate in a Square	Size in Inches	No. of Slate in a Square	Size in Inches	No. of Slate in a Square	Size in Inches	No. of Slate in a Square
6x12	533	9x14	291	10x18	192	11x22	137
7x12	457	10x14	261	11x18	174	12x22	126
8x12	400	12x14	218	12x18	160	14x22	108
9x12	355	8x16	277	14x18	137	12x24	114
10x12	320	9x16	246	10x20	169	14x24	98
12x12	266	10x16	221	11x20	154	16x24	86
7x14	374	12x16	185	12x20	141	14x26	89
8x14	327	9x18	213	14x20	121	16x26	78

A square of slate is roughly estimated at from 600 to 700 pounds per square, varying according to the thickness of the different makes.

Weight Per Square Foot

Thickness	1/8	3/16	1/4	3/8	1/2	5/8	3/4	1
Weight	1.81	2.71	3.62	5.43	7.25	9.06	10.87	14.5 lbs.

Weight per cubic foot, 174 pounds

On account of laps, it takes an average of about 2½ square feet of slate to make one of slating.

PINE SHINGLES

Number and Weight of Pine Shingles to Cover One Square (100 Square Feet) of Roof.

Table based on 4 inch width. For other widths multiply given number by 4 and divide by the width.

Number of inches exposed to weather.	4	4½	5	5½	6
Number of shingles per square of roof.	900	800	720	655	600
Weight in pounds of shingles on one square of roof.	216	192	173	157	14

The number of shingles per square is for common gable roofs. For hip roofs add 5% to these figures. The weights per square are based on the number per square. Shingles come 250 to the bundle. 4-inch shingles weigh 240 pounds to 1,000.

SKYLIGHT GLASS

The Weights of Various Sizes and Thicknesses of Fluted or Plate Glass Required For One Square (100 Square Feet) of Roof

Dimensions in inches	12 x 48	15 x 60	20 x 100	94 x 156
Thicknesses in inches	3/16	1/4	3/8	1/2
Area in square feet	3.997	6.246	13.880	101.768
Weight in pounds per square of roof	250	350	500	700

No allowance is made for lap in above table.

NUMBER BRICK REQUIRED TO CONSTRUCT ANY BUILDING

(Reckoning 7 Bricks to Each Superficial Foot)

Superficial Feet of Wall	Number of Bricks to Thickness of				
	4 inch	8 inch	12 inch	16 inch	20 inch
1	7	15	23	30	38
2	15	30	45	60	75
3	23	45	68	90	113
4	30	60	90	120	150
5	38	75	113	150	188
6	45	90	135	180	225
7	53	105	158	210	263
8	60	120	180	240	300
9	68	135	203	270	338
10	75	150	225	300	375
20	150	300	450	600	750
30	225	450	675	900	1,125
40	300	600	900	1,200	1,500
50	375	750	1,125	1,500	1,875
60	450	900	1,350	1,800	2,250
70	525	1,050	1,575	2,100	2,625
80	600	1,200	1,800	2,400	3,000
90	675	1,650	2,025	2,700	3,375
100	750	1,500	2,250	3,000	3,750

HIP RAFTERS FOR CURVED MANSARD ROOFS.

Draw an elevation, say an inch and a half to the foot, of the side rib, perpendicular stud and outlooker. Strike the concave of the side rib, as shown by A B in the accompanying sketch. (Fig. 1.)

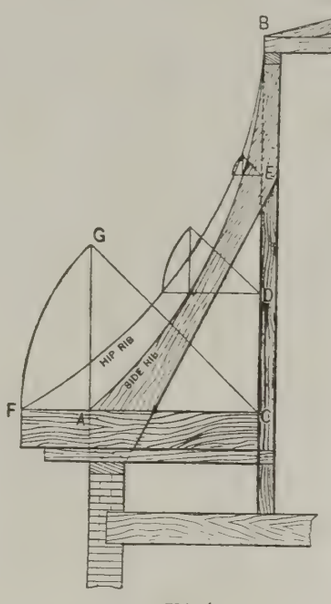


FIG. 1

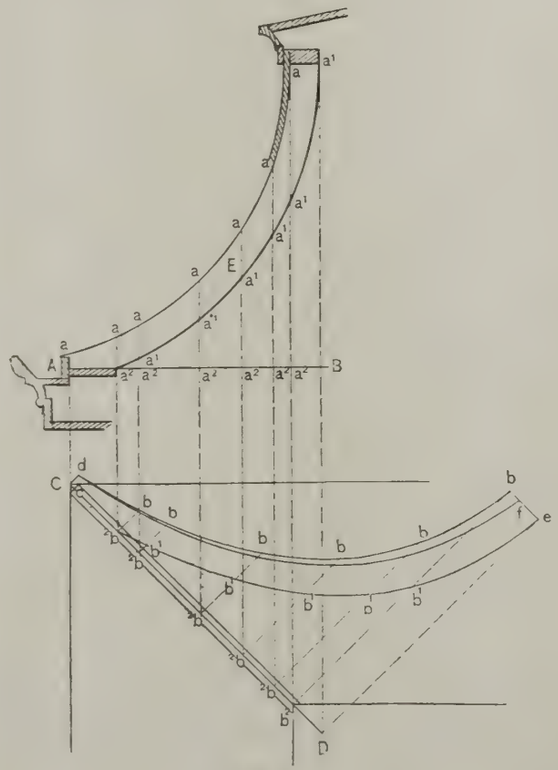
Divide the line of perpendicular stud B C into any number of equal spaces—in this case three, as indicated by E D C. From each of the points thus obtained and at right angles to B C, draw lines indefinitely, as shown by C F, cutting B A as indicated. From the point of intersection of each of these lines erect a perpendicular, as shown by A G, making A G equal to A C. Connect G and C; then from C as center, with C G as radius, describe arcs as indicated by G, just intersecting C F in the point F; then F will be the point in the curve of the hip rib on the line F C. In like manner obtain other points upon the several division lines set off from B C. Then a line traced through the points thus obtained, as indicated by B F, will be the curve of the hip rib.

ANOTHER METHOD.

Let A B, Fig. 2, be the seat of the given rib E, standing square with the building. Let C D in the plan be the seat of the angle rib. By laying off the thickness of the angle rib on the plan, as shown by the lines parallel to C D, operations to be explained further on will be more clearly understood. From any point on the top edge of the given rib E, as indicated by $a\,a$, etc., draw lines perpendicular to A B, intersecting the center line of the seat of the angle rib, as indicated by C b^2 b^2 b^2 and D, from which points erect lines perpendicular to C D, producing them indefinitely. Upon these lines erect perpendicularly to the seat of the angle rib C D, set off distances corresponding to the height of similar points measured upon like lines from A B to the edge of the given rib E, or, in other words, make D e equal B a^1, and each of the several spaces b^2 b equal to a^2 a. Through the points b b b, etc., trace the form of the upper edge of the angle rib in like manner. By setting off on the lines perpendicular to C D spaces equal to the distance from A B to the under side of the given rib E, as indicated by the points b^1 b^1 b^1, etc., the under line of the hip rib may be developed. Of course, it is not necessary to be so particular about the lower edge in a case of this kind, but the two edges may be obtained in one operation if desired.



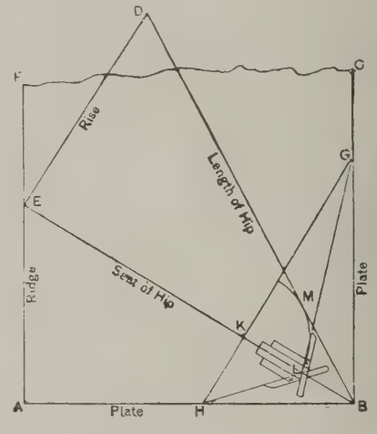


FIG. 2.

To back the angle rib, slide one rib on top of the other from C to c at the root, and from b to f at the top, making the space from b to f equal to C c, and mark the line a f. Reverse the ribs, and mark the other side in the same manner; then trace each side from the lines thus obtained to the center line on the edge of the rib; thus will give the required backing.

A HIP ROOF.

In the accompanying sketch let A B C represent the plates of a roof. Let A F represent the ridge of a roof. Let B E represent the seat of hip rafter, E D the rise of roof, and consequently D B the length of hip rafter. Draw G H at right angles

to B E; then, with K as center, find the radius of a circle that will touch the line B D, as shown at M. Make K L equal to that radius, and join L G and L H; then L G will be one and K L H will be the other bevel for backing the hip.

SCREWS IN SOFT WOOD.

The hinges of boxes, especially very small ones, frequently break loose on account of the small size of the screw, which easily pulls out of the wood. Consequently it is often very difficult to repair an article of this kind. Even experienced cabinet makers and others who work upon fancy articles find difficulty in making the screws hold. If the screw hole is not too badly broken out, the hinge may be taken off entirely, some thick glue made, and the hole filled with it. The screws are then immersed in the glue, the hinge put in place, and the screws driven home as quickly as possible. When the glue hardens, the screw will be held fast even in soft wood. If the screw hole is deep and glue is not at hand, an easier way is to heat the screw until it is hot enough to melt rosin. A little rosin is then put on so as to fill up the threads, and the screw is then quickly put into the hole and driven home. The rosin melting upon the screw, and being forced into the wood, makes a very strong and durable cement, which holds the screw firmly in its place. In this way fancy articles can easily be repaired, and often will be stronger than when they left the manufacturer's hands. These directions are especially applicable to screws which are driven into pine and softer woods.

BOOK NOTICES

(Notice.—All books noticed in these columns may be obtained from this office at publishers' prices. All postage or express prepaid. Money and address must accompany all orders.)

GARAGES AND MOTOR BOAT-HOUSES, GARAGE CONSTRUCTION AND GARAGE EQUIPMENT.—Comprising a large number of designs for both private and commercial builders. Showing the latest ideas in their planning and construction. For the country, suburban towns and cities, also motor-boat houses. The designs are contributed by well-known architects from different sections of the United States, compiled and edited by Wm. Philips Comstock, editor of the Architects' and Builders' Magazine. Bound in cloth and art paper. 119 pp., size 7½x10½. Price, $2.00.

The author states in his introductory remarks that "The garage, as the most modern of structures, presents a problem to architects and draughtsmen, with which they have had less experience than with any other form of building. In addition, the precedents which they may follow are not so clearly defined, nor so inviolable, as in the case with other buildings. Yet, this style of structure possesses requirements of a distinctive character, and usually of extreme simplicity, and in order to meet these requirements satisfactorily, all that is really necessary is a liberal application of the laws of common sense."

The work over 128 plans and elevations of well-designed garages for both motors and boats. These are in wood, brick, stone, concrete and half-timber buildings, and are designed with the intention of being convenient and complete. The book is decidedly the best exhibit of garages that has yet appeared, and will doubtless prove useful and instructive to every person who either designs or builds this kind of structure. The fact of this style of building being a departure from the ordinary, will render the book of great assistance to those who have never tried their hand on this line of architecture; and for those who have had experience, there are many things between its covers that will prove suggestive and of value.

DISTINCTIVE HOMES OF MODERATE COST.—Being a collection of country and suburban homes in good taste, with some valuable suggestions for the home builder. Compiled and edited by Henry H. Saylor. Bound in boards and cloth—flat. About 10x13 inches. Over 172 pp., with several hundred illustrations of exteriors and interior finishings. Published by McBride, Winston & Co., New York.

This is a very convenient work for those who are about to build or about to make changes in their residences, as it deals largely with construction and decoration of all kinds—including style of building, details of construction, roofing, porches, windows, doors, fireplaces, mantels, including an essay on heating systems and water supplies, installation, maintenance, and cost of steam heating, hot air and other methods. A long description of lighting by power and independent plant, electric fixtures of all sorts. Another chapter deals with built-in conveniences, bookcases, cabinets, wainscoting and built-in furniture. Floor and floor coverings—including furnishings, carpets of various sorts. Rugs—with a description as to their characters, styles and costs.

Various methods of furnishing living rooms, dining rooms, parlors, libraries, bed rooms, and dens. There is a chapter on portieres, window, wall and other draperies; ornaments, picture hanging, distribution and places for bric-a-brac, with advice as to the use and application of ornament.

Part Two.—This part shows and describes garages—a number of high-class residences, gardeners' cottages, some old-fashioned buildings and a number of excellent examples of tasteful and desirable structures. The work is an excellent assistant for the home where there is any intention to build, enlarge, or improve, and many useful hints can be gleaned from it for laying out lawns, landscape gardens, and outdoor decoration of any kind.

A POPULAR HAND BOOK FOR CEMENT AND CONCRETE USERS.—A comprehensive and popular treatise of the principles involved and methods employed in the design and construction of modern concrete work. A standard reference book, covering the uses of plain and reinforced concrete. Everything of value to the concrete user is given, including kinds of cement employed in construction, concrete architecture, inspection and testing, waterproofing, coloring and painting, rules, tables, working and cost data. By Myron H. Lewis, C. E., author of "Examinations of Civil Engineers," "Waterproofing of Concrete," etc., etc., and Albert H. Chandler, C. E., author of "Materials Employed in Construction," etc., published by The Norman W. Henley Publishing Co., New York. 430 pp. Over 120 illustrations and diagrams. Cloth. Price, prepaid, $2.50.

The title and introduction as shown in the foregoing give a fair idea of what this book contains, but it is impossible in an announcement of this kind to convey to the reader an idea of the real practical benefits that may be obtained from its contents. As the author states in his preface, "To compile material, all of which shall possess some definite value; to explain the principles and methods in concise and non-technical language; to describe the variation of cost for different kinds of concrete work; to give the reader a handbook that will prove interesting, as well as useful; to bring home the great economic and artistic qualities of concrete as a building material; and finally to help in producing a better, higher grade of concrete work. These are the criteria which have helped to shape the characters of this book, criteria difficult to satisfy and almost impossible of complete attainment."

After close examination of the contents of this book we are convinced that the authors have examined critically every subject pertaining to the use of cement and concrete and have given to the building trades a mass of the most useful of practical knowledge obtainable. Their discrimination from our point of view seems to be faultless—as nothing is presented that is not of value and much matter that might have been introduced, but which to a large extent, would have been repetition, has been avoided; and although the book is somewhat bulky, due to comprehensive references, it does not carry on its pages anything that may be considered useless. It has been our fortune—or misfortune—in our capacity as editor of a building journal, to wade through many a big tome of technical literature, but we do not know of many works now in the market where the true objects of the writings have been so easily reached, and made understandable, with less effort than in the work before us. This is quite an advantage to the busy man, whose time is taken up largely with his business affairs.

Nearly every phase in concrete and cement work is discussed, and methods, proper proportions, and correct usage are exhibited with a minimum of technical explanations, and yet, the language is clear and ample and conveys directly to the mind the author's intention.

The work is printed in good readable type, on strong book paper, and is well and durably bound, and will, we are sure, find its way to the book shelves of every contractor, engineer and architect in the land.

HOW TO READ PLANS. A simple practical explanation of the meaning of various lines, marks, symbols and devices used on Architectural working drawings, so that they can be correctly followed by the workman.

By Charles G. Peker, Co-Author of "Easy Lessons in Mechanical Drawings," etc.

Fully illustrated, Second Edition, revised and enlarged. Published by the Industrial Book Company, New York—1911.

Well bound in cloth. Price, 50 cents.

This is a very useful little work, and particularly so for students and young draftsmen, as it describes the scales used, and all the peculiar marks and symbols made use of by draftsmen. It contains over 100 pages and is illustrated with over 80 well defined illustrations. and some lessons in drawing and perspective. There being a complete set of architect's plans for a six-room frame cottage. The work is simple, low priced, instructive, and effective. Sent post-paid to any address on receipt of price.

VENEER MATERIAL

WASHINGTON, D. C., February 20, 1911.—The outlay for veneer material, both domestic and imported woods, during the calendar year 1909 was $8,977,516, as against $7,891,431 in 1908 and $6,436,237 in 1907. The number of establishments engaged in the manufacture of veneers during 1909 was 637, an increase of 235 and 267 over the number reporting in 1908 and 1909, respectively.

This information appears in a preliminary comparative report covering 1909, 1908, and 1907, which was transmitted today to Census Director Durand by Chief Statistician William M. Steuart, under whose supervision it was prepared by J. E. Whelchel, expert special agent of the division of manufactures. In cooperation with the Forest Service of the Department of Agriculture the Bureau of the Census annually collects and publishes statistics pertaining to the group of lumber and timber industries.

The rapid rate at which this industry has grown during recent years continued through 1909, the showing for that year disclosing not only a substantial increase in the number of mills, but also the fact that in point of geographical distribution the industry has extended from 30 states in 1907 to 34 states in 1909.

States Leading in the Industry.

Although veneer manufacturing was engaged in during 1909 in practically every state in which lumber timber occurs in commercial quantity, nearly three-fourths of the material consumed during the year was reported from the 11 states of Illinois, Michigan, Florida, Indiana, Tennessee, Missouri, Arkansas, New York, Virginia, North Carolina, and Kentucky, ranking in point of quantity consumed in the order named. Furthermore, of these states, the group composed of Illinois, Indiana, Florida, and Michigan alone contributed nearly one-third of the total, showing that the industry is still to some extent localized.

A point of interest in this connection is the fact that although the three states, New York, Illinois and Indiana, reported but 20.9 per cent of the total quantity of material consumed during 1909, their contribution formed 42.8 per cent of the total cost of all veneer material consumed during that year. This showing is due directly to the fact that the manufacture of veneers from imported and high-priced cabinet woods, especially mahogany, is to a large extent centered in these three states, Illinois alone reporting more than half of the mahogany consumed during 1909 and New York following with nearly one-third.

New York led in the consumption of both Spanish cedar and Circassian walnut, reporting more than three-fifths of the total of each of these species.

For many years the manufacture of veneers was mainly from the imported cabinet woods and to a limited extent from such domestic woods as walnut, oak, and bird's-eye maple. The extension of the industry has been more in the nature of the development of a new industry, the large increase in the total annual consumption of material being made up chiefly of domestic woods which are converted into veneer stock, from which are made baskets, berry crates, packing cases of various kinds, furniture, material for laminated lumber, barrels, etc. It is this branch of the industry which is widely distributed and in which the growth is most rapid.

LATEST LEGAL DECISIONS

A contractor with a city to make alterations in a public schoolhouse let a contract to a subcontractor for a part of the work, and the subcontractor contracted with a material man to furnish part of the material. The subcontractor failed to perform his contract, and the contractor paid a portion of the claim of the materialman, and, after the subcontractor failed, let the contract to another subcontractor. The amount paid the last subcontractor and the amount paid to the materialman exceeded the amount which the contractor agreed to pay the first subcontractor. Held, that the materialman had no lien upon money owed by the city to the contractor.—Meurer v. Kilgus, 75 A. (N. J.) 899.

A building contract provided that, should the contractor be delayed in the completion of the work by the act or default of the owner, architect, or other contractor, then the time fixed for the completion of the work shall be extended to a period equivalent to the time lost by reason of such causes, which extended period shall be determined by the architect; no allowance to be made unless a claim is presented in writing to the architect within 48 hours of the occurrence of such delay. No written claims were made to the architect, and no allowances of time were made by the architect. Held, that parol evidence that the architect had promised the contractor that he would take care of it on final payment was inadmissible in an action against the builder.—Van Buskirk v. Board of Education of Passaic Tp., Morris County, 75 A. (N. J.) 909.

A building contract provided that the entire building should be completed by the 15th day of September, 1908, providing, however, that the owner remove the present building from the proposed site before the 15th of May, 1908. The contract further provided that the contractor should pay to the owner the sum of $25 per day as liquidated damages for each and every day's delay that the work shall remain unfinished after the date agreed upon for the completion of the same. The contract provided that in case of delay in completing the work caused by any act or default of the owner, or other contractor, the time for completion should be extended for a period equivalent to the time lost; such period to be fixed by the architect upon written demand of the contractor. There was no extension of time by the architect. The owner removed the old building entirely from the proposed site on May 17th. The building was not completed until November 14th. Held, that the contractor was liable for liquidated damages from September 17th to the date of the building's completion.—Van Buskirk v. Board of Education of Passaic Tp., Morris County, 75 A. (N. J.) 909.

In an action on a contractor's bond for breach of a contract to erect a house for plaintiff, whereby plaintiff was compelled to pay certain lien claims against the property, findings in the lien case, to which plaintiff was a party, that certain claims for labor and material were for work not embraced in the contract, will, in the absence of the record in the lien suit, be presumed to have been within the issues in that suit.—Sheard v. United States Fidelity & Guaranty Co., 107 P. (Wash.) 1024.

To determine whether the limitation of time to sue in an indemnity bond given by a contractor is reasonable, the bond, the contract, and the facts of the particular case must be considered, and where a guaranty company gave a bond to indemnify the plaintiff from any pecuniary loss from the contractor's breach of a contract to furnish material and labor and erect a house for him, and providing that no suit could be instituted thereon later than February 22, 1906, the limitation was unreasonable where the contract was not completed until June, 1906, the liens were not filed against the property until after February 22, 1906, and the judgments in action thereon not rendered until June, 1908, since the obligation of the guaranty company was to indemnify against pecuniary loss, which occurred only when the liens were established against the property, which was long after the time to sue fixed in the bond.—Sheard v. United States Fidelity & Guaranty Co., 107 P. (Wash.) 1024.

A tenant cannot, without the authority, expressed or implied, of the landlord, charge the leased premises with a lien for material used in repairing a building thereon.—Cross V. Eyerley, 125 N. W. (Neb.), 1085.

The word "another," as used in Lien Law (Consol. Laws, c. 33) §17, providing that, if the lienor is made a party defendant in an action to enforce another lien, the lien of such defendant is thereby continued, is equivalent to "other."—John A. Philbrick & Bro. v. Ignatz Florio Co-op. Ass'n, 122 N. Y. S. 341.

When more than four months intervene between items of an account for material furnished a mechanic's lien will not attach for the items preceding the hiatus, unless it is made to appear by competent evidence that all the items were furnished pursuant to one contract.—Cross v. Eyerley, 125 N. W. (Neb.) 1085.

Under Employer's Liability Act (Code 1907, §3910) subd. 1, making a master liable for a defect in the ways, works, machinery, and plant, a ladder used in doing the master's work is a part of the "plant," and the master is liable for injuries caused by a defect in it.—Grasselli Chemical Co. v. Davis, 52 So. (Ala.) 35.

Ordinarily, as between a subcontractor and the contractor, who is in control of the general work to be performed, the law places the latter under an obligation to the former to make good all losses consequent upon delays in the progress of the work not attributable to the former.—Norcross v. Wills, 91 N. E. (N. Y.) 803.

A provision in a contract for building a county courthouse for the sum of $37,349 that the contractor should pay the county as liquidated damages $10 for every day the completion of the building was delayed after the contract date of completion was valid as a provision for liquidated damages, and was not a penalty.—Thompson v. St. Charles County, 126 S. W. (Mo.) 1044.

Where the express provisions of a contract between a subcontractor and contractor referred the former to the owner's architects, and offset their delays in furnishing plans by extensions of time for completion, the subcontractor could not enforce a claim against the contractor for damages for such delays of the architect.—Norcross v. Wills, 91 N. E. (N. Y.) 803.

Rev. Codes, §7290, giving any person performing any work on or furnishing any material for any building, structure, mining claim, etc., a lien on the property, provides for a lien in favor of any person bestowing labor on any character of property as such, or by whom material is furnished for the improvement of the property.—McIntyre v. Montana Gold Mountain Mining Co., 108 P. (Mont.) 353.

Under a contract between a subcontractor and contractor stipulation for liquidated damages for delay in the completion by the subcontractor, but, if he was not at fault and the delay was caused by the contractor or the architects, there was to be an extension of time equivalent to the time lost, the contractor was not liable for the default of the architects in furnishing plans.—Norcross v. Wills, 91 N. E. (N. Y.) 803.

Under Lien Law (Consol. Laws, c. 33) §17, providing that, if the lienor is made a party defendant in an action to enforce another lien, the lien of such defendant is thereby continued, the action to foreclose "another lien" which will keep alive a lien filed by a defendant to the action for the foreclosure of a lien created by a lien law, and not an action to foreclose a mortgage, although that in a sense is a lien upon the property.—John A. Philbrick & Bro. v. Ignatz Florio Co-op. Ass'n, 122 N. Y. S. 341.

Where a contract between a subcontractor and contractor provided that the architects were "acting for the purposes of this contract as agents of the owners," a subsequent provision that the architects should furnish the subcontractor further drawings necessary to detail and illustrate the work was not a covenant of the contractor, since, when read in connection with the part quoted, it simply meant that the subcontractor was to look to the architects for the delivery of the drawings.—Norcross v. Wills, 91 N. E. (N. Y.) 803.

A provision in a contract between a subcontractor and contractor that the contractor should "provide all labor and material not included in this contract in such manner as not to delay the material progress of the work" referred to what the contractor had undertaken to do, or furnish, for the owner, aside from the subcontractor's part of the work, and was an agreement by the contractor that the rest of the work should be proceeded with, so far as he was in control, without any delay which would interfere with the subcontractor's performance.—Norcross v. Wills, 91 N. E. (N. Y.) 803.

PATENTS.

The following list of recent patents and trademarks relating to building interests is especially reported for THE NATIONAL BUILDER by Wm. G. Henderson, solicitor of American and foreign patents and trademarks, Norris building, 501 F street, Washington, D. C. A copy of any of the United States patents will be furnished by him for 25 cents.

980,397. Window refrigerator. Thos. W. Barry, Chicago, Ill.

980,406. Mandrel for reeling ready-roofing fabrics. B. G. Casler, assignor ½ to F. W. Ritter, Jr., Washington, D. C.

980,229. Locking mechanism for emergency exit-doors. C. J. Ericson, Salt Lake City, Utah.

980,414. Reinforcing device for concrete. Chas. A. Hanson, Chicago, Ill.

980,443. Fire-curtain for windows. A. Shuman, Philadelphia, Pa.

981,383. Machine for treating interior woodwork and flooring. Chas. H. Comstock, Indianapolis, Ind.

981,460. Self-closing door or shutter. H. T. Moody, assignor to Victor Mfg. Co., Newburyport, Mass.

981,972. Metallic window-sash. W. F. Bonness, Chicago, Ill.

981,913. Door-releasing device. H. C. Bunday, assignor to M. H. Hart, Akron, Ohio, and R. Many, Chicago, Ill.

981,613. Runway for stair-ways. Ed. V. Carter, Huntington, W. Va.

981,992. Collapsible building. G. Fugman, assignor to A. L. F. Fugman, Cleveland, Ohio.

982,055. Centering for concrete work. L. G. Hallberg, Chicago, Ill.

981,937. Metal door-frame. E. Ohnstrand, Syracuse, assignor Art Metal Construction Co., Jamestown, N. Y.

981,884. Earthquake-proof building. O. Ruhl, Bremen, Germany.

982,759. Floor surfacing machine. A. A. Bagalio, assignor to Andrews Floor Planing and Surfacing Co., New York City.

982,721. Apparatus for heating, cooling and ventilating buildings. E. C. Hodges, Joliet, Ill.

982,522. Removable floor-strip. W. S. Mitchell, San Francisco, Cal.

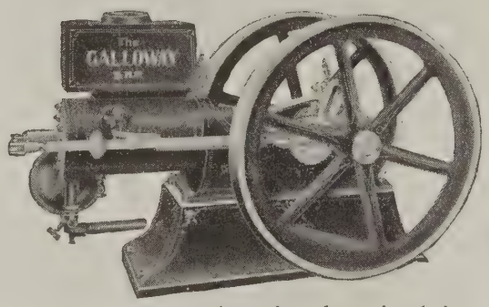
TRADE REVIEW

ATLANTA TOOL GRINDER.

Corundum, as a grinding agent, has the advantage of rapid cutting, small weight and bulk, does not require water for cooling and does not draw the temper of edged tools.

One man with an Atlanta Tool Grinder will do more work, and do it better in less time, than a power grindstone in a shop. Moreover, the grinder is small enough to go in the tool box and can be set up anywhere on the job.

The first requirement of a tool grinder is that it shall be capable of adjustment to do the various work required. The parts should be strongly made to stand the knocks it received on the job, and the bearings should be protected against the fine dust. In the Atlanta Tool Grinder, all these conditions are provided for, it being possible to grind close up to the handle of a knife blade and can be changed in a second to face off the head of a bolt. As the wheel gets smaller, the handle can be quickly adjusted to increase the number of revolutions, keeping the face speed uniform.



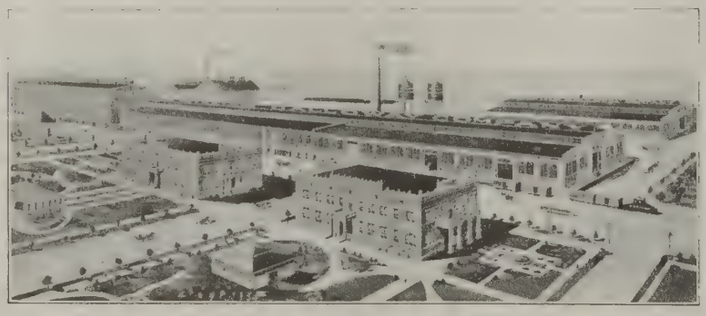
A rather novel construction is in the crank being set at right angles to the surface being ground, the operator standing at the side, where he can watch the progress of the work. This makes it as easy and safe to grind a butcher knife or scythe as a small chisel.

Corundum grinders are rapidly superseding the grindstone, and should be in every tool box, as well as in the shop and on the farm.

The A. A. Woods & Sons Company, Atlanta, Ga., are placing the

The A. A. Woods & Sons Company, Atlanta, Ga., will send you a descriptive folder and full particulars if you mention The National Builder.

THE WILLIAM GALLOWAY GASOLINE ENGINE.



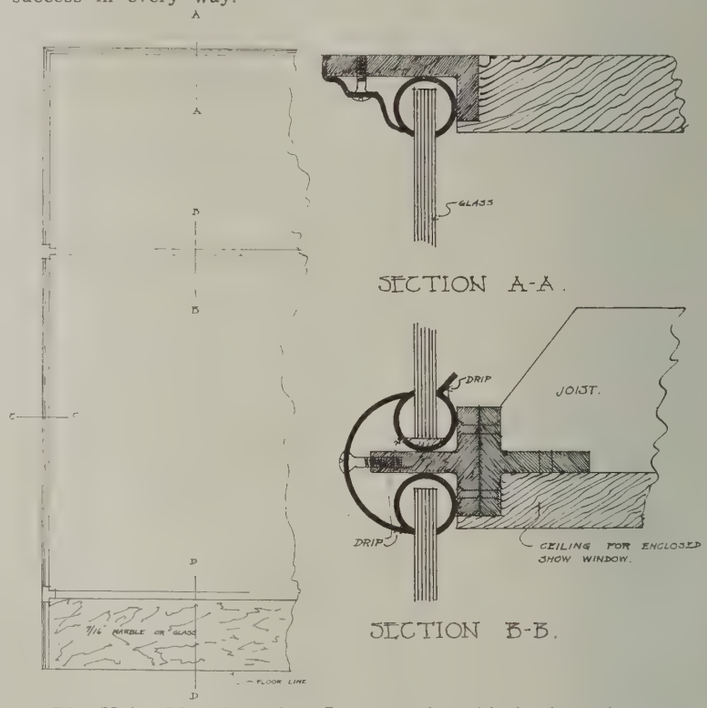
The gasoline engine has done wonders in the building construction field. It has made it possible for the contractor and builder to buy and operate power woodworking machinery and use it so economically that many jobs of millwork formerly turned over to the big mills are now done by them in their own shops.

The gasoline engine, when well designed and made, will do more useful things for the building contractor than any other machine or tool. It can be used to operate saws, planers, lathes, matchers, and concrete mixers, and many contractors are now using the gasoline engine right on the job when the building is going up. The main thing in buying a gasoline engine is to get one that can be relied on under all conditions.

The William Galloway gasoline engine is one of the best known and best liked standard engines. It is so well made and so good in every particular that the manufacturers give the buyers 30 days' free trial.

The William Galloway gasoline engine is the simplest, easiest running and most satisfactory engine selling at any price, and each engine has to stand a very rigid test before shipped.

The William Galloway Company have a decidedly different way of figuring the cost and selling price of their engine, which gives the buyer an unusually good buy. For example, they have set their stakes for making 10,000 gasoline engines for 1911. The price was based on that quantity. In other words, if a contractor or builder were to go to Waterloo and have his money right in his pocket and would ask the price on 10,000 engines, he could not get one cent better price on that number than he could on a single one, as the price of every one is based on the quantity of 10,000.



The William Galloway gasoline engines are manufactured in a factory 250 feet long by 100 feet wide, and which is crammed full of automatic machinery of the very latest type, giving them a capacity of 30 to 50 engines a day. One of the most interesting machines is a tremendous test block that permits the manufacturer to give every engine the most thorough test. Both this engine factory and the Company's new office building are constructed with concrete; made with a patented mold and under the flush concrete system and which gives the outside effect of limestone construction. All this construction work was done in the dead of winter with the thermometer as low as 15 to 30 degrees below zero. This speaks well for the contractors on the job and especially when it is a fact, that not a foot of the work was lost. A new sample room was also built during the winter for the accommodation of visitors and as the William Galloway Company does an immense business in manure spreaders, cream separators, agricultural implements, etc., besides their gasoline engines, many prospective customers and old friends call upon them.

The William Galloway Company issue a catalogue on their gasoline engines which is the finest piece of literature on this subject issued. The catalogue is beautifully illustrated and the reading matter is made up so as to give the prospective buyer an exact idea of how the engines are made; how they are sold and why they are better than any other engine, and why it is possible for the company to sell them on the most liberal terms.

A copy can be had by writing the William Galloway Company, 1695 Galloway, Waterloo, Iowa.

MARBLE OR VITROLITE GLASS FOR A BASE.

The Voltz Manufacturing Co., 1101-1103 S. 8th st., St. Joseph, Mo., call attention to the fact that their system of Universal Sash bars for store fronts is the first and only system wherein it is practical and easy for the small contractor, as well as the large one, to use Marble or Vitrolite glass for a base. With the Voltz system, the marble or glass requires no drilling, wiring or cement and the edges do not have to be polished, beveled or mitred. A sure fit at the corners, where the marble meets at the entrance, is always assured. Besides, the job is so simple that the services of a tile or marble setter is not required, and any carpenter or mechanic can do it with satisfactory results. An examination of the illustration in this article, will show that from the bottom of the plate glass to the top of the marble, there is but 1⅞ inch of metal between them. This makes the finest front ever placed on the market and one that is a success in every way.

The Voltz Manufacturing Co. state that this is the only system that will bring the use of Vitrolite glass for a base back into favor with architects and contractors. The Voltz system does away with any strain on this kind of glass and there is ample room for it to expand or contract. Therefore, there is no breakage.

At the present time it is a hard matter to find any other vitrolite base that has been up a few months where at least one glass is not broken. Architects and contractors have heretofore shied on marble, because of the trouble and risk in setting. The Voltz system is such a great improvement and gives such splendid satisfaction that contractors using it will have an immense advantage over those who do not.

The Voltz Universal Sash Bar now well known among architects and contractors as the one that "Holds with the Grip of Iron, Yet with The Touch of Velvet" is the system of construction to use for holding the most expensive glass store fronts. It makes any angle; it allows for the settling of buildings, and keeps windows from frosting. Voltz Universal Sash Bar will make it possible for the architect and contractor to give the property owner a finer store front, and one that will bring credit to all concerned.

The Voltz Mfg. Co. have a plant at 1101-1103 S. 8th St., St. Joseph, Mo. The high class work which they have done in Missouri and near by states in putting in the Universal sash bar store fronts quickly and safely, without the loss of any expensive glass, is a guarantee that the confidence shown in their system by men who want the best, is not misplaced. Their motto seems to have been, ever since they began the manufacture of the Universal Sash Bar, years ago, not to build up an immense business and sacrifice quality, but rather to go a little slower, and see that every customer

ASBESTOS SHINGLES

Infringement Suit Injunction

THE PRESIDENT OF THE UNITED STATES
to

H. W. JOHNS-MANVILLE COMPANY, and its associates, directors, officers, servants, agents, workmen and employees, GREETING,

WHEREAS, it has been represented to us in our Circuit Court of the United States for the Southern District of New York, that Reissue Letters Patent of the United States No. 12,594, were issued to Ludwig Hatschek in due form of law on the 15th day of January, 1907, and that the Asbestos Shingle, Slate and Sheathing Company is the sole and exclusive owner of the rights to make, use and sell the inventions and improvements or discoveries of said Reissue Letters Patent No. 12,594, and that you, said H. W. Johns-Manville Company have infringed upon said Letters Patent, and upon claims 2, 3, 4, 5 and 7 thereof, which read as follows:

"2. The herein-described process of producing artificial stone plates, consisting of first mixing fibrous material and hydraulic cement in the presence of a great bulk of water, then forming therefrom a series of thin layers of the mixed cement and fibrous material superposed on each other until the required thickness is secured, then pressing the same and allowing the material to set or harden."

"3. The herein-described process of producing artificial stone plates, consisting of first mixing asbestos fibres and hydraulic cement in the presence of a great bulk of water, then forming therefrom a series of thin layers of the mixed cement and asbestos superposed on each other until the required thickness is secured, then pressing the same and allowing the material to set or harden, substantially as set forth."

"4. The herein-described process of producing artificial stone plates, consisting in mixing fibrous material and hydraulic cement in a bulk of water sufficient to render the cement colloidal, then forming therefrom a series of thin layers of the mixed cement and fibrous material superposed on each other until the required thickness is secured, then pressing the same and allowing the material to set or harden."

"5. The herein-described process of producing artificial plates, consisting of first mixing fibrous material and hydraulic cement in the presence of a great bulk of water, to render the cement colloidal, then forming therefrom a series of thin layers of the mixed cement and fibrous material superposed on each other until the required thickness is secured, then pressing the same and allowing the material to set or harden."

"7. A product of the invention herein-before set forth, being a composition containing hydraulic cement which has been rendered colloidal."

and upon the exclusive rights of the Asbestos Shingle, Slate and Sheathing Company thereunder.

NOW, THEREFORE, we do strictly command and enjoin you, the said H. W. JOHNS-MANVILLE COMPANY, your associates, directors, officers, servants, agents, workmen and employees, and each of them, from either directly or indirectly making or causing to be made, using or causing to be used, selling or causing to be sold, or disposing of in any way, or advertising for sale any Imitation Stone Plates, Slabs or Tiles containing or embodying the invention covered by said Reissue Letters Patent of the United States No. 12,594, issued to Ludwig Hatschek, and particularly specified in claims 2, 3, 4, 5 and 7 thereof.

WITNESS THE HONORABLE EDWARD D. WHITE, Chief Justice of the Supreme Court of the United States, at the City of New York, on the 18th day of February, 1911, and in the hundred and thirty-fifth year of the Independence of the United States.

JOHN A. SHIELDS,
Clerk of the Circuit Court.

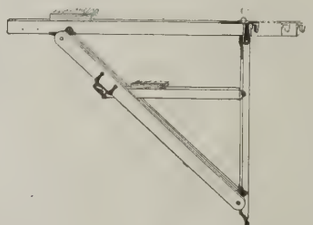
received the right attention, service and materials. Although it would be easy to put cheaper materials in the construction of Universal Sash Bars, and seemingly not affect their quality for some time, the Voltz Mfg. Co. have always used only the best. That this is known and appreciated by architects, contractors and property owners is evidenced by the high class business handled by this company and the constantly increasing demand for Universal Sash Bars.

Full particulars and samples can be had by writing the Voltz Mfg. Co.

FREE RULE GAUGE.

The A. W. Miller Mfg. Co. call attention to their lock mortiser, which has been improved until it is now recognized as one of the greatest time and labor saving mortisers on the market. It is no exaggeration or misstatement when the claim is made that this mortiser will cut an opening in any kind of wood complete in two minutes and any carpenter can do it in that time.

If the builder will have one man bore the two holes and another follow up with the cutter, the job can be done in one minute. There is no other mortiser operated by hand that can beat this time. The A. W. Miller Mfg. Co. have made a study of mortisers for years. All kinds of methods and devices have been tested by them and after years of experimenting the mortiser they now offer is the one worth having, and does the complete job easily in two minutes.



Mr. D. H. Minton of Panama City, Fla., under date of January 30th, 1910, writes as follows: "I have thoroughly tested your lock mortiser and find it is one of the greatest time savers I have ever seen. It is a complete piece of machinery and it does the work perfectly in every respect. I fully recommend it to any man who wants to put his money in something to get it back at once. It is just everything you claim for it. With thanks for the trial and having notified the agent to forward your money, I remain." When a contractor talks this way there must be something to the Miller Lock Mortiser.

The A. W. Miller Mfg. Co. will send a Howell's Rule Gauge, which is worth 15 or 20 cents, free to any of our readers who will give them the names and addresses of a few contractors they may know, and will enclose two cents in postage to cover cost of mailing.

Howell's Rule Gauge is a small, very complete device, and enables a line to be laid off with absolute accuracy and with great speed.

WEBER DOUBLE FOLDING BRACKET.

This bracket has supports for two standing planks, 22 inches apart, which makes it ideal for putting up cornices. By adjusting the top support, it can be used on any kind of a building—frame, brick veneer, or cement block. It is excellent for putting on siding, sheeting, etc., as it can be attached anywhere without injuring the surface. It also fastens into any window frame.

Many Scaffold Brackets seem sound enough when first put into use, but soon work loose and develop "side swing," one of the most annoying and dangerous of defects. Great care has been taken to eliminate any trace of "side swing" in the Weber Double Folding Scaffold Bracket.

Without loosening a single bolt, it can be quickly folded into a piece so small that 12 of them will not take up any more room than the ordinary tool chest. This feature will appeal to every contractor, as it greatly lessens the haul to and from jobs, and saves the time of the workmen.

While the sales on these brackets are just now assuming their greatest proportions, they have been in use ten years. During that time the inventor, a man who has devoted the major part of his life to perfecting such devices, has spared no pains to put them to the most exacting tests. And, while the principle has not been deviated from, many important changes were made, each one for the better.

Contractors and others can purchase these brackets complete, wood parts and all, or the castings separately. By sending a postal to Weber Mfg. Co., 661 71st Ave., West Allis, Wis., complete information and prices on these brackets and on numerous other labor saving devices can be had. The Weber Double Acting Floor Scraper alone is well worth knowing about.

THE QUICK ACTION DOVETAILER.

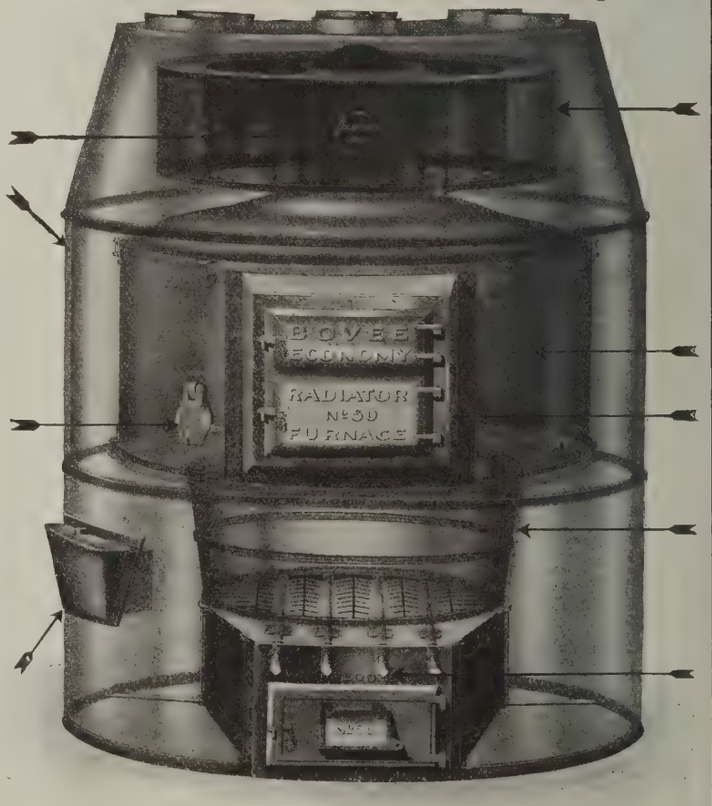
In these times of sharp competition, the man who wins is the one who takes most advantage of time and labor saving tools. The live man does not look upon modern tools as a useless expense but as a necessity. Much time and labor can be saved in making balusters by the use of Archer's "Quick-Action Dovetailer" for wood turning lathes. It is claimed to be the only tool known for making perfectly square shoulder and dove-tail, true to size and taper on balusters. One thousand of these perfect balusters can be turned in ten hours. The price of this tool, $15.00, would be saved on a few jobs. Write for further information or order the tool of the makers, Davis & Archer, 2515 Hanover street, Richmond, Va., mentioning THE NATIONAL BUILDER.

ON THE LEVEL TALKS.

Not so many years ago, some advertisers felt that the more hot air they placed in their advertisement, the better it was, but now many of the best advertisers believe the only way to properly sell their material is to tell the prospective buyer how the article is made and all about it.

The Baker-McMillan Co., Akron, Ohio, is one of these advertisers. If our readers will turn to their first advertisement on Page 73 of the February number and then to Page 69 of the March issue and also to their third talk in this number, they will find that each advertisement is really a short, instructive lecture on the way the Akron Eclipse Levels are manufactured and what they will do.

For instance, talk No. 2 in the March number calls attention to the Silver Lines in the Akron Levels, and states that these silver lines are an exclusive feature of these well-known levels. These silver lines show the exact level at once without any guess work. There is no straining the eyes on a cloudy day or when working in a dark corner to read the Akron Levels and they can be read accurately at a considerable distance.



Akron Levels are made in 33 styles and sizes for every purpose, some with two plumbs and some brass bound and the manufacturers state every workman will find them the best levels for his special purpose but read the advertisement and write for their circulars.

Look for "On the Level" Talks by The Man From Akron every month, and you will surely learn a lot about levels that will be worth knowing.

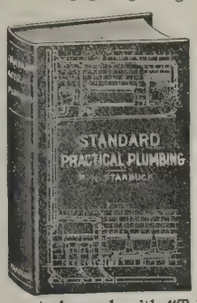
THE BOVEE FURNACE.

The Bovee Grinder & Furnace Works, 60 Eighth St., Waterloo, Iowa, are offering special manufacturers prices on their three run heating plant for residences, and which include the pipe, registers and all fittings. They are also making special prices on their 54-inch furnace designed for stores, churches and schools.

The accompanying illustration gives a good idea of what a Bovee Furnace looks like. The Manufacturers state that their furnaces will save one-third to one-half the fuel and last much longer than

an ordinary furnace. They sell direct, giving the buyer a high grade furnace at the lowest possible price, and at one small profit.

In the furnace shown here, the arrow on the left hand side, at the top, calls attention to the clean out, with smoke pipe on opposite side and can be turned to any direction to reach the chimney most conveniently and have the furnace front just where desired.



Some of the other good points are the galvanized iron castings, the sheet iron lining with asbestos between; the hot blast ventilator, the waterpot which supplies any desired amount of moisture, a return circulating-radiator, and a specially designed combustion chamber, etc.

The Bovee Grinder & Furnace Works are an old, well established company, owning and operating their own plant. They aim to manufacture a first-class furnace at the lowest possible cost, and feel sure that if those interested in heating will write for their circulars.

New Books for Building Mechanics

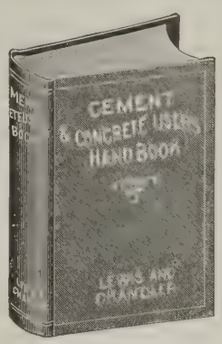
MODERN PLUMBING ILLUSTRATED. By R. M. Starbuck.

This book represents the highest standard of plumbing work. It has been adopted and used as a reference book by the United States Government, in its sanitary work in Cuba, Porto Rico and the Philippines, and by the principal Boards of Health of the United States and Canada.
It gives connections, sizes and working data for all fixtures and groups of fixtures. It is helpful in demonstrating and in figuring work. It gives the mechanic quick and easy access to the best modern plumbing practice. Suggestions for estimating plumbing construction are contained in its pages. This book represents, in a word, the latest and best up-to-date practice, and should be in the hands of every architect, sanitary engineer and plumber who wishes to keep himself up to the minute on this important feature of construction. 400 octavo pages, fully illustrated by 55 full page engravings. Price.....**$4.00**

STANDARD PRACTICAL PLUMBING. By R. M. Starbuck.

A complete practical treatise of 450 pages covering the subject of Modern Plumbing in all its Branches, a large amount of space being devoted to a very complete and practical treatment of the subject of Hot Water Supply and Circulation and Range Boiler Work. Its thirty chapters include about every phase of the subject one can think of, making it an indispensable work. Fully illustrated by 347 engravings. Price.....**$3.00**

PRACTICAL STEAM, HOT-WATER HEATING AND VENTILATION. By A. G. King.



This book is the standard and latest work published on the subject and has been prepared for the use of all engaged in the business of steam, hot water heating, and ventilation. It is an original and exhaustive work. Tells how to get heating contracts, how to install heating and ventilating apparatus, the best business methods to be used, with "Tricks of the Trade" for shop use. Rules and data for estimating radiation and cost and such tables and information as make it an indispensable work for everyone interested in steam, hot water heating and ventilation. It describes all the principal systems of steam, hot water, vacuum, vapor, and vacuum-vapor heating, together with the new accelerated systems of hot water circulation, including chapters on up-to-date methods of ventilation and the fan or blower system of heating and ventilation. 367 pages. 300 detailed engravings. Price.....**$3.00**

CONCRETE CHIMNEYS, SLATE AND ROOF TILES. By A. A. Houghton

The manufacture of all types of concrete slate and roof tile is fully treated. Valuable data on all forms of reinforced concrete roofs are contained within its pages. The construction of concrete chimneys by block or monolithic systems of is fully illustrated and described. A number of ornamental designs of chimney construction with molds are shown in this valuable treatise.....**50 Cents**

POPULAR HANDBOOK FOR CEMENT and CONCRETE USERS. By Myron H. Lewis

This is a concise treatise of the principles and methods employed in the manufacture and use of cement in all classes of modern works. The author has brought together in this work, all the salient matter of interest to the user of concrete and its many diversified products. The matter is presented in logical and systematic order, clearly written, fully illustrated and and free from involved mathematics. Everything of value to the concrete user is given, including kinds of cement employed in construction, concrete architecture, inspection and testing, waterproofing, coloring and painting, rules, tables, working and cost data. Price.....**$2.50**

ORNAMENTAL CONCRETE WITHOUT MOLDS. By A. A. Houghton.

The process for making ornamental concrete without molds, has long been held as a secret and now, for the first time, this process is given to the public. The book reveals the secret and is the only book published which explains a simple, practical method whereby the concrete worker is enabled by employing wood and metal templates of different designs, to mold or model in concrete any Cornice, Archivolt, Column, Pedestal, Base Cap, Urn or Pier in a monolithic form—right upon the job. These may be molded in units or blocks, and then built up to suit the specifications demanded. This work is fully illustrated with detailed engravings Price.....**$2.00**

CONCRETE FROM SAND MOLDS. By A. A. Houghton.

A practical work treating on a process, which has heretofore been held as a trade secret by the few who possessed it, and which will successfully mold every and any class of ornamental concrete work. The process of molding concrete with sand molds is of the utmost practical value, possessing the manifold advantages of a low cost of molds, the ease and rapidity of operation, perfect details to all ornamental designs, density and increased strength of the concrete, perfect curing of the work without attention and the easy removal of the molds, regardless of any undercutting the design may have. 192 pages. Fully illustrated. Price.....**$2.00**

CONCRETE WALL FORMS. By A. A. Houghton.

A new automatic wall clamp is illustrated with working drawings. Other types of wall forms, clamps, separators, etc., are also illustrated and explained.....**50 Cents**

CONCRETE FLOORS AND SIDEWALKS. By A. A. Houghton.

The molds for molding squares, hexagonal and many other styles of mosaic floor and sidewalk blocks, are fully illustrated and explained.....**50 Cents**

CONCRETE SILOS. By A. A Houghton.

Complete working drawings and specifications are given for several styles of concrete silos, with illustrations for molds for monolithic and block silos. The tables, data and information presented in this book are of the utmost value in planning and constructing all forms of concrete silos....**50 Cents**

MOLDING AND CURING ORNAMENTAL CONCRETE. By A. A. Houghton.

The proper proportions of cement and aggregates for various finishes, also the methods of thoroughly mixing and placing in the molds, are fully treated. An exhaustive treatise on this subject that every concrete worker will find of daily use and value.....**50 Cents**

Any of these books sent prepaid on receipt of the price. Address **NATIONAL BUILDER, Pontiac Building, CHICAGO, ILLINOIS**

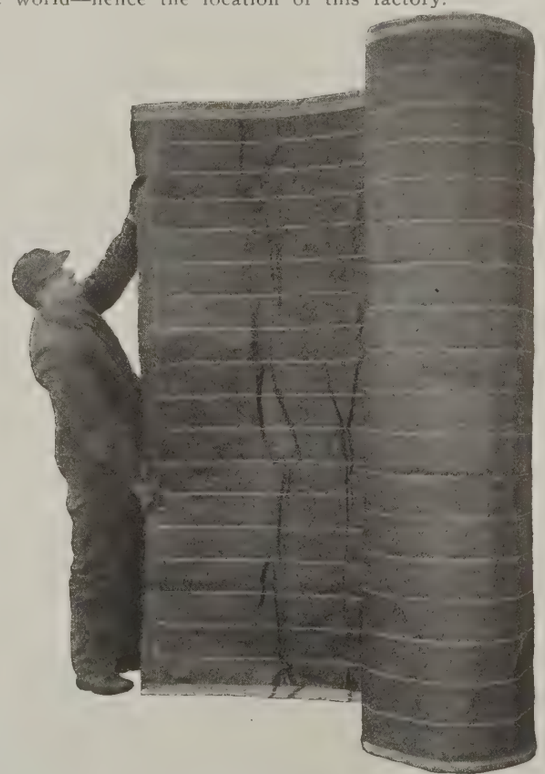
INSULATION FOR WALLS, PARTITIONS, CEILINGS, FLOORS.

A Flax Fibre Product Which Comes In Rolls Used with Great Success by Architects, Builders and Carpenters Everywhere.

Architects, builders and carpenters of late years have been advocating the use of more advanced forms of insulation for walls, partitions, ceilings and floors—manufacturers of various so-called building papers and quilts have been put to the test. Even owners have pressed hard on the acquirement of an efficient lining for homes and buildings which should be in as far as possible, a non-conductor of heat, cold and sound. That is, that it should not allow those to pass through it.



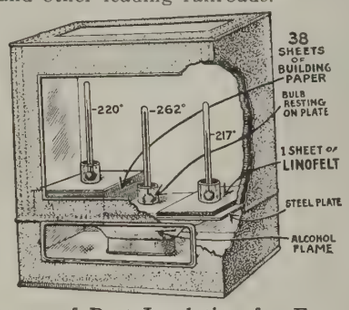
As a natural consequence, a product of flax, a form of flax fibre, from the same source as linen, obtained in rolls like ordinary building paper, is now advanced as the best insulating material for residences and buildings, and is being used very successfully by all who have given it a trial.

What we Mean by "Insulation."

To insulate is to "make an island of"—to "separate from conducting bodies by means of non-conductors." So to insulate a room the walls must be so constructed that they neither admit nor release, heat, cold, sound, dampness or vibration. Such a state of entire insulation—or isolation—is of course practically impossible to attain, and would in many respects be undesirable even if possible.

The usual insulation used in the construction of homes and buildings is known as "building paper." This "building paper" is most efficient in all uses for which it has been intended.

It accomplishes almost none of the results it is supposed to accomplish—and why any builder will longer tolerate its use is more or less of a mystery. The trade name of the real efficient material for insulating is Linofelt. It is a linen felt made from flax fibre. This is a product of the Union Fibre Company, of Winona, Minnesota. Winona is generally conceded to be the greatest flax market in the world—hence the location of this factory.



Linofelt (pronounce the "i" as you would in "light") is an insulating quilt made of degummed flax fibre, felted and stitched between two sheets of rosin-sized building paper. By this degumming process, all the vegetables, gum and oils are extracted from the flax straw and thereby all source of decay or disintegration is removed. The reason that a woolen blanket is warmer than a cotton one is because the wool fibre contains more of the tiny air spaces than the cotton.

Linofelt is like the woolen blanket—it contains countless of these little air cells and this "confined air" is the best possible non-conductor of heat, cold and sound. Linofelt is odorless and absolutely vermin proof. Bugs, rats, mice or other vermin will never touch flax fibre after it has been treated by the degumming process. It is also antiseptic and odorless—as sanitary as a surgical dressing.

As a sheathing Linofelt is used like building paper, between the weather-boards and lumber sheathing. It comes in rolls and is fastened on with lath exactly the same as you would put on ordinary building paper. A second layer of Linofelt (called Frost Linofelt) is used in place of back plaster. For this purpose it is not laid directly in contact with the lath, but it is tacked to the studs about two inches back of the lath, thus dividing the space between the lath and sheathing into two air spaces. It has been proven by actual tests that the above construction will save 40 per cent on fuel bills.

Real Insultation for Cold Storage Plants, Creameries, Breweries, Refrigerator Cars.

Linofelt is just as powerful in keeping heat out in summer as for retaining it in winter. In other words neither heat nor cold can penetrate this material. The best proof of this argument is that Linofelt is used in cold storage plants, creameries and breweries, such as Van Blatz Brewing Co., John Gund Brewing Company, A. Booth & Company, Fairmont Creamery Company. It is also used in refrigerator cars on the Chicago, Burlington & Quincy, Chicago & Northwestern R'y. Company, Illinois Central Railway Company, the Harriman Lines, and other leading railroads.

The Importance of Best Insulation for Farm Buildings.

The care of live stock during the winter months is a problem every farmer should give careful attention. It is particularly important that the barn should be so built as to keep out draughts; nothing will so quickly cause cows to run down as draughty quarters. The loss in milk supply would frequently amount to more than what it would cost to have made the barn comfortable and warm. A horse kept in a warm stable will go through the winter in much better condition. A chilled animal cannot digest food so as to get the greatest benefit from it. It is an old saying that a warm barn in winter is a cool barn in summer. A warm, comfortable poultry house is just about the best investment that the owners of the poultry can have. Give hens comfortable quarters where they won't freeze their combs and your supply of eggs will keep up to a surprisingly high figure.

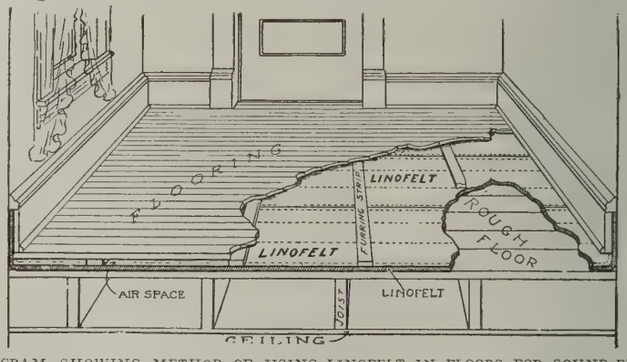


DIAGRAM SHOWING METHOD OF USING LINOFELT IN FLOORS FOR SOUND-DEADENING PURPOSES.

Linofelt is not Expensive.

Yet Linofelt is not expensive and adds less than one per cent to the cost of residences and buildings—but at least 40 per cent to their warmth in cold weather—and almost equals that record in keeping out the extreme heat of summer.

As a deadener of sound Linofelt is extremely efficient. Experiments have demonstrated that the same sound heard 200 feet through ordinary building paper is heard only two feet away through Linofelt. Apartments that have been made sound proof by the use of Linofelt are found to be in great demand and besides renting more readily bring a larger rental. Its sound-proof quality is desired everywhere and especially in school buildings, hospitals, offices and hotels. When dance floors are insulated with Linofelt no disturbance occurs on the floor below.

No house is too small to have Linofelt. It makes the house quiet, comfortable, and restful. The booklets issued by the Union Fibre Company are sent free upon request. These books show the methods adopted in using Linofelt in walls, floors, ceilings and partitions.

Architects, builders and contractors, invariably specify Linofelt after they become acquainted with it.

The Union Fibre Co., Winona, Minnesota will send samples and full information freely upon request and a large force of experts who are familiar with scientific insulating is constantly maintained for consultation. The services of these experts are free to contractors, architects and any others requiring such advice.

THE WINTHROP

SOLID TAPERED ASPHALT SHINGLES

Are of a Cool, Gray Slate Color

And have the durability of asphalt—the fine appearance of slate and the light weight and low cost of wood shingles. They are fire-resisting—weather proof—wind and sun-proof and never crack, break or fall off. Laid with regular shingle nails, the same as wood shingles.

The A. A. Wood & Sons Co., -:- Atlanta, Ga.

Standard Spring Floor Hinges

Chicago, Ill., Feb. 23, 1911.

THE STANDARD MFG. CO.,
Shelby, Ohio.

Gentlemen:

In my twenty-two years experience I have used all kinds of double acting spring floor hinges. I have also used the STANDARD Spring Floor Hinge, and astonished by the results superior to any other.

First of all, one of the essential points: It eliminates labor necessitated by cutting a hole in the floor, which has its disadvantages.

The Spring is very powerful and another advantage is proven in the convenience by which it can be adjusted, simply by removing the plate instead of removing the door from its position.

I cannot say too much of it as a labor saver.

Yours. etc.,
A. SORENSEN

Torrington, Conn., Feb. 7, 1911.

THE STANDARD MFG. CO.
Shelby, Ohio.

Gentlemen:

I am a persistant user of your handy STANDARD Double Acting Spring Floor Hinges, and am always glad to express my reasons to anyone.

The following is the argument I employ when questioned about this device:

1. It is made of good material.
2. It is simple and has lasting qualities.
3. It does away with all floor wedges used to hold the door open, thus saving the valuable time of the builder as well as his customer.

Thus far I have never met anyone that did not appreciate the usefulness of your world-beater floor spring.

Yours, etc.,
AUGUST DIDIER.

Lamark, Ill., 2-21-1911.

THE STANDARD MFG. CO.,
Shelby, Ohio.

Gentlemen

The Standard Spring Floor Hinge is the best. Is all steel, double acting, durable and simple. Will positively control doors swinging in either direction. Is noiseless and positive in action. Is adjustable to doors of various weights. Will remain open if desired. The case hardened ball bearings and wearing parts carry weight of door and thrust of spring. The hook attachment does away with mortise and brings weight of door directly over bearings. Alignment screws are placed where anyone can adjust door. Finish plates cover all defects in cutting. The STANDARD Spring Floor Hinge satisfies all customers because it is always in working order.

Yours, etc.,
WALTER HAWES.

Results of Prize Contest

We have known all along that STANDARD Double Acting Spring Floor Hinges were **good.** But until the answers from our prize contest began pouring in we had not realized how enthusiastically the trade had adopted them.

The five letters herewith reproduced were considered the best from among the huge quantity sent in. The judges could not decide upon which one was better than the other four, so the prize was divided into five equal parts and a check for the amount has been sent to the winners.

All you carpenters and builders who use hinges are requested to read these letters. They are written by men like yourselves—actual users of STANDARD Hinges — and clearly prove **our** statements are based on facts.

After you have read them, write for our literature and prices.

The Standard Mfg. Co.

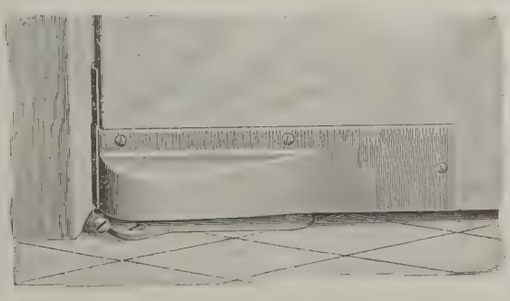
SHELBY :: :: OHIO

Lincoln, Indiana, Feb. 13, 1911.

THE STANDARD MFG. CO.,
Shelby, Ohio.

Gentlemen:

The STANDARD is neat and simple in construction. It has a detachable floor plate that adjusts itself to the floor level. It will hold the door open in either direction, also permits door to be taken down without removing any screws.



The short plunger takes same side movement as spring; this with the ball bearings produces a noiseless and easy moving door. The hardened steel bearings and ball race give life to the hinge. The hook attachment with easy access to spring adjustment and alignment screws, together with the separate finish plates, saves half the labor of other makes. Yours, etc.,
O. H. BECKWITH

Cincinnati, Ohio, Jan. 31, 1911.

THE STANDARD MFG. CO.,
Shelby, Ohio.

Gentlemen:

First the hinge is placed at the bottom of the door and carries the weight of the door on ball bearings, thereby reducing the friction to a minimum and causing the door to swing easily and noiselessly. Second, the wearing parts are made very true and of hardened steel, which contributes to ease of action and long lasting qualities. Third, the construction is very simple and the hinge is therefore easily put on a door, quickly adjusted to work right and does not get out of order. This commends it, not only to the expert mechanic who wants to get his work done quickly and to do it well, but also to the less skilled man who may not have had much experience in putting on hardware of this description. And finally after the hinge is put on it pleases the owner because it works easily and well, and looks neat whether it is put on a common pine door or upon the most expensive oak, birch or mahogany door, and is therefore never out of keeping with its surroundings. Yours, etc.,
EDWARD A. PEACOCK

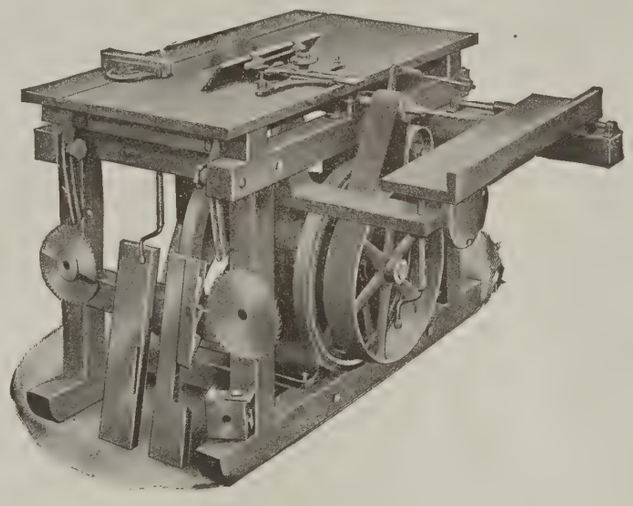
AMERICAN "CONTRACTORS'" PORTABLE SAW BENCH.



No matter how large or how small the job, nor how carefully the material is listed for the mill, there is always a large amount of sawing, boring, mitering, dadoing, etc., to be done in the shop or on the job.

Until recently, this either has been done laboriously by hand or foot power and a delay resulted from sending to the shop or mill for extra or odd pieces. Then, too, there is a lot of work which cannot be run out until the building is practically ready for it.

At a time like this, every contractor appreciates work which may be done on a portable saw bench and variety worker. The variety of work suitable for a machine of this character makes it valuable for the shop as well as the job. Its portability allows its use in the shop in getting out the bulk of the work, and then being taken to the job for the cutting and fitting.

As it is practically self-contained, it can be placed to the best advantage as to light, etc., or moved to another place where another strip may be run up through doorways or windows.

Some contractors move the machine up from floor to floor as the work progresses, as it can either be brought to the work or the work brought to the machine.

A machine of this description is manufactured by the American Saw Mill Machinery Co., Hackettstown, N. J.

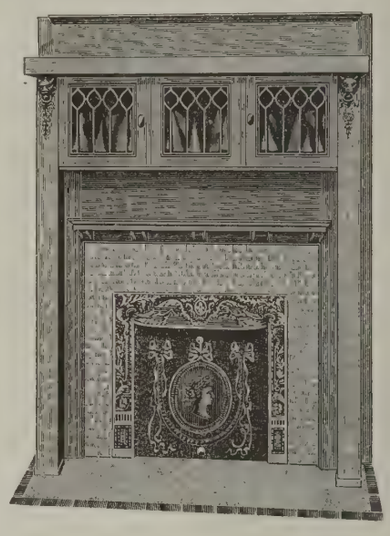
Standing on hard-wood skids, covering a space only 54 inches square and weighing less than 1,000 pounds, it is equipped to do cross and rip sawing, boring, dadoing, jointing, rabbeting, etc. It is designed to rip 1-inch stuff at the rate of either 75 to 125 feet per minute, and will work up to 4-inch stuff.

The manufacturers claim that the machine will save its cost on one job, and that is easy to believe when it is considered that a large part of the cost of concrete construction is in the cost of cutting the lumber for forms, etc. As will be seen from the cut the frame of the machine is built for service, being of hard wood bolted together, insuring strength, rigidity and durability. The motive power may be either gasoline engine or electric motor, built in the frame. The adjustment of the machine allows a variety of work to be done with little delay in changing from one class of work to another.

The American Saw Mill Machinery Co., Hackettstown, N. J., will be pleased to give further information and quote prices on an equipment best suited to the contractor.

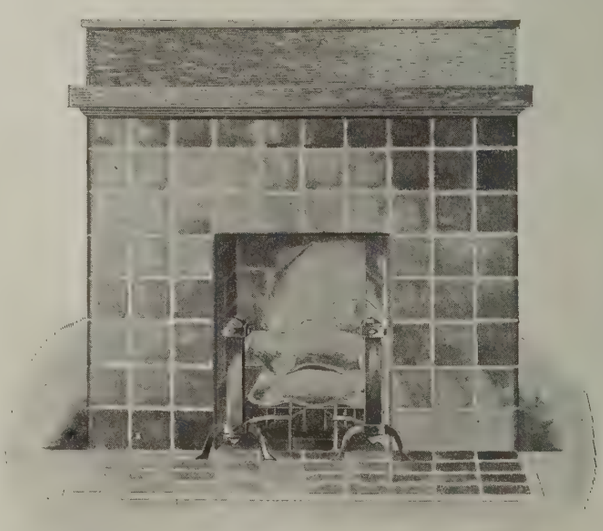
"RED TOP" ASPHALT SHINGLES.

The Cincinnati Sheet Metal & Roofing Co., 36-40 Main St., Cincinnati, O., have been manufacturing an asphalt shingle for quite a number of years—the entire output of which has heretofore been used up in their home city. This in itself is an unusually strong recommendation for its use for the home architect is often the last to believe in a locally manufactured material. But in the case of "Red Top" Asphalt Shingles, the leading architects needed just such a roofing. The beautiful gray, green and red slate colors in which these shingles are made give the architect and property owner an unusually good opportunity of securing a roof which not only adds greatly to the fine appearance of the building, but also makes a substantial material.



"Red Top" asphalt shingles are manufactured in one size and that is 8x13 inches. They are made of pure wool felt and of the best asphalt. The top or exposed surface is covered with real slate chippings in red granite, gray, green plate and red slate colors, doing entirely away with painting. "Red Top" asphalt shingles are fire, hail, storm and water-proof. As the shingles are made of asphalt, it is not necessary to use galvanized nails for every nail when driven through a "Red Top" shingle is coated with asphalt, giving it a much longer life. The shingles are laid 4 inches to the weather. A hammer and a knife are all the tools that are needed for laying "Red Top" shingles. The knife is used to trim when laying around ridges or trimming for gutters. The work of laying is done twice as quickly as with wooden shingles because one asphalt shingle covers twice as much surface. When "Red Top" shingles are laid they are flat, and flat they remain, never buckling or warping and the longer they are on the tighter the roof gets. They are packed one-quarter of a square to a case and one square covers 100 square feet.

The Cincinnati Sheet Metal and Roofing Co. will be glad to co-operate with architects and contractors in other states, with a view of getting "Red Top" asphalt shingles introduced. They will send samples, catalogue, and prices on request, and their guarantee is one which fully protects anyone who specifies or buys their shingles.



ATTRACTIVE AND COMFORTABLE HOMES.

Home is what we make it—within its walls. The home as a structure may be ornamental and attractive to look upon, but the most elaborate exterior could not add to the comfort and attractiveness of the interior, "the dwelling place of the house."

It is the sacred pledge of our lives where the ties of love and affection are knit more closely together.

Every home builder should give the interior of his home the most careful consideration and one of the most important features that makes a home comfortable and attractive is the open fireplace combined with a suitable and well proportioned mantel. The greatest care should be exercised in the selection of mantels, to get the proper wood and finish and also the color and texture of tiling, producing a happy and pleasing combination in perfect harmony with each other.

The great variety of designs shown in the handsomely illustrated catalogue issued by Moorman & Otten, 611-613 Main St., Cincinnati, Ohio, will enable the home builder to make a ready selection for his new home. With a copy of the catalogue before him, the contractor or architect is able to assist the owner in the selection of a mantel best suited to his individual requirements.

This firm has been in the mantel business over twenty years and has established a record for fair dealing, and is well qualified to give any information or supply anything appertaining to the mantel or fireplace proposition. Their catalogue, showing about fifty of their latest designs, will be sent upon request.

Carpenters and Builders—Read:

Take Up Slate Roofing in Your Territory—This Spring

Wherever there are roofs of private residences, churches, schools, public buildings, barns or factories to be laid—slate is stipulated in the contract.

Prepare now to get and hold this profitable business—by taking up slate roofing. It is easy to learn, can be conducted in connection with your present line with no extra trouble or expense and will yield sure and increasingly satisfactory returns.

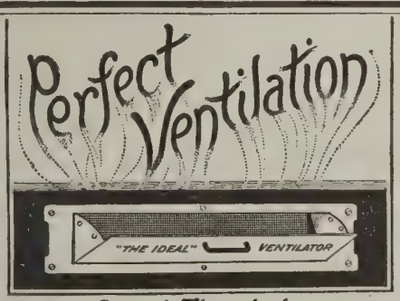
If *your* territory is *not* already covered by a slate roofer—now is the time to establish yourself in this business and take orders for

SEA GREEN OR PURPLE ROOFING SLATE

the one roof that *never wears out;* can't rust or decay, crack or disintegrate; that never requires repairs, is fire and spark proof; that reduces insurance rates, affords clean, pure cistern water and is practically indestructible.

Wherever new roofs are to be laid or wherever there are worn out shingles, metal, tin or composition roofs *to be replaced*—there is business for *you.*

A few simple, inexpensive tools and a little capital is all that is necessary. If there is no Slate Roofer in your territory—write to us at once for delivered prices on slate, tools, supplies. We furnish all the necessary *instructions free.*



Don't put off—write now—today.

"FAMOUS FOR DURABILITY"

Get Your Sample Today

Their Rooms Kept Warm in Winter, Cool in Summer

THESE Homes and this magnificent high school building are the more highly **valued** because their walls are insulated with **Linofelt** and not with ordinary building paper.

In the case of the high school building, each room is very quiet and isolated because **Linofelt** is sound-proof and noise is kept out. We want architects, builders and owners to send for our beautiful **free** books which show many such illuminating examples, tell **all** about **Linofelt** Lith Board and Rock Wool, give the plans, method of sheathing walls, floors and ceilings, to keep out the heat of summer and have the house cool, to keep out the cold of winter and have the house cozy and warm in every cubic inch of its space and keep out all noise all the time.

LINOFELT
Linen-Felt made from Flax Fibre

The white house at the top of the left border is in New Orleans; the **Linofelt** used in it cost only $31 more than ordinary building paper; it has added many times that sum to the actual **value** of the house. Considering tests show **Linofelt** is 38 times more effective than building paper, we do not believe there is a single architect, builder or owner who will not insist on using it once he knows about it.

Linofelt is an insulating quilt. No other is as light as **Linofelt** cubical contents considered. It is odorless, chemically clean, sanitary. It saves 40 per cent in fuel bills. It is the best sound deadener. The same sound heard 200 feet through ordinary building paper is heard only 2 feet away through **Linofelt**. These features make it especially valuable for homes, hospitals, sanitariums, office buildings, school buildings and all structures where comfort and quiet are absolutely essential.

Linofelt is so preeminent as the greatest insulating material that it is used in thousands of refrigerating cars. For building purposes, it is equally important in either northern or southern climate.

Linofelt comes from the same source as linen. It is made from flax in the largest flax market in the world—Winona. Its manufacture is supervised by experts—engineers and specialists who have developed perfect processes and who know **all** the uses and exactly what is required. The methods and plans they have put into effect into hundreds of state'y houses and buildings such as are shown here have made architects, builders and owners alike enthusiastic.

Building Men, Send for Our Beautiful Book

Here's the knowledge that will enable you to get ten years ahead of your competitor right away. Our book is exceptionally attractive, full of fine home elevations, methods of using **Linofelt**, Lith Board and Rock Wool. Let us tell you what **Linofelt** is, how it is made and this alone will convince you that it will do more than we claim it will—that its adoption in your work will prove a lasting benefit and satisfaction to you. A NEW "COMBINATION WOODWORKER."

The Tannewitz Works, Grand Rapids, Mich., are completing the tryout of a new combination woodworker for millmen, contractors and builders, and will place it on the market within the next thirty days. The machine will be illustrated and discussed at some length in a later issue of this journal. Such information that has been given out so far indicates that this concern has spent over a year in careful investigation and consideration of the needs of this branch of the woodworking industry. They promise that the result of their labor will be recognized as a decided step upwards for all contractors, builders and millmen who are interested in modern methods for reducing labor costs and quickening the completion of jobs. Such a machine would prove of great benefit and it is suggested that all interested readers should write the Tannewitz Works, Grand Rapids, Mich., for the advance information, which it is understood will soon be off the press.

NEW BUILDERS' HARDWARE CATALOGUE.

CYLINDER FRONT DOOR SET AND HANDLE.

Not so many years ago very little attention was paid to the hardware for residence work. The only place that the contractor and property owner could learn about the different designs and finishes of a lock set was to go down to the hardware store and look over the stock. This was not always convenient, especially when the contractor and home owner were going over the plans and figuring things out. The contractor not having well illustrated catalogues to show the property owner what he was going to get for hardware and not having any samples to show the different finishes, was at a disadvantage and, therefore, the matter of hardware received the least attention. This was not a fair proposition to the hardware end for nothing dresses a house up more than high-class builders' hardware. It will add so much to the good appearance of the building that it makes the property easier to sell and more valuable in every way. The large manufacturers' printed catalogues fully describing their different lines but those catalogues were big, bulky affairs, intended only for dealers and many of them were so inconveniently arranged that it was hard to figure out the different designs, prices, etc. Besides, the contractor could very seldom borrow such a catalogue so when the Rehm Hardware Company completed their book on builders' hardware and got it up especially for contractors and builders, it met an instant and popular demand.

The catalogues which the Rehm Hardware Company began printing years ago, have been steadily increased in size, until now they are able to give, without any charge, whatever, a book so full of illustrations of high-class builders' hardware, etc., that it gives the contractor specifying and estimating from it, an extraordinary advantage over the man who is not lucky enough to have one. Their 1911 catalogue is just off the press and ready for distribution. In it, is illustrated everything needed to complete houses with the latest and most up-to-date hardware. It contains a fine assortment of Cylinder Front Door Sets and Handles in all of the leading finishes; Cylinder and Regular Store Door Locks and Handles, ranging in prices from $1.45 per set up to $15.00 per set. Sargent's Union Lock Sets, Cylinder and Bit Key Door Sets in Cast Bronze Metal wrought bronze metal and steel plated finished. Prices from $1.35 per set to $10.00 per set.

Also Inside Lock Sets consisting of all the leading and up-to-date designs for bungalow or office buildings. Prices from $3.15 per dozen sets to $39.60 per dozen sets. Glass Knobs, Door Knockers, Nickel Plated and Bower Barff sets, Sash Locks in all finishes. Prices from $0.33 to $3.10 per dozen. Sash Lifts $0.12 to $2.70 per dozen. Casement Fasteners and Adjusters, Door Holders, Flush and Chain Bolts, Butts and a big assortment of Double Acting Spring Hinges, Screen Hardware, Sliding Door and Barn Door Hangers, Galvanized Gutter, Ridge Roll, Finals and Tools.

The Rehm Hardware Company, 1503 Blue Island avenue, Chicago, have been advertising in every issue of THE NATIONAL BUILDER for the past five or six years and have among its subscribers many men who appreciate the advantages of an easily understood catalogue which enables them to make selections from the latest designs and standard makes and at wholesale prices.

If you have not received one of these new catalogues, it is surely worth while to write for one. In estimating on the different designs and makes the Rehm Hardware Company never deceive the buyer in giving prices on coated ware, when solid copper or bronze is wanted.

In the first place, they tell the prospective buyer exactly how to tell the difference between the coated and solid materials and in doing this, the buyer is always assured of getting figures based on just what the article is and later on when ordering, receives exactly what he pays for. This means a great deal to the contractor and builder and to the property owner and by thus dealing honestly and fairly with all their customers, the Rehm people, have gained for themselves the confidence of their customers. The new catalogue is worth having, even if you happen to have an old one on file.

Fighting The Trust!

The Smashing Anti-Trust Fight Now On!

Trust Prices Eclipsed at Last!

An absolutely *first-class* **high-grade** watch at a price within the reach of the people—the Burlington Special Anti-Trust Watch.

The World's Masterpiece of watch manufacture—the Burlington Special—now sold direct to the public at its *rock bottom, anti-trust* price (and besides without middlemen's profits.

We do not care what it costs—we will uphold our independent line and so we are making the most sweeping, baffling offer ever made on watches.

Some trusts are legal and some are not. **We do not say that the watch trust is illegal;** but we do say that the **methods** of the giant factories in making "contracts" with dealers **to uphold double prices** on watches is very **unfair**—unfair to **us** and **you.** Hence our **direct** offer on the Burlington at the **very same** price the **Wholesale** Jeweler must pay.

This is *your* opportunity—**NOW**—while this great Anti-trust offer lasts—get the best watch made anywhere at one-third the price of other high-grade watches. Furthermore, in order to fight the Trust most effectually, we even allow terms of

$2.50 a Month on our finest watch—easiest possible payments at the rock-bottom price, the identical price the **Wholesale** Jeweler must pay.

WATCH BOOK ON REQUEST.

Now do not miss this opportunity. At least we want you to know about WATCHES and WATCH PRICES. Write today.

BE POSTED—Send a postal or letter and get the free book. It tells you how to judge a watch. You should get this great book if you ever expect to own a watch.

HERE IS THE LEVEL YOU CAN ABSOLUTELY DEPEND UPON

The very nature of a level demands accuracy. Its purpose is to prove whether *your* work is accurate or inaccurate, therefore you must have a level that you *know* is right—one that you can fully depend upon.

Akron Eclipse Levels are the standard of accuracy to which others are compared. No other levels have those clear, distinct Silver Lines, around the spirit tube, which show L-E-V-E-L, or otherwise, instantly, and can be seen at a considerable distance. No other level is so scientifically accurate, or so satisfactory to skilled mechanics.

Akron Eclipse Levels

are exceptionally strong and durable. The spirit glass is carried on elastic bearings and enclosed in an outer tube of heavy steam-gauge glass which is practically unbreakable. Thus it will endure the falls and jars incident to daily use, without injury. All glasses are adjustable so that accuracy is assured under all conditions. Made in 33 styles and sizes for carpenters, masons, concrete men and everybody who uses a level—many with two plumbs so that stock can be applied either end up.

In spite of all their superiority, Akron Eclipse Levels cost no more than the ordinary kind.

Sold by Hardware Dealers Everywhere

If you want the best, the most durable, the most accurate level ever made, ask your dealer for an Akron Level. Insist on having an Akron. Don't accept something else for there is nothing else "just as good."

If your dealer does not sell Akron Eclipse Levels, write us for catalog, mentioning dealer's name, and we will see that you are supplied without delay.

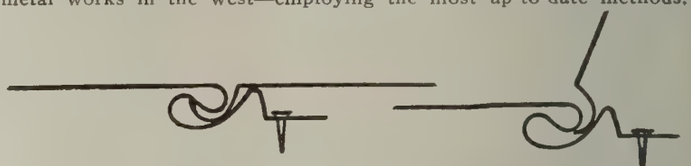
"TITELOCK" METAL SHINGLES.

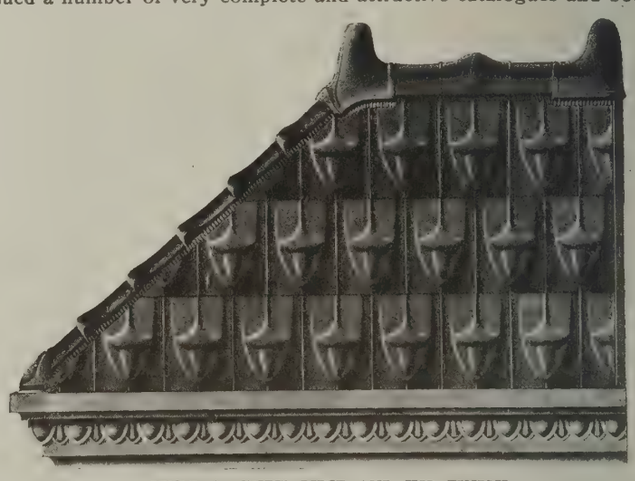
The Metal Shingles which we are illustrating and which are described here are manufactured by the Milwaukee Corrugating Company of Milwaukee, Wis., and are placed on the market under the name "Titelock." The Shingles have met with exceptional success, and are being specified by many of the best architects and used by the most conscientious contractors and builders.



STYLE A—SHOWING METHOD OF LAYING

"Titelock" Metal Shingles are not made from a galvanized sheet. They are manufactured from full-weight terne-plate. After the shingles are completely formed they are dipped into paint or submerged in spelter, as the case may be. This method of galvanizing Metal Shingles insures an absolutely perfect coating of spelter. There are no raw edges exposed to the weather, no places on which the zinc coating has been cracked, and the perfect covering absolutely protects the iron from corrosion. Our readers can easily realize why "Titelock" Metal Shingles have so generally met with the approval of the architect, contractor, tinner, hardware dealer and property owner, all over the United States and Canada, and why the life of these shingles exceeds that of others.

"Titelock" Shingles are made in two sizes, 7x10 inches and 10x14 inches—painted or galvanized in both styles, "A" and "B."

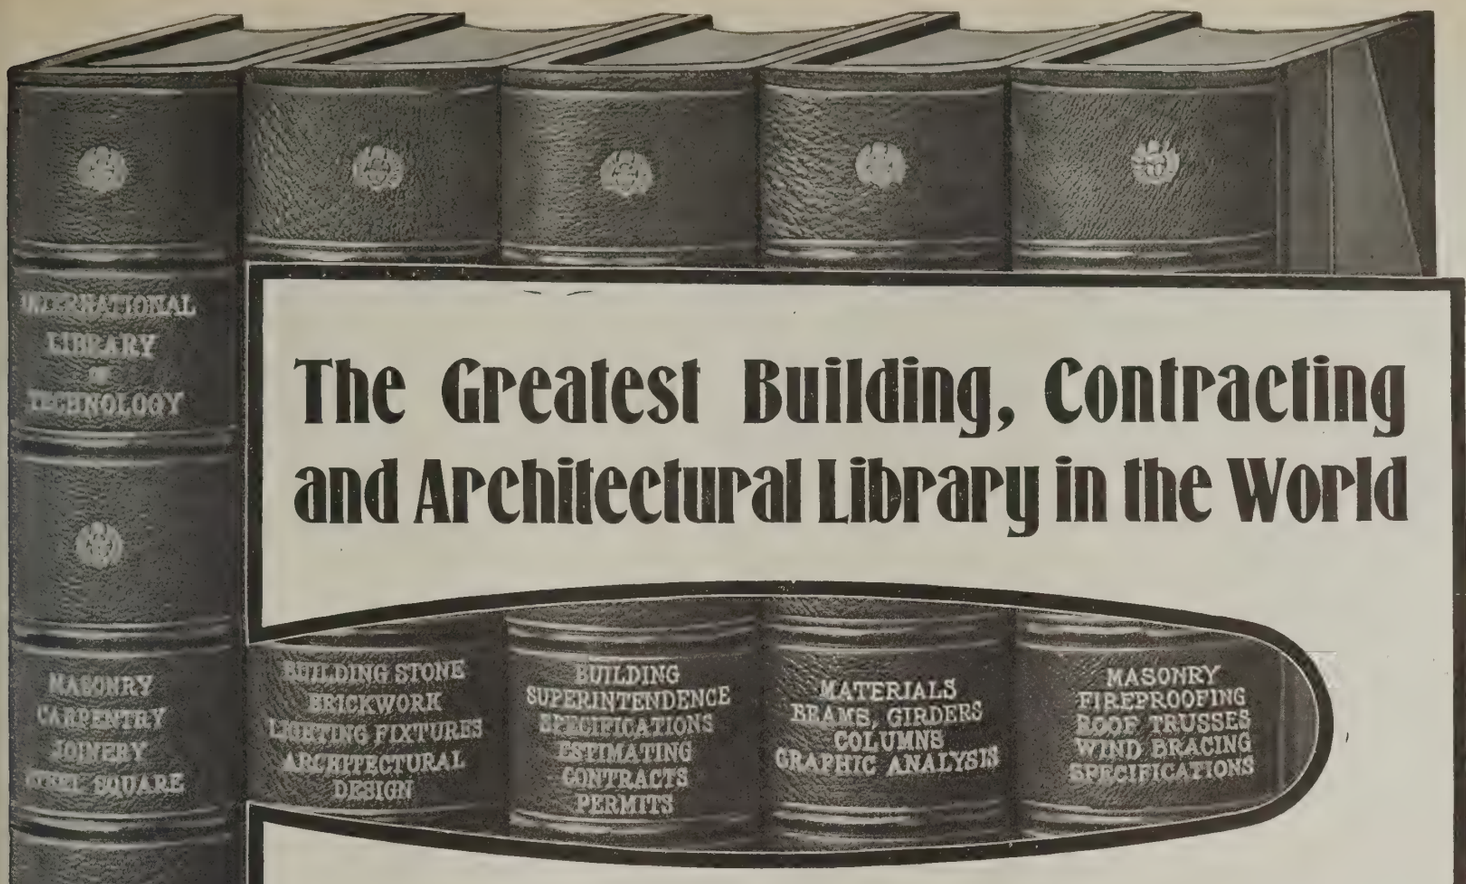


The Milwaukee Corrugating Company is one of the largest sheet metal works in the west—employing the most up-to-date methods,

SIDE LOCK—WHEN LAID IN PLACE SIDE LOCK—WHEN LAYING SHINGLE

using only the best materials and producing a line of sheet metal shingles which have gained for that company a high place in the building material field.

In order to make it easier for specifying and buying, they have issued a number of very complete and attractive catalogues and book-



STYLE A—WITH RIDGE AND HIP FINISH

lets and these, together with samples of their "Titelock" shingles, they are sending out free of charge to those interested. We would suggest, therefore, that any of our readers or their friends who are interested in building should take advantage of the opportunity of posting themselves thoroughly on these shingles and write the Milwaukee Corrugating Co., Milwaukee, Wis., or Kansas City, Mo., to send them this information, prices and samples.

LUTHER CARBORUNDUM TOOL GRINDERS.

A good carpenter, or any other user of fine tools, will not only get everything out of them that the manufacturer claims but will often surprise the maker or inventor by showing him an entirely new use for them and one that would never have been thought of had not a necessity arisen for it. Take the Luther Diamond Tool Grinder for instance. It is advertised by the manufacturers to sharpen chisels, planes and other of the smaller tools, yet a new use was discovered for it by a carpenter. This carpenter got a job cutting down trees in the woods, while on the Pacific Coast. Being a thinking and reasoning sort of fellow, and having a desire to do his work as easily as possible, and knowing that sharp tools not only cut easier but faster, he tried sharpening his ax on a small carborundum grinder he had with him. That sharpener was a Luther Diamond Tool Grinder. Finding that it not only did the sharpening quicker and better than the big, old-fashioned grindstone the lumber company owned, he was soon the envy of the whole camp. For no man in the gang had such sharp axes, and no one did better or as much work, and yet he never asked to have any sharpening done on the old company grindstone. It was not long before the foreman found out that the carpenter always car-

The Greatest Building, Contracting and Architectural Library in the World

This Library of Architecture is part of the 99 volumes of the International Library of Technology that cost over $1,500,000 in its original preparation. It contains the results of years of experience of the best building experts in the country. It contains the best modern practical methods used in every branch of architecture. The matter has been written by the foremost technical building experts and illustrated by a special staff of artists and craftsmen. Not only is this Library suited for architects already well trained in their profession, but it is especially adapted for the use of laborers, carpenters, and contractors that wish to acquire in the easiest and most thorough manner the knowledge that will qualify them for advancement. This Library is the only practical technical library in existence wherein the subjects treated can be readily understood and practically applied by persons having no knowledge of higher mathematics.

The volumes of the International Library of Technology are used and indorsed by 95 of the leading colleges and universities throughout the country. They are also indorsed by leading engineers. An example of these indorsements is to be found in the statement of **Frank L. Mueller, Assistant Secretary of the O'Rourke Engineering Construction Company, of New York,** who states: **"Some time ago I received several volumes of your Library of Technology and it will certainly give you pleasure to know what I think of these books. I have at my disposal a reference library containing more than one thousand engineering books, but I must say that none of these works contain the information generally desired in such concise and simple form as the volumes of your Library of Technology."**

A partial list of the subjects contained in the Architectural Library is as follows: Excavating, Shoring, and Piling; Footings and Foundations; Areas, Vaults, and Retaining Walls; Cements; Concrete Construction; Stone Masonry; Stone Arches; Carpentry; Mechanics of Carpentry; Joinery; The Steel Square; Building Stone; Lathing, Plastering, and Tiling; Common Brickwork; Ornamental Brickwork and Terra Cotta; Lighting Fixtures; Use and Design of Lighting Fixtures; Architectural Design; Building Superintendence; Specification Writing; Specification-Writing Memoranda; Estimating and Calculating Quantities; Contracts; Permits; Fireproofing of Buildings; Stair Building; Ornamental Metal Work; Builders' Hardware; Roofing; Sheet-Metal Work; Mill Design; Loads in Structures; Properties of Sections; Materials of Structural Engineering; Beams and Girders; Columns and Struts; Details of Construction; Graphical Analysis of Stresses; Roof Trusses; Statics of Masonry; Heavy Foundations; Retaining Walls; Fireproofing; Roof-Truss Design; Wind Bracing; Specifications; Geometrical Drawing; Projection Drawing; Freehand and Ornamental Drawing; Wash Work and Brush Drawing; Elementary Perspective Drawing; Architectural Drawing; Painting and Interior Decoration; History of Architecture and Ornaments.

There are 10 volumes in this Architectural Library, beautifully bound in three-fourths red morocco, stamped and numbered in gold, printed on a very high-grade book paper, and fully and practically illustrated. They may be purchased in sets of five or more volumes. Each volume is 6×9 inches in size. For full information, **send this coupon NOW.**

Structural Steel and Ornamental Iron Workers

No. 1—Steel Joist Hanger for Wood Header.

No. 4.—Steel Joist Hanger for Brick Walls.

ried that small Luther grinder with him, when working up among the trees, and sharpened his axes right on the job. It wasn't long, either, before Luther Diamond Tool Grinders were being used entirely in that neck of the woods for sharpening the axes. So the manufacturer found out in that way that Luther Grinders, although small, compact affairs, and not intended for such heavy work as sharpening axes for timber, were plenty strong enough and well made to do more than they were originally intended for.

Right there is the point that manufacturers often overlook, but the Luther Grinder Mfg. Co. started out to make the very best grinder they could, and the evidences of their success is daily shown by the great number of Luther Grinders that are being used, and the constantly increased size of their factory. They are now said to be the largest manufacturers of Carborundum grinders in the world, having increased their outfit from a few to thousands. Luther Diamond Tool Grinders are claimed to be 25 times faster than the grindstone and six times faster than emery wheels. Luther grinder wheels are genuine carborundum. Carborundum wheels do not glaze, they peel steel away in tiny shavings at the lightest touch; no hard pressure is necessary, and there is no danger of drawing temper.

There are many other good points about the Luther grinders, and the best way to find out about them is to write the Luther Grinder Mfg. Co., 55a Madison St., Milwaukee, Wis., for their circulars, prices, etc. They will be glad to give full particulars.

OTTUMWA SASH PULLEYS.

In Ottumwa Sash Pulleys it will be noticed that the manufacturers have done away with the small pin axle, and instead, make a pulley (in either ball bearing or cone bearing) which has a large ⅝ inch bearing. The extreme size of same insures long life, a rigidly upright wheel and smoothness in operation. The wheel is fastened together by six circular eyelets, not simply the points turned over, but are wedged down tightly around the full circle, on the principal of a shoe eyelet. The two sides of the casing are swedged securely together by a large ½-inch circular eyelet, formed in the same manner as in the wheel and far superior to the fastening of axles.

This method of manufacturing guarantees greater strength than the methods heretofore employed, and the weatherproof finish with which these pulleys are coated is also a valuable feature. It is not uncommon to see buildings partly constructed with the window frames set or lying about and the pulleys exposed to the elements in such a way that the ordinary pulley cannot help but prove unsatisfactory from rusting within a short time. Ottumwa pulleys, however, being weatherproof, are not affected as other pulleys are in this respect.

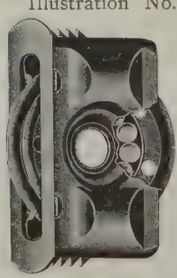
One-half actual size. Detail showing deep groove, gripping the lower half of the balls.

Close inspection of Ottumwa pulleys clearly shows that they are made for service, and have distinctive features. The large lubricating bearing (built on scientific principles), the rigidly upright wheel that does not wabble nor chatter, together with the weatherproofing means long life and a noiseless, fine running pulley.

In the Ottumwa plan of construction the use of the largest possible number of balls is employed and these give a larger bearing, and Ottumwa pulleys are guaranteed under cord and equal weight to carry longer than any other pulley without noise.

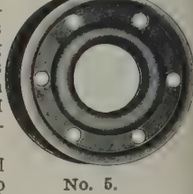
No. 2 shows an Ottumwa Ball Bearing Pulley, made in black finish. It has extra heavy face, 1 inch wide by 4 inches long and $\frac{1}{16}$ inch thick. Mortise 2½ inches long by ⅝ inches wide. Actual size of wheel is 2 inches.

No. 2. One-half actual size.



For No. 7 mortise in any one of three ways: First bore three one-inch holes in line, centers ¾ inch apart of bore mortise with Johnston & Sharp Manufacturing Company's Triple Boring Bit, or make a common straight side mortise with round ends, 1 inch wide and 2½ inches long. This style of fastening is preferred for soft wood frames.

No. 7. One-half actual size.



No. 9 can mortise any one of three ways. This pulley fastens itself securely when driven into the mortise, thus saving much time. It is recommended for use in hard pine frames.

Illustration No. 4 shows the large conical, concaved axle in the Ottumwa Ball Bearing Pulleys, the deep groove gripping the lower half of the balls, and explains in detail the unusually fine workmanship and scientific operation of the pulley.

No. 9. One-half actual size.

Cut No. 5 shows the Ottumwa Cone Wheel containing lubricant. Attention is called to its scientific regard for centralizing wear under pressure within its cone bearing.

No. 5.

The Ottumwa line of sash pulleys, both ball bearing and properly fitting concaved conical track. are manufactured by the Johnston & Sharp Manufacturing Company, Ottumwa, Iowa, who feel that a test will make permanent users of their pulleys. It is this high class trade that they are aiming to secure through our readers. Many sash and door or mill concerns have for years been using these pulleys, and contractors operating good sized shops will find the Ottumwa line the one to use in all their work. They are packed in cases of 50 dozen and in barrels, 100 dozen each, and can be had in black, brass, oxidized copper or lacquered face.

This Great Book of Plans

Compiled at a Cost of Over $5,000.00 By Our Licensed Architects

Free to Carpenters and Contractors

Save Architect's Fees!

The Gordon-Van Tine Service for Contractors and Builders not only includes supplying Millwork and Lumber at *inside prices* but provides complete, practical working plans and blue prints, drawn to architects' and builders' scale of one-quarter of an inch to the foot. *This saves all architects' fees and adds a handsome extra profit on every building erected.*

Houses, Cottages, Bungalows, Costing $600.00 to $6,000.00

The Gordon-Van Tine *Book of Building Plans* is the most simple, practical, authoritative and up-to-date work of its kind ever published. It contains the latest and best ideas of the architectural world. It gives thirty-two designs for city and country residences, cottages and bungalows, ranging in cost from a few hundreds to several thousands of dollars. It has twelve plans for farm, dairy and cattle barns, granaries, poultry houses and various out-buildings.

Eminent architects prepared this monumental work for us at great expense. The central idea of the book is to enable our customers to build with utmost economy and at the same time secure the most artistic and beautiful effects and the greatest possible convenience.

By building from these plans and taking advantage of our bed-rock prices on material, you can save from one-third to one-half the usual cost. Every plan has been used many times and its practicability and economy of construction proved beyond question. The actual pictures of beautiful homes built from these plans speak for themselves. Get this great Book of Plans and save money.

The book will be mailed free on receipt of 10c in stamps or a dime, to cover cost of packing and mailing.

Great Millwork and Lumber Catalogs Quote Net Wholesale Prices

We are supplying immense quantities of all kinds of Building Material to contractors and carpenters throughout the country. Our wholesale prices save our customers over a million dollars a year. One customer alone has built 150 houses from material furnished by us. Ask for the names of near-by customers.

We Guarantee Quality, Safe Delivery and Satisfaction on Doors, Windows, Mouldings, Lumber, Etc., or Refund Your Money

$766 buys all the millwork and lumber for this comfortable 6-room cottage. Cost, complete, $1,960. Here we have a big house for little money.

DAVID WHITE COMPANY, 421 E. Water St., Milwaukee, Wis.

THE JACKSON ALUMINUM LINE LEVEL

Is designed particularly to meet the requirements of all Mechanics in building construction, especially Bricklayers, Masons, Carpenters, Millwrights, Architects, and Cement Workers.

By using the Aluminum Line Level you can take Levels in one-half the time required by the old method of the Straight Edge.

This is possible because the Aluminum Line Level weighs only one-fourth ounce and is easily and quickly attached to a line. Levels thus taken are guaranteed to be accurate on a stretched line from one to forty feet. Besides, from its construction, it can be used as a Pocket Level.

This cut shows the Aluminum Line Level, including Attachment and 40-ft. line. Complete in Leatherette Case.

PRICE $1.00, POSTAGE PREPAID

It is especially adapted for laying out foundations for buildings. It will do the work no other level will do. For sale at hardware dealers, or

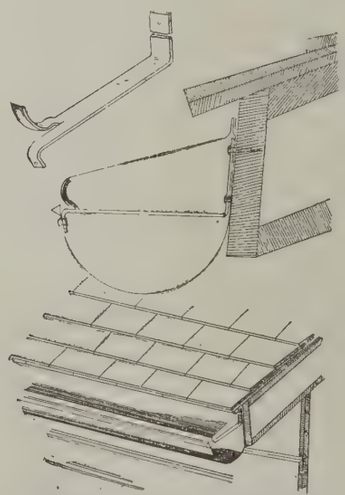
"BURMITE" ROOFING AND SIDING.

Because of unusual activity in the construction of buildings during recent years, there have been many new and improved building materials offered to building owners, architects, contractors and others interested. Important building materials are roofing and siding, and consequently considerable attention has been given to these products. Inventors and manufacturers have devised and tested various kinds of roofing and siding that have proven practical because of their economy of application and their durability of surface, one of these being "Burmite," which is manufactured by the Bermingham & Seaman Company, offices in the Tribune building at Chicago. This company is a well known paper manufacturer, and its roofing department is extensive and rapidly growing because of the success of "Burmite," which is referred to as the only material except one having a cement composition between the burlap and felt base, the felt base being thoroughly saturated with pure asphalt, and the claim is made that it will not dry out. In the center of this "Burmite" material is embedded an eight-ounce Calcutta burlap, placed there to give added strength, and carefully protected on the top and bottom by heavy layers of pure asphaltum composition, into the upper layer of which is embedded, under great pressure, and put there to stay, bird-sand for the one, and two permanent attractive natural colors of slate chips for the other style of surface covering. Further meritable features are included in the following claims:

"On account of the great resisting qualities of the slate-surfaced material, it is well adapted for the roofing of acid and fertilizing plants, chemical works, pulp mills and other buildings used for like purposes.

"This material, of either the bird-sand or the chipped-slate surfaces, when properly laid will last from 15 to 20 years, and the manufacturer guarantees it for 10 years without coating.



"'Burmite' is durable and attractive in appearance, the first cost being practically the only expense for years. Rain water is not affected by it, and immediately after the roof is laid the water running from it can be used for domestic purposes. Not only is the material adapted for flat or pitched roofs, but it can be laid over old shingles or tin.

"It is made to meet extreme weather conditions, and is not affected by summer's greatest heat or winter's most rigid cold. It can be applied in winter as well as in the summer without danger of buckling, expanding or contracting—a feature which cannot fail to be appreciated by people experienced in roofing construction.

"It requires no painting, is odorless, is easily applied, does not require an expert to lay it, is inexpensive, always remains in a flexible state and is strong and durable.

"Galvanized nails and lap cement, with instructions for laying the material, are packed in the center of each roll for all package shipments, and these articles are packed separately for bulk shipments."

CASSENS IDEAL EAVES TROUGH.

CASSENS IDEAL EAVES TROUGH
PAT. NOV. 13, '06. OTHER PATENTS PENDING.

Among the objections to the ordinary hanging gutter are the clogging with leaves, freezing when full of ice and snow, and the certainty that during the long summer the birds will build their nests in them or over them.

The "Ideal" Eaves Trough is designed to overcome these objections and an examination of the cuts will show how this is accomplished. The cover of the trough is arranged to allow the snow, leaves and rubbish to slide over the edge without entering the trough, while the water follows to the surface of the cover and drops into the trough. This insures clean cistern water. It is also noticed that sleet will not fill the trough, as the first drops freeze the opening tight shut, leaving the trough empty.

The back of the trough is nailed to the cornice while the front is supported on strong braces, which also support the cover, which is removable for painting, etc. By the cover, the protection afforded should add to the life of the trough at a minimum expense.

The Cassens Manufacturing Co. of Edwardsville, Ill., will be pleased to receive inquiries concerning the "Ideal" Eaves Trough. They are establishing agencies throughout the country.

SHEET METAL AND ROOFING HINTS.

A new catalogue is now being issued by the Willis Mfg. Co., Galesburg, Ill., on their complete line of Architectural Sheet Metal Supplies. This book contains 180 pages devoted to a complete line of cornices, skylights, metal ceilings, ventilators and ornamental and stamped metal work. It is fully illustrated, conveying to the builders these products as they appear ready for use.

The reading matter also contains valuable information for men who deal with this line of work and also those who have not as yet branched into this line.

Every man in the building business should have a copy on file for ready reference. It is sent free of charge to readers of the National Builder, so in writing for same, mention that you are a reader or subscriber.

QUALITY COUNTS IN TOOLS.

The workman who wants to make a reputation for good work and so advance to a better place at better pay, usually is very particular about his tools. He not only wants tools that are adapted to the various kinds of work, but these tools must have quality, and be so well made that they will not give out at a trying time.

In buying tools upon which so much depends in his daily work, the wise workman will place quality before price. He will buy tools that last, such as those which Braumsdorf-Mueller Co., Elizabeth, N. J., have a well-earned reputation for producing. This company has been making high grade tools for twenty years and its products are in demand throughout the land. To still further reach the man who wants the best, the company will deliver its tools to mechanics anywhere at close prices. An illustrated catalogue with prices will be sent on request. Better send a postal today. The Braunsdorf-Mueller Co. make quite a variety of tools for wood-workers such as nail sets, prick punches, bits, awls and chisels. A tool that every carpenter should have is the Dorn Revolving Mitre Box. That it stands high is shown by the extracts here given from letters received by the company. One writes: "It is the only mitre box I ever saw that I could cut a square mitre on a 12-inch board with a 24-inch saw. A saw can be used till it is worn out. For framing door and window frames it saves all laying off with a square after the pattern is made." Another says: "I have used the Dorn Revolving Mitre Box for four years. It has given perfect satisfaction. As a time-saver it is the best, and does work that cannot be done on other boxes." "It is adapted to all kinds of work." "It is superior in quality and quantity of work that can be done." Send to the company for illustrations and full particulars of the Dorn Mitre Box before deciding on what make of mitre box to buy. In writing mention the NATIONAL BUILDER.

THE "PRUDEN" PORTABLE FIREPROOF GARAGE.

In these days of the rapidly growing popularity of the automobile and the necessities in the way of convenient accommodations for housing it, the garage which we illustrate here cannot fail to prove of widespread concern. Interest attaches not only to the fact that the structure is fireproof, but is also portable, and, if necessary, can be taken apart in a few hours and re-erected on another location without loss of value. The construction is of sheet metal, there being no wooden framing whatever used. By ingenious architectural and structural methods, the siding, roofing, gables, cornices, ridges, sills and tie rods are so made as to interlock and support each other, producing a building in "knock-down" form which may be erected without skill and labor at small cost. The sheet metal is galvanized iron and the paneled siding sheets are embossed, while the roofing sheets are fluted in a way to represent tile. The doors are embossed metal, with heavy hinges and interior braces, while the windows are galvanized metal frames and the sash is glazed with wire glass if desired. The floor may be of cinders, cement, or wood, according to preference. The windows may be inserted in every other unit 2 ft. from any corner, and a single door inserted in any unit 2 ft. from any corner.

In cases where it is necessary to heat the building, the company has provided an ingenious and effective method of lining with any of the various makes of composition wall boards. The sheet metal garage shown here measures 12x20 ft. in plan, and is intended for a residential district. In the present picture are shown the purchaser's concrete floor and base. The "Pruden" portable fire-proof galvanized steel buildings are made by the Metal Shelter Company, 5-50 W. Water street, St. Paul, Minn., and the claim is put forth that this system permits of buildings being set up ready for occupancy within 48 hours after the receipt of the materials. These buildings are adapted to a great variety of uses, including outing cottages and auxiliaries, private garages, boat and bath houses, shore pavilions, hunting lodges, municipal voting booths, moving-picture show houses, farm implement shelters, dining or sleeping halls, railroad, switch or tool houses, vehicle shelters, etc., etc. A point which is emphasized in connection with the portable garage is that it is adapted to either pleasure cars, runabouts or commercial trucks, although for the latter the side walls are made 12 ft. high, and entrance doors with 11 ft. 9 in. opening. In the combination garage and sleeping apartment, which is found desirable, one end is provided with double doors and at the necessary distance back a partition is made across separating the two rooms. The rear or sleeping room has separate entrance door and windows as desired, while a single door establishes communication between the two rooms. The partitions are of the same height as the side walls and do not run to the peak of the roof. The porch may be open, screened or closed by siding sheets and have a window or doors where wanted. Another point

Learn to Fill BIGGER SHOES!

Don't be satisfied with merely pushing a saw and driving nails Be a *master* of your craft. Learn to *plan* as well as to work—to use your *brain* with the *same skill* that you use your hands.

which the company makes is that any man handy with tools can, with the aid of a helper, put up one of these portable buildings in one or two days, the only tools necessary being a monkey wrench and a screw driver. When built the house is fire-proof and neat and attractive in appearance. It is also thoroughly substantial, strong and durable.

PLUMBING GOODS.

For a quarter of a century the John Hardin Company, 4543 Cottage Grove Ave., Chicago, Ill., has been supplying their customers throughout the country with plumbing, heating and water supply material and outfits. Besides the Standard Plumbers' Supplies and Steam Goods, this company has for some time been making special efforts to introduce their complete outfits for the purposes stated.

There is a considerable advantage in this method, as it insures a harmonious assembly of fixtures and parts. Wherever possible a complete plan is sent with every outfit, thus insuring proper installation.

A very large stock insures prompt delivery of almost anything

in their line, but should special fixtures manufactured by another company be required, their trade relations enable them to fill this class of orders with little delay.

Being pioneers in the mail order line, they early saw the necessity for systematic methods of making their outfits complete, for it is annoying to find an order complete except for a few necessary fittings. The delay incident to supplying them costs the purchaser at times nearly as much as the original bill of goods.

The cut shown above illustrates one of the many combinations which may be made up from the goods shown in their catalogue, which is sent on request. Anyone contemplating the installation for a plumbing, heating or water system will do well to write them in regard to it, or send a list of material required.

IMPROVEMENTS ON THE OSHKOSH SAW RIG.

The Oshkosh Portable Saw Rig is used extensively by retail lumbermen for sawing up broken, warped or defective lumber and has been found a good investment for the operator for that purpose. The outfit can also be used to big advantage by contractors for sawing work, in the construction of cement forms, etc. This machine is manufactured with either a gasoline engine or electric motor for power and is mounted on heavy hardwood skids, so bolted and mortised together as to afford a base practically as solid as a permanent foundation, thus insuring perfect and permanent alignment of shaft, boxes and belts, an extremely important consideration in the constitution and operation of a portable saw rig.

The machine part of this rig, it is claimed, is the only one of its kind on the market today, and is fully covered by patents. The feature of this machine is the swinging arbor which is made to swing for cross cutting and held rigid for rip sawing and is controlled by a lever on the side of the machine. A lever is placed in a suitable position for operating the saw when cross cutting. These machines are equipped with sliding scale for sawing various widths, also miter device for all kinds of miter sawing. The saw is covered by an adjustable saw guard which may be set to any height. Iron saw tables are made amply large enough. Attached to the iron tables are two side tables which make the sawing of long and heavy lumber much more handy. A hook is fastened on each end of the skids which allows the handling of this rig by team of horses and may be hauled to any desired place.

The portable saw rig is made in two sizes. Size No. 1 carries 14-inch saws and weighs 1,800 pounds and has a 6 horse-power gasoline engine; with the same saws and with a 5 horse-power electric motor weighs 1,400 pounds. Size No. 2 carries 20-inch saws with a 10 horse-power gasoline engine, weighs 2,400 pounds; with the same size saws and 10 horse-power electric motor weighs, 1,600 pounds. The manufacturers of the Oshkosh Portable Saw Rig have just added a very useful improvement to their outfit, which is in the shape of an adjustable device for raising and lowering the arbor. This device can be used for jointing and dadoing and is said to be a much better arrangement than the tilting table, as it does not weaken the frame and accomplishes the same results.

In order to make this device as perfect as possible, the manufacturers have constructed a separate pair of plates; the one in the rear being adjustable so that the operator can set it the same height above the table as desired for planing. This insures a smooth piece of work so that when the operator is near the end of the lumber which he is working, it does not leave a gouge in the stick, such as the old fashioned planers used to make.

The Oshkosh Logging Tool Co., 414 S. Main street, Oshkosh, Wis., are the manufacturers of this well made portable saw rig and will be glad to quote prices and give full particulars on request.

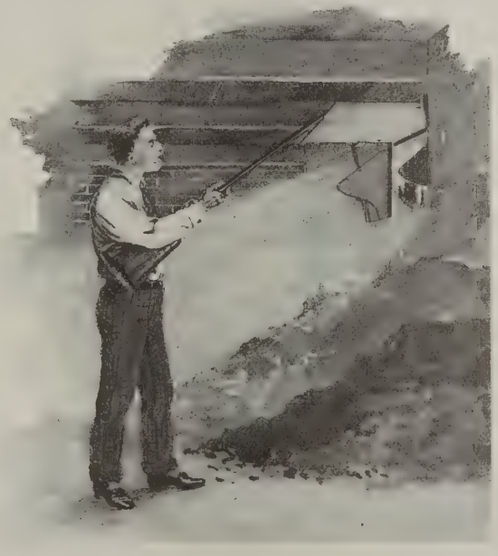
THE "E-Z-WAY" HANGERS.

The "E-Z-Way" Hanger is a recently patented device for hanging whole or half screens and storm sash on windows in either masonry or frame walls.

The hanger is applied to the screen or sash after it is fitted to the opening and is so constructed that one piece is put on the sash, the top of the hanger coming flush with the top of the screen, the other piece being applied to the outside casing, or in a brick building, to the corresponding brick mold. There is, therefore, no necessity for measuring or close fitting to be done, and in consequence, the manufacturers claim the carpenter can equip the windows very rapidly. In one case, Mr. Peters, the patentee, equipped forty-eight windows in 11 hours and 40 minutes.

The requirements of a device of this character are such that the screen must be instantly removable without the use of tools and still be secure against falling out accidentally or being blown off by a high wind.



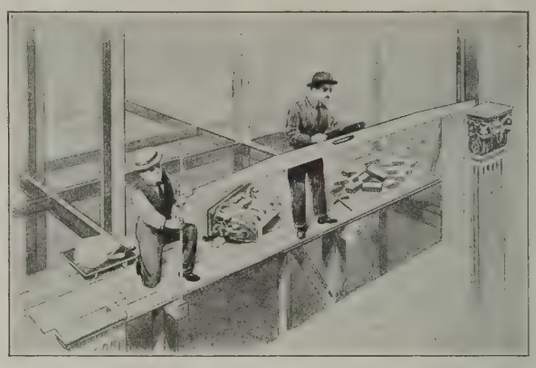
To remove the screen for cleaning or putting away for the winter, it is only necessary to swing the sash out (as shown in the cut) when the screen can be lifted up out of the hanger. While the hanger holds the screen securely in position and close against the frame, the bearings are loose enough so that one side can be removed, while the other remains in position.

The sales department of the Peters & Grant Co. are meeting with such success with the "E-Z-Way" Hanger that it has been necessary to increase the manufacturing facilities. The "E-Z-Way" Hangers are manufactured by Peters & Grant, 2218 18th St., Kansas City, Mo., who will be pleased to give further information, prices, etc.

THE WINDOW-CHUTE.

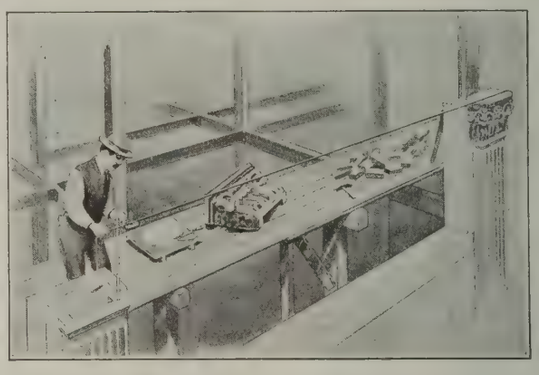
Every house must have coal, and the question of combining utility with ornament has interested builders ever since the first basement superseded the cellar.

For many years we have been satisfied to put up with the inconveniences of the hinged or removable glass sash or solid door with its awkward fastenings. A careless driver "never even knew the glass was broken and didn't leave it open anyway."



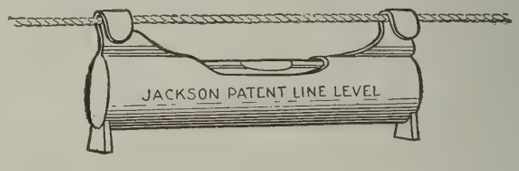
Now, however, we have a great improvement in the Window-Chute, manufactured by the Holland Furnace Company, Holland, Mich. The coal opening is no longer a black eyesore, but a clean, neat window when closed, and a wide chute when open. Just as easy to open and close, too, and no chance to be left unlocked. The manufacturers are anxious to have the Window-Chute installed in every home, new or old, and want to hear from every builder. Their literature is interesting and convincing.

DISPLACES THE OLD STRAIGHT EDGE.



The Jackson Aluminum Line Level is the most unique time and labor saving device that has been offered the trade for years. It is a radical innovation, yet so accurate, practical and compact a tool that the Bricklayers' and Masons' International Union have formally endorsed it, while unsolicited commendations of it daily reach the manufacturers from architects, engineers, contractors, builders, carpenters, etc.

In building construction it fills every requirement of the ordinary 16-foot straightedge, and an accurate level can be taken by one man in half the time formerly needed by two men.



The Jackson Line Level weighs but one-fourth of an ounce, is easily fastened to a line. It is made of the highest grade of aluminum, handsomely finished, filled with a proved level glass, and is practically indestructible. Its accuracy is guaranteed on a line stretched from one to forty feet. It can be used as a pocket level.

A double spring clamp permits attachment to any ordinary steel square, giving a perfect plumb and level. It can also be fastened to a regular pocket rule, a machinist's steel scale or a strip of wood for leveling larger surfaces.

Although on the market but a few months, orders are coming from every state in the Union, and many foreign lands. It takes the place of a surveying instrument, and is invaluable for foundation work, grading, getting angles, etc.

The outfit is placed in a handsome black leatherette, stiff case, holding the level, a forty-foot line, and the spring clamp, yet suited for the vestpocket in size. The price complete is $1. The makers are Joseph Woodwell Co., 201-203 Wood st., Pittsburg, Pa.

STANDARD SPRING FLOOR HINGES.

In the January issue of the National Builder, the Standard Manufacturing Company of Shelby, Ohio offered to pay $10.00 for one hundred words or a 100 word article, written by a contractor or builder who would send in the best arguments on why the Standard Double Acting Spring Floor Hinges are better than others.

These articles were to reach the Standard Manufacturing Company by March 15th. The manufacturers, wanting to be perfectly fair with every carpenter and builder who had sent in an article, asked three prominent carpenters and practical men located in their town to aid them in going over the large number of replies received and making a selection of the best one.

After carefully reading all of them, there were five articles which were so good that it was impossible to tell which one was actually the best and, therefore, it was decided to divide the prize between the five and a check for $2.00 was forwarded to each one of the five prize winners. These are Axel Sorensen, Chicago; O. H. Beckwith, Linton, Ind.; Walter Hawes, Lanark, Ill.; August Didier, Tarrington, Conn., and Edward A. Peacock, Cincinnati, Ohio.

In order that the readers of the National Builder may see the articles and know why the Standard Spring Floor Hinges are so well liked by the man who specifies and buys them, the Standard Manufacturing Company reproduces the five replies in their advertisement in this issue and it would be well to turn to the announcement and read it through carefully.

Amatite ROOFING

Why the Buyer of Amatite Never Complains

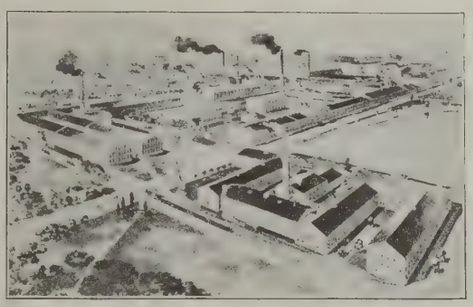
WHEN a man buys ordinary ready roofing he usually neglects to paint it and after three or four years he comes back to the dealer with a protest. It is human nature to neglect painting roofs.

When a man buys Amatite Roofing he lays it on his building and in three or four years it is still as good as new and does not need any paint. He forgets he has such a roof but no harm is done by that.

There is nothing to neglect in the case of Amatite. Amatite has a peculiar surface—a sort of plastic concrete made of pitch and mineral matter.

This surface is plastic enough so that the material can be rolled up into handy rolls in the usual manner and handled just like any other ready roofing. When unrolled on the roof and nailed down it presents to the weather a continuous surface of mineral matter and pitch. On this surface wind, rain, storm, heat and cold have little effect. Year after year it looks up to the sky undisturbed and unaffected. It costs nothing to maintain and relieves the owner from all responsibility.

Dealers can improve their business by selling Amatite and buyers make a good bargain when they buy it. The price of Amatite is less than that of most painted roofings of less weight and durability.



Sample free on request. Address our nearest office.

CORTRIGHT

Selling Talk No. 12

THE HANDSOME ROOF

The most important qualities of any roofing material are that it be tight, fireproof and durable—all of which Cortright Metal Shingles are.

But:—

Cortrights would **still** not be **the ideal roof if** they were not **also more ornamental.**

Different styles of architecture require roofs in harmony, but until the inception of Cortrights this was impossible.

Neither wood nor slate possesses this adaptability to various forms of architecture, so in the past every character of building has of necessity been adorned (?) with the same commonplace roof.

That is the beauty of the Cortrights.

We design them in several styles which make them adaptable to very artistic architectural effects.

Cortrights are therefore **handsome enough for the most elaborate building** and **economical enough for the most unpretentious structure.**

So you could **see** how suitable to any condition Cortrights are and how well they look on all kinds of buildings, we have filled two books with photographs, showing them in actual use under all conditions.

We have two of these books here for **you,** just waiting for you to send your name and address.

Send them now.

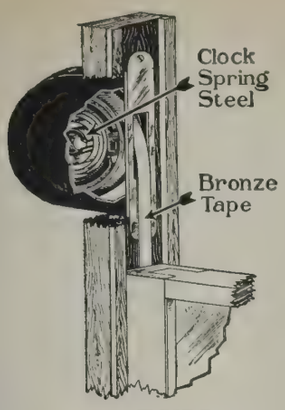
GREYHOUND HAND SAWS

SPEED & EASE
TRADE MARK.

The more you know about hand saws the more you can appreciate "GREYHOUND" hand-made hand saws, with their easy-running and rapid cutting qualities and wonderful durability. This saw will be imitated by others—but not equalled.

They are made from Bishop's Refined "GREYHOUND" Steel—a material which leads everything yet produced for use in hand saws. The purity of the steel, the toughness, the even and accurate temper, gives a saw that is the most suitable for particular work, and the most practical for ALL work where a hand saw is used. Made in both straight and skewback, also narrow patterns. Specify which you desire. Remember our warranty accompanies each saw. And the warranty means that if 30 days' trial does not convince you that the "GREYHOUND" saw is the **best** for your use, you get your money back.



Order one today and let us take all the risk. If you want literature first, write us.

U. S. Standard Cement Mixers and Block Machines

ARE THE STRONGEST LONGEST AND EASIEST WORKERS ON THE JOB

"U. S. Standard Junior Block Machine.

OUR U.S. Standard Junior and Senior Block Machines are both built upon the same basic principles, the former building a 16", the latter a 24" long block and all fractional lengths thereof. Both of these machines build hollow blocks 6", 8", 10" and 12" thick and veneer blocks 3", 4", 5" and 6" thick. The equipment also provides plates for circular blocks, angle blocks of any desired angles, porch pier blocks, chimney blocks, etc. These machines are capable of producing a greater variety of styles and sizes of blocks without additional investment than any other machine made, and for simplicity, speed, completeness, strength and beauty of blocks cannot be equalled.

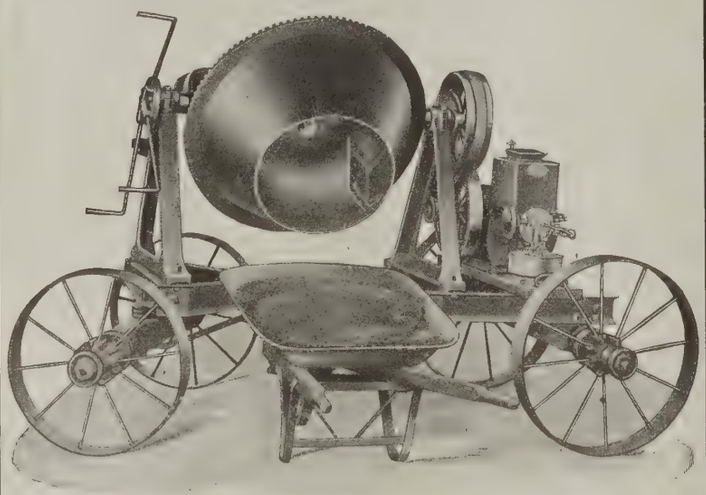
THE U. S. Standard are continuous mixers. The measuring and proportioning of the cement, sand, gravel or crushed stone is done automatically. With the U. S. Standard measuring is positive, and does not vary with coarse or fine, wet or dry ingredients.

SPECIAL FEATURES—Accuracy in measuring, correctness in proportioning and thoroughness in mixing the ingredients. All these operations are automatic and absolutely reliable. Detailed information will be furnished upon application for our Catalog No. B.

Senior No. A

THE ASHLAND STEEL RANGE & MFG. CO. ASHLAND, OHIO

AT LAST



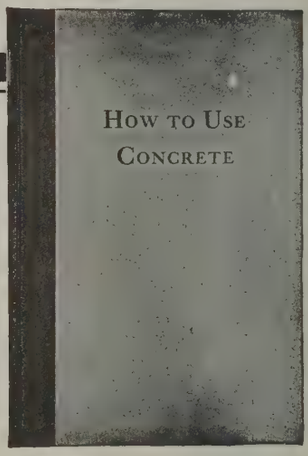
A TILTING BATCH MIXER

FOR LESS THAN THE COST OF A CONTINUOUS

THE LITTLE WONDER

Capacity, three to four feet. Turns out a better quality of concrete than can possibly be obtained by hand mixing and at one-twentieth of the labor cost.

Just the mixer for sidewalk or small foundation work, floors, etc.



Simplest mixer built. No sharp corners in drum to catch concrete. Convenient side dump. Low charge. Charges or discharges while running at full speed. Mixes wet or dry material equally well. Can be set over sidewalk forms, eliminating wheeling. Equipped with one horse power gasoline engine will turn out more concrete than machines costing twice or three times as much. Can be operated by hand.

Furnished on skids or on trucks with or without power. Write for descriptive literature. Made by the manufacturers of THE GREAT POLYGON LINE.

WATERLOO CEMENT MACHINERY CORPORATION

111 VINTON STREET WATERLOO, IOWA

HOW TO USE CONCRETE

Price $1.00

Every carpenter, builder and contractor should have this book. Over 240 pages telling how to make concrete steps, walks, balusters, laundry tubs, vases, porch columns, wainscoting, blocks, tile, brick, etc. Full instructions for making molds, proportioning mixtures and placing the concrete.

WRITTEN IN PLAIN ENGLISH

This is a book for the man who works with his hands. The instructions are clearly given and illustrated with a hundred diagrams and pictures. The book is printed in large clear type on fine paper. Bound in cement-colored cloth.

One Dollar per copy. *We pay the express.*

CONCRETE PUBLISHING CO.

501 Owen Bldg. DETROIT, MICH.

MIRACLE CONCRETE

MIRACLE MOLDS

have revolutionized pipe making. Cement pipe can be made for one-third the cost of clay.

24" concrete pipe costs 35c per foot to make.

24" clay pipe sells for $1.25 per foot.

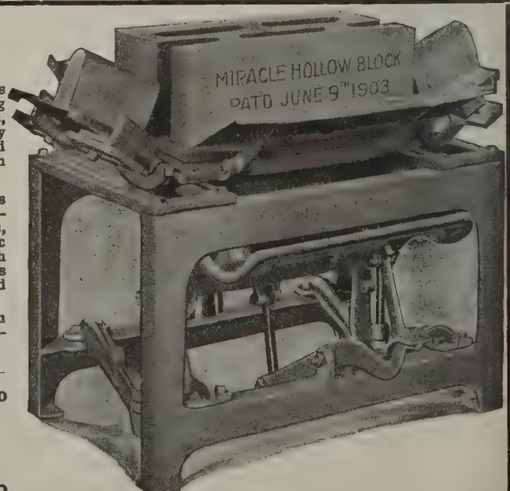
An outfit for making 24" cement pipe costs $50.00, other sizes in proportion.

Every size profitable.

ORNAMENTAL CONCRETE

Molds for Lawn Vases porch columns and balusters — also fence decorations, make up a part of the equipment of every concrete worker.

$1.50 is the cost of a concrete Lawn Vase that sells for $10.00, easily meeting the competition of iron vases of $20.00 and $25.00.



Special ornamental mold circular enclosed in every catalog.

MIRACLE BLOCK

Its distinctive feature is the two overlapping rows of air spaces, which make it the only one piece frost and moisture proof block on the market.

Handsome residences and garages, substantial factories, barns, stores, and public buildings erected with it. Block Machine is automatic, rapid and adjustable.

Exclusive protection given with each machine.

Big 128 page illustrated catalog free to those interested in the cement business.

HOW ARE YOU?

Are you making any money in your Concrete business, or do you have trouble from want of information on best methods? If you need any advice on any Concrete job, write me, tell me what you are up against, as I have been working in concrete since 1873 and should know something about the business by this time, and most likely can help you. If I cannot, I will tell you so. My charges for water-proofing formula are $2.00, or for other information, unless for large work that requires more attention. Reasonable charges for large operations. Special information on constructing dams, water works wells, method of sinking large wells and foundations in soft earth or water, Iron reinforced Concrete construction, Terazzo floors and engineering difficulties, working concrete in freezing weather, under cut work, elastic moulds for making statuary, making moulds for garden vases and getting up the patterns.

I conduct a correspondence course in Concrete by mail for a limited number of pupils for $20.00, which includes my water-proofing formulas, coloring and compound for making blocks harder after made. Get your information from one who has done the actual WORK. You will save the price of a course on your first job. Address

Ideal Concrete Machinery Plus Tycrete Products

Tycrete colors in 25-lb. Cans

Provide You an Unequaled Business Opportunity

Where can we get Tycrete Products?

THIS question was voiced by thousands of visitors at the Ideal Exhibit, during the recent Cement Shows.

"WE want to specify it," said leading architects; "We are ready to use it at once," said big contractors; "We want to handle it," said building supply men; "We want to use it in the home we are planning," said prospective builders. **Where can we get it?**

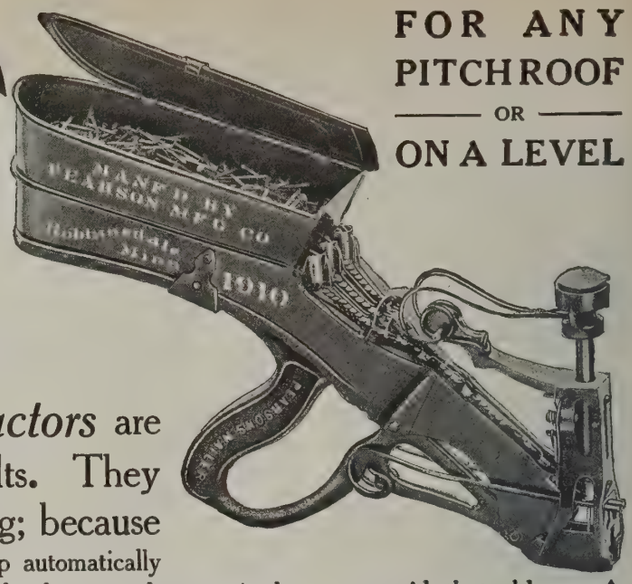
A WONDERFUL opportunity exists for progressive men **everywhere** to **fill** the tremendous, ever-growing demand for **Tycrete,** this water-proof stone of strength, density, and incomparable artistic beauty.

Concentrated Tycrete Compound in 100-lb Drums

WRITE us in regard to securing exclusive right to purchase Tycrete Concentrated Compound and Tycrete Colors, thus entrenching yourself impregnably as a leader in the concrete industry.

WE are the largest manufacturers of Concrete Machinery in the world—now in our tenth year. Our Ideal Line is the largest and most improved. It embraces the most effective and time-saving concrete machinery that has been evolved. Ideal Equipments are in every state, territory and possession of the U. S. and in 28 foreign lands.

You can start in with one Ideal machine and gradually develop a large and comprehensive plant, without sacrificing any of your equipment to the scrap heap.



Let us "answer" the questions that are in your mind It is a pleasure for us to answer letters and furnish information concerning the Ideal line.

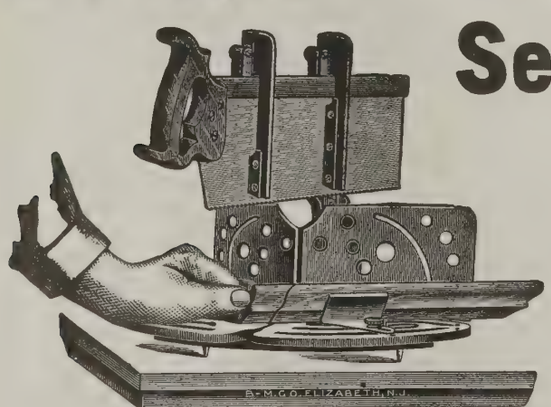
Carry the Nails in
A PEARSON NAILER
And Do Your Shingling Easier and Quicker than in the old way

FOR ANY PITCH ROOF — OR — ON A LEVEL

Thousands of Carpenters and Contractors are now using this Nailer with most satisfactory results. They like Pearson's Nailer because it is light and strong; because the nails can be dumped into it any old way, and they will always drop automatically into place, ready to be driven in with the hammer; because it does away with that old, unsanitary way of carrying the nails in the mouth; because more nails can be driven with it in a shorter time; because the operator can wear gloves or mittens when shingling, and because a Pearson Nailer will pay for itself on one fair sized job.

Pearson's Nailers are made in two sizes, the Blue Nailer is for common 3d No. 14 wire nails and the Red Nailer is for Galvanized 3d No. 13, 1¼ in. wire nails.



Order one now, stating Nailer wanted. You are taking no risk, for we refund your money if not satisfied after a trial. Price **$5.00** each, and **we will pay express charges if ordered now,** before our big spring rush sets in.

Write for circular "N" and use a Nailer on your next job of shingling.

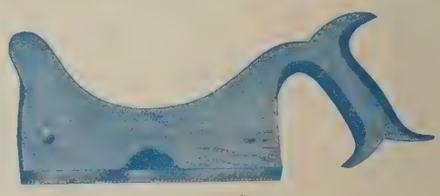
ATKINS SILVER STEEL SAWS



WE HAVE said a great deal about ATKINS SILVER STEEL HAND SAWS. We have told you how they are made and what splendid service they are giving others and what they will do for you. Now, we want to show you a few pictures taken from photographs of the Saws themselves, because we know you will be interested. We can't show you the whole line, for we make hundreds of different kinds of SILVER STEEL SAWS for all purposes.

But look at this Hand Saw. Ain't she a beauty? Is there not something distinctive and individual about it? Look at its graceful lines and the finish and the perfection hardwood handle. Does it not look like a Saw that would give results? This is our No. 53 and it comes in all sizes and points. There are a number of other patterns, styles and finishes, many of which are described in our Saw Sense Book.

Here is one of our finest Back Saws. Does it not look as though it would do the business? The blade is of SILVER STEEL and will, therefore, run a long time without filing the little fine teeth. The back is of heavy stiff steel and clamps the blade like a vise. The handle is of applewood, easy grip pattern. We make several styles of Back and Mitre Saws.

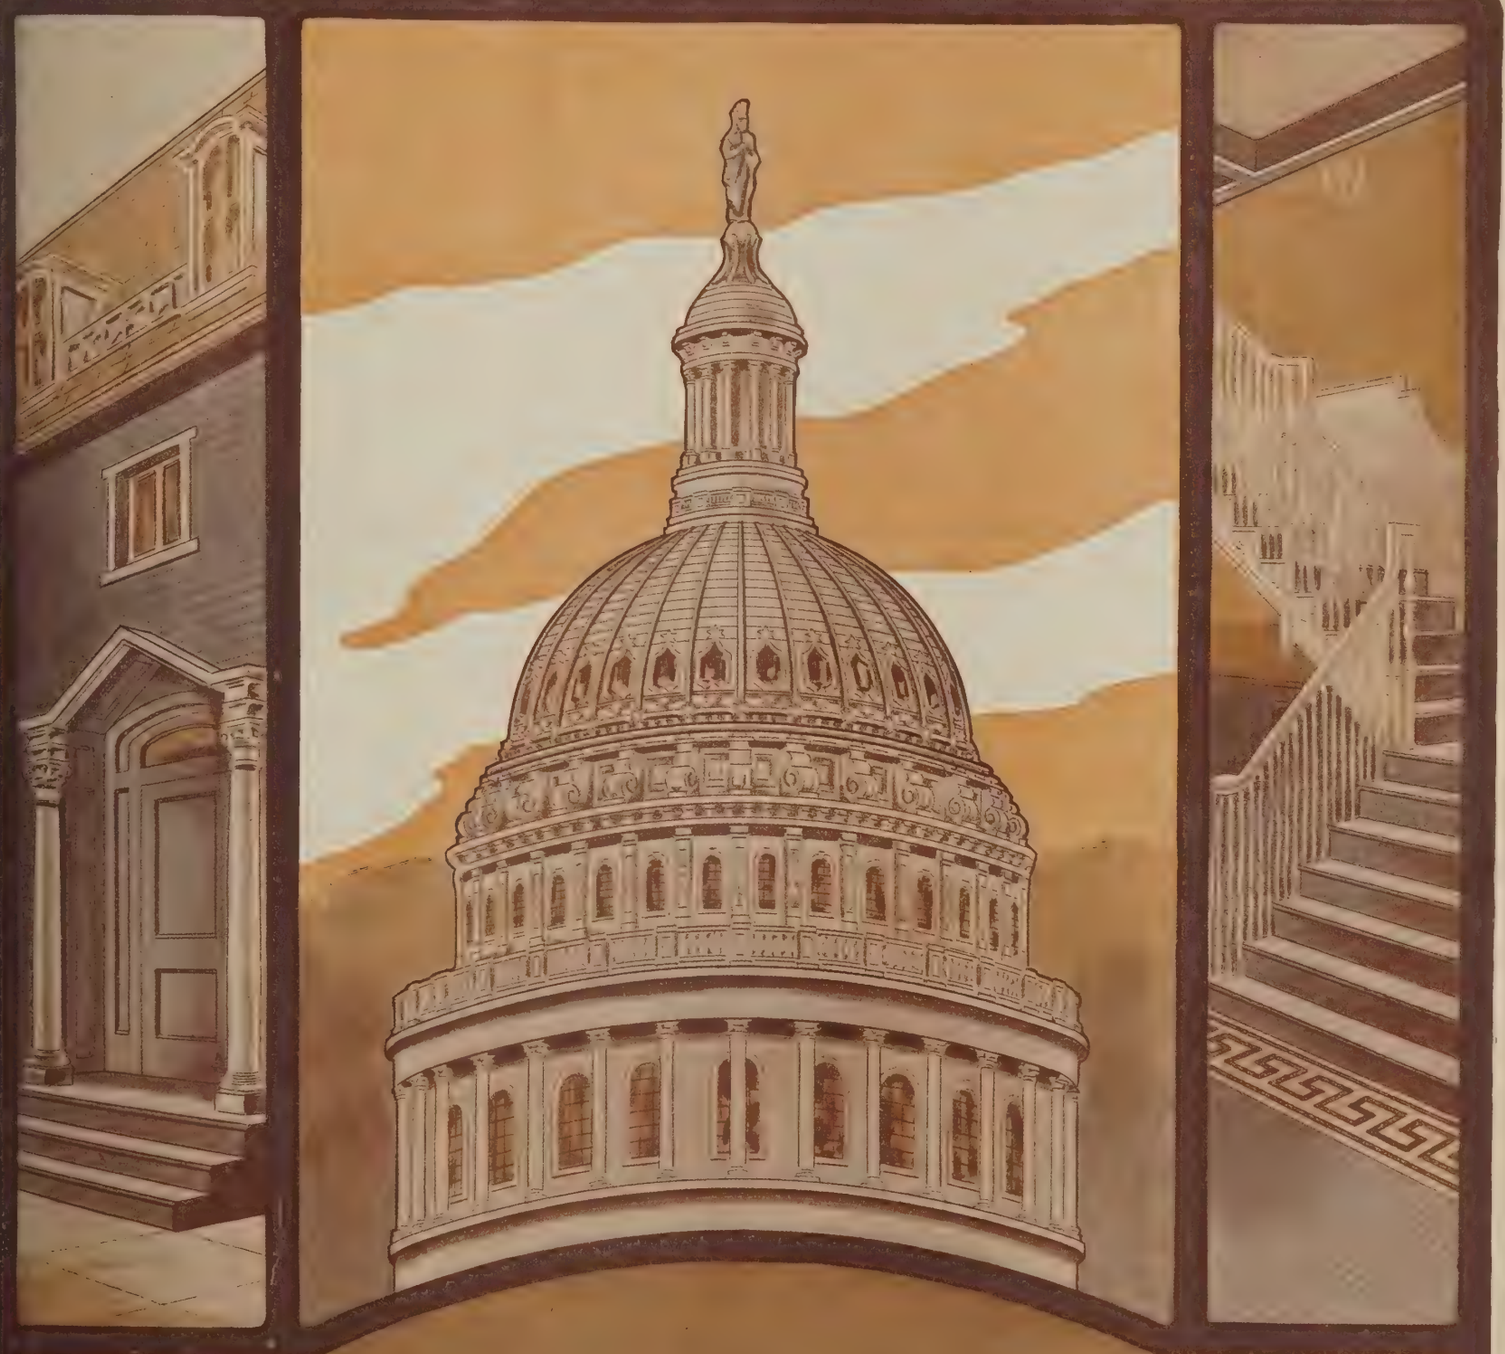
This Stairbuilders' Saw is a mighty handy tool. The blade may be regulated so as to cut any depth, assuring absolute uniformity.

This is one of our most popular styles of Compass Saw. We call it our No. 2. The blade is of SILVER STEEL and is, therefore, very hard and tough, but not brittle, and it is difficult to twist these blades out of shape. The handle is of carved and polished applewood.

This is our No. 3 Nest of Saws with Nail Cutting Blade. They are indispensable to every carpenter. The set consists of a Compass and Keyhole blade, together with a hardened steel metal cutting blade, all of which attach to an adjustable handle. The next time you need a Compass or a keyhole Saw, you had better pay a little more for the No. 3 Nest and thus secure the advantages of the Nail Cutting Blade.

ATKINS ALWAYS AHEAD

HOW TO BUY THEM



ATKINS SILVER STEEL SAWS are for sale by most first-class Hardware Dealers, but if your dealer does not sell them regularly, he will be glad to order for you from his wholesale house. If you have any difficulty in getting them in this way, please let us have your dealer's name and we will see that you are taken care of.

OUR FREE OFFER We are still compiling our list of carpenters and if you will send us ten cents to pay postage, we will forward with our compliments, a fine strong nail apron, together with our Saw Sense Book or Carpenter's Catalog, our monthly time book with scale of wages and some mighty interesting information in regard to High Grade Saws. Write to-day and secure this valuable package

DISSTON

INSULATE SCREW DRIVER

This tool is designed expressly for Electricians' use.
The blade of crucible steel, hardened and tempered, is embedded in a handle of hard rubber of a texture that eliminates brittleness. It *will not* work loose.
The rubber handle is milled grip with projecting rings which prevent the hands from slipping down onto the blade.
The hard rubber handle acts as insulation.
The Disston Insulate Screw Driver is something new.
Most practical electricians' screw driver ever made.

AUGER BIT ESSENTIALS

The Seventh Feature contributing to the high quality of

RUSSELL JENNINGS BITS

is the care exercised in

INSPECTION AND TESTING

After sharpening, the bits are carefully inspected, so that perfect bits only go on the market. They are then tested individually in all kinds of wood, the bit being motor driven. Electric measuring instruments indicate accurately the power necessary. In this way we know just what our bits will do before they leave our factory. The tests guide us in our constant effort to improve our bits.

BISHOPRIC WALL BOARD AND SHEATHING

ANY WEATHER is "Good Building Weather" when you use Bishopric Wall Board as a substitute for lath and plaster. It is cheaper and better and does away with all delays in building. It is nailed to studding dry, ready for immediate application of paper, paint, burlap, or any other kind of decoration.

FOR WALLS AND CEILINGS

Bishopric Wall Board Easily Applied

This substitute for lath and plaster is made of kiln-dried, dressed lath, imbedded in hot Asphalt Mastic, surfaced with sized cardboard and cut at the factory into 4x4 ft. sheets, which are easily and quickly nailed to studding, ready for immediate application of wall paper, paint, burlap, or other decoration.

It is applied dry, is guaranteed not to swell, shrink, warp, crack, flake or blister; is clean, sanitary, and odorless; is proof against moisture, cold, heat, and vermin; saves fuel in winter and keeps out summer heat; also deadens sound.

It is suitable for dwellings, factories, new partitions in old buildings, finishing attics, porches, laundries, cellar ceilings, garages, etc.

Applied Dry Winter or Summer

Showing Construction of Bishopric Wall Board

PRICE WALL BOARD AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6.40 per crate, or $2.50 per 100 square feet, f. o. b. New Orleans, La., Cincinnati, or Alma, Mich. We ship from nearest point.

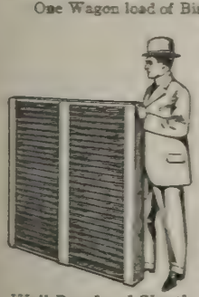
Cheaper Than Lumber. Saves 75% on Labor. Does away with Building Paper.

BISHOPRIC SHEATHING

Ideal Material for Cement Buildings or Stucco Exteriors. Proof against Dampness.

Bishopric Sheathing is made of same materials as Wall Board, but finish is not necessarily so fine, therefore costs less. It is of uniform thickness, insuring a perfectly even surface when applied.

Bishopric Sheathing is nailed to studs, with lath and asphalt side exposed. Over laths, weather boards are nailed or cement applied.



Showing construction of Bishopric Sheathing

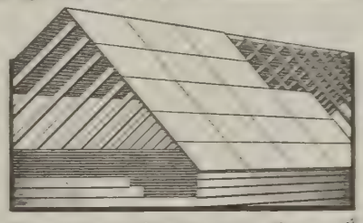
Arrows point to Asphalt Mastic into which lath are imbedded

Bishopric Sheathing makes a more solid and substantial wall than lumber. There are no gaping joints; no widening cracks due to shrinkage; no knot holes.

The Asphalt Mastic in Bishopric Sheathing is a non-conductor, moisture cannot penetrate it. It is proof against vermin. The pests cannot bore through the tough, gummy Asphalt Mastic. In applying weather-boards over the laths, dead air space is left between the laths forming splendid insulation. Does away with the expense of building paper and cost of its application.

One Wagon load of Bishopric Sheathing covers an area from six to ten times as great as one load of lumber—a tremendous saving in hauling. Five thousand feet can be hauled in an ordinary wagon.

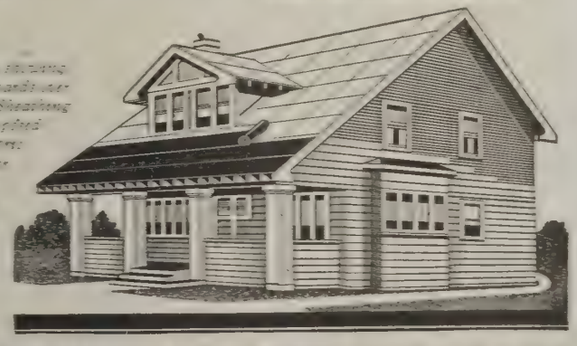
Wall Board and Sheathing are shipped in crates



The cost of applying Bishopric Sheathing is but $2.50 per 1000 feet—A SAVING OF ABOUT 75 PER CENT. Furthermore, 1,000 square feet of wood sheathing covers but 750 feet of surface, 20% less being due to tongue and groove. In Bisnopric Sheathing 1,000 square feet covers 1,000 square feet of space

In applying ordinary lumber, heavier scaffolding, more tools and greater scaffold floor-space are required. In applying Bishopric Sheathing, one man drives a few nails in each sheet; a common laborer or boy can finish the nailing.

Bishopric Sheathing insures comfort during the construction of the building. As soon as the building is closed in with Bishopric Sheathing, the men may work in comfort on the inside during bad weather, finishing the outside on suitable days. This insures continuous work, without loss of time, enabling the contractor to hold his men and complete the work in the least possible time



Bishopric Sheathing is used with equally splendid results under flooring and as a substitute for roofing boards. Used under floors, it serves as a sound deadener and keeps out dampness; used under the shingles, it keeps out summer heat.

ITS MANY USES—Bishopric Sheathing also is used with excellent results as a lining for dairy barns, ranch houses, poultry houses, driving stables or any out-door building where protection from the elements, Summer or Winter is desired.

Showing Exterior Sheathing in position ready for Weather Boards or Cement Stucco

Bishopric Sheathing is the ideal material for cement exterior or stucco work. Cement firmly adheres to the laths and Asphalt Mastic and makes a solid, smooth exterior. For factory or residence this form of cement or stucco construction is the cheapest and best known.

Showing Bishopric Wall Board and Exterior Sheathing both side applied also Bishopric Roofing over Sheathing forming weather and fire resisting roof

PRICE SHEATHING AND SHIPMENT — Crate of 16 sheets, covering 256 square feet of surface, $6, or $2.35 per square of 100 square feet, f. o. b. New Orleans, La., Cincinnati or Alma, Mich. We ship from nearest point.

Write for Descriptive Booklet and Samples of Bishopric Wall Board, Bishopric Sheathing and Bishopric Roofing—All will be sent free.

UTILITY WALL BOARD

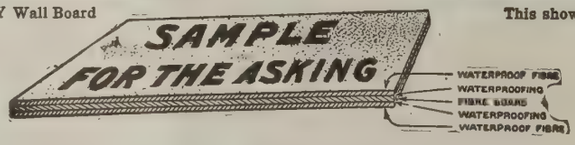
A Fibrous Water-Proof Board Made in Convenient Widths and Lengths

To be Used Instead of Lath and Plaster in New Building or Repair Work

Make your Garage Warm by Lining with UTILITY Wall Board

Mr. Contractor

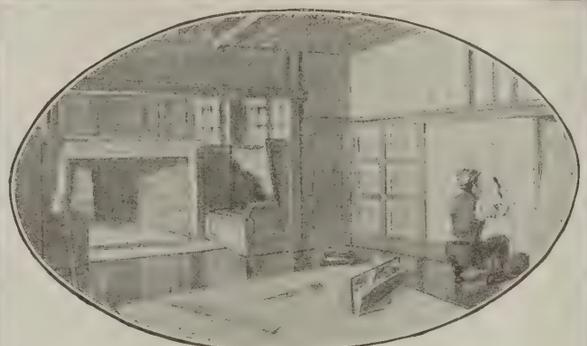
This is your chance to make more money and finish your jobs quicker. UTILITY WALL BOARD is right in quality and price. It has come to stay and is rapidly taking the place of lath and plaster.



Every up-to-date contractor and builder should get samples of UTILITY WALL BOARD at once. There are hundreds of places it can be used with a profit to you and satisfaction to the owner.

Remember that all delays of the plasterer are a thing of the past for those who use this modern building material.

This shows how an Attic looks after being finished with UTILITY Wall Board.



Utility Wall Board is better than lath and plaster. It saves the user a lot of money besides giving him a handsome, durable job. Utility Wall Board can be painted and decorated with the finest results. Utility Wall Board is being used in both small and large buildings. Everyone likes it.

Write Now for FREE Sample and Prices

Utility Wall Board can be applied by the carpenter—nailed right to the studs—easy and clean to handle—cuts with a saw—fits any space and can be put on in winter or summer—no waiting for plaster to dry—no cracked walls—no dirt—no ruined decorations—warm in winter and cool in summer

THE HEPPES COMPANY, 4502 Fillmore Street, Chicago, Ill.

YOU CAN SAFELY RECOMMEND

Compo-Board

It makes the best walls and ceilings. Dry, warm, fire-resisting and moisture proof.

Compo-Board walls will outlast lath and plaster; will not crack, crumble or fall off. Can be easily put on without waste of time waiting for plaster to dry.

They always look well. No ugly blotches where moisture has gathered. No unsightly scars where the walls have been patched. Will take paint, paper or kalsomine perfectly.

In addition to being a perfect wall lining, Compo-Board can be used as a back plaster for partitions, for lining summer cottages, barns and poultry houses. It has many uses around the house and in the office and factory.

Compo-Board is made of strips of thoroughly dried lumber matched together and well glued. These strips are then covered with a specially prepared moisture proof paper, which is cemented under intense heat heavy pressure. This makes a wall lining that will last indefinitely.

Can be had in strips four feet wide and one to eighteen feet long, any length you want in even feet.

SEND FOR SAMPLE AND BOOKLET

Fully describes Compo-Board and its many uses and advantages, and the sample will show you what it is.

RED GUM

(AMERICA'S FINEST HARDWOOD)

A RED GUM BANK AND OFFICE BLDG., THE LINCOLN BANK BLDG., LOUISVILLE, KY.
Messrs. McDonald & Dodd, Architects.

"RED GUM is the logical wood" for a superior result in **Interior Trim** in costly buildings in which ***money is not intended to be wasted*** **AS WELL AS IN MODEST HOMES.** The interior trim of the fine building shown at left is **RED GUM** and the result is a structure notable for its **beautiful and thoroughly satisfactory** woodwork.

SAP GUM

Another Valuable Lead for Wide-Awake Builders

SAP GUM is of course a part of the same tree from which RED GUM comes. As the tree grows the sap changes to red, and SAP GUM has most of the excellent qualities of RED GUM.

SAP GUM, which was formerly used for the manufacture of boxes, in grades that were suitable for much better purposes, is now recognized as a wood which is much too valuable for such purposes, and is being rapidly diverted into its legitimate channels.

SAP GUM is excellent for interior work, as it takes stains and varnish beautifully and there is no exaggeration in the statement that it is the best wood obtainable for

White Enamel Interior Trim for Colonial Houses

SAP GUM finishes with *absolute smoothness*—a rare virtue.

SAP GUM takes glue as well as any wood manufactured.

SAP GUM at present price is a remarkable investment.

Builders desiring to see samples of ***Red and Sap Gum,*** *both rough and finished, or who want prompt quotations on selected* ***Red and Sap Gum,*** *should* ***write at once*** *to any or all of the following firms:*

LAMB-FISH LUMBER COMPANY . . . . . Charleston, Mississippi

JOHN BOYLE & CO.'S Awning Stripes have been the Standard for 50 years.

Time-and-weather test is the *real* roofing test.

You want to be sure *before you buy* that your roofing will stand this vital test. The only way you *can* be sure is to know what the roofing is made of.

Genasco

the Trinidad-Lake-Asphalt Roofing

is free from mystery and deception. It has the life that only natural asphalt can give roofing to make it thoroughly and permanently waterproof.

The natural oils in Trinidad Lake Asphalt give it this resisting life; and they do not dry out of Genasco like the volatile oils in artificial asphalt roofings, which leave them to crack, crumble, and leak. Genasco resists rain, snow, sun, wind, heat, and cold—and it lasts.

The Kant-leak Kleet not only makes seams absolutely water-tight without cement—it prevents nail-leaks, and gives the roof an attractive finish.

Ask your dealer for Genasco mineral or smooth surface roofings with Kant-leak Kleets packed in the roll. Fully guaranteed. Write us for samples and the Good Roof Guide Book.

Vulcanite

Standard for 60 Years

Here's a roofing that has passed every test that *proves* good roofing—that has been made and sold on merit for sixty years.

Think of the experience behind it. Consider the number of highest awards it has received at expositions. Study the points that make it so good.

Made from the highest priced mineral compound known and the purest felt obtainable, in our own mills where we can watch the manufacture from start to finish. We use no paper or cheap filler—just the pick of materials that make roofing durable.

VULCANITE roofing will not freeze or crack—climatic conditions have no effect whatever. It's the most extensively used roofing in the world today because—there are reasons.

VULCANITE CRYSTAL SPAR SIDING

A new building material that has made good for use on Bungalows, Summer Cottages, Residences, etc. Fire and water-proof. Easy to apply, never cracks and saves painting and building paper. Used with clap-boards, this siding makes a substantial and well appearing building, besides effecting an all-around economy. Packed in rolls, 40 feet 6 inches long by 32 inches wide.

Send For Samples

To enable the carpenter, builder and contractor to be his own judge and jury of VULCANITE Roofing and VULCANITE Crystal Spar Siding we will send liberal samples free upon request. We merely ask you to examine it—to test them in competition with other brands—and to read our literature. Send today.

GRIMM MFG. CO.:

Gentlemen—The Combination Woodworker which you sold me a short time ago, I am very much pleased with. It is the best wood-working machine of its kind I ever saw. If I knew I could not get another machine like it, I would not sell it for triple its value. Wishing you all success, I remain, yours truly,

(Signed) GEORGE WEGMAN.

Built for Service

CONTRACTORS AND BUILDERS ATTENTION

Galloway Engines are made in all sizes from 1¾ to 28 H. P. They run on gasoline, naphtha, kerosene or distillate. We are furnishing complete mixing rigs and our price means a big saving of money to you—$50 to $300, depending on the engine you buy. You have the privilege of trying the outfit 30 days. If it is in any way unsatisfactory we refund your money with interest and pay freight both ways.

The Galloway Gasoline Engine

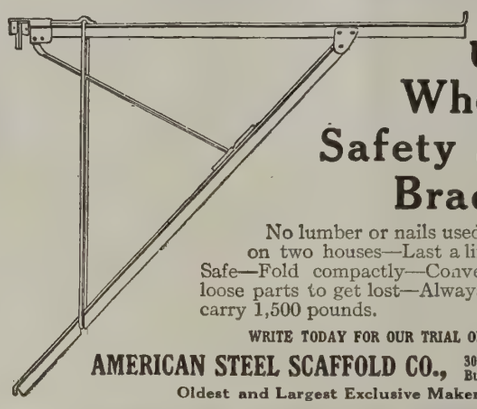
SIMPLEST ENGINE BUILT

Only four things to do:

Turn on the switch, turn on the oil, turn on the gasoline, give the flywheel a start and the Galloway will go right along all day without further attention. It is ideal power for a small shop, and it's got the capacity to take care of your growing needs for operating planers—matchers, lathes, saws and concrete mixers.

The Galloway has been classed as a standard, high grade engine for fifteen years. Over 4,000 n use in Iowa alone. Thousands in every other State and Territory.

If you try the Galloway engine, you will find that it is not overspeeded. Remember, the bore and stroke count, and you don't have to drive your engine faster than you ought to drive it to get the rated horse power. Rated by actual brake test.



On the larger sizes, if it is not entirely convenient for you to pay all cash, we will take your note for the balance at the regular rate of interest for six months.

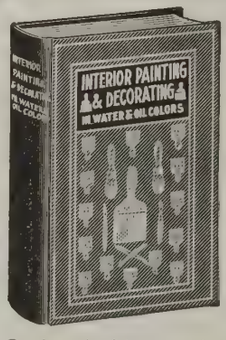
The price given is for the five-horse power only, but we make these engines in seven sizes.

Ask for free information on stationary and portable gasoline engines from two to twenty-eight horse power. We make the best, and we price them at a reasonable figure. Write today.

The William Galloway Company, 1695 Galloway WATERLOO, IOWA

Save Money

Use Wheeler Safety Scaffold Brackets



No lumber or nails used—Pay for themselves on two houses—Last a lifetime—Self-locking—Safe—Fold compactly—Convenient to handle—No loose parts to get lost—Always ready for use—They carry 1,500 pounds.

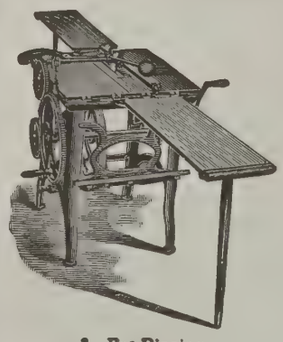
HODGSON BOOK CO.

THE RED BOOK SERIES OF TRADE SCHOOL MANUALS, by F. Maire, Director of the Chicago School of Painting, Decorating and Paperhanging

6 volumes, 16mo, Full Cloth. Each Illustrated. Price each.....**$0.60**



The author being acquainted with many of the European and nearly all of the American Manual Training Schools, where painting is taught, feeling the need of a treatise which would help the student or instructors in imparting knowledge, has prepared the following manuals:

(1) Exterior Painting, Wood, Iron and Brick.
(2) Interior Painting, Water and Oil Colors.
(3) Colors, What They Are and What to expect From Them.
(4) Graining and Marbling.
(5) Carriage Painting.
(6) The Wood Finisher.

The arrangement of the above volumes is such that the student is gradually advanced upon the branches treated and the questions at the end of each lesson will become an index of reference which he will find useful. Instructors will surely welcome these valuable manuals, as they will save them numberless repetitions. The student who cannot leave home to attend a school will find his task of learning the various branches treated greatly facilitated by procuring these volumes.

"It runs like a sewing machine and does the work perfectly"

Said MR. PINNICK, of Richmond, Indiana

Richmond, Ind., March 1, 1911.
The Sidney Tool Co., Sidney, Ohio.
Gentlemen—Inclosed find check in full for my account, less three dollars for expenses which you ordered me to deduct. This machine is as represented, if not better. To say that I am pleased is putting it very mild. It runs like a sewing machine and does the work perfectly. Yours truly,
HARRY PINNICK, 112 S. 10th St.

Sixteen woodworking machines, embodied on one base, comprise the No. 14 FAMOUS Universal Woodworker

This machine has a **record**—over six hundred in use and never one "kick." The FAMOUS is the only **perfected** Universal Woodworker; the money you pay for others is paid for **experiments.** Competitors can imitate **only** our advertisements. They cannot duplicate—or even imitate—our machine or the work it does. The FAMOUS was the **first** Universal Woodworker; it was the **first** on which sixteen different kinds of work could be performed; it is the **only** woodworker which can be relied upon to give first-class service. **Play safe.** Don't experiment. Buy a FAMOUS when you buy a woodworker. We give a broad-gauged guarantee that protects the buyer as long as he may have the machine—and which protects any person who may buy it from him.
Write for literature and liberal terms.

Above illustration shows a No. 14 FAMOUS Universal Woodworker in actual operation. It does sixteen different kinds of work.

COPYRIGHTED, 1909, BY THE STANLEY RULE & LEVEL CO.

Stanley Tools

Among the gauges shown herewith we call particular attention to—No. 94, a new BUTT GAUGE.

It has two steel bars. To one are affixed two steel cutters for use when gauging for doors with rabbeted jambs. This bar may be reversed for gauging from the casing (whether of the moulded form or flat) on doors which have a strike strip nailed on after the door is hung.

The other is fitted with a steel cutter to gauge for the thickness of the butt.

The two ends which are parallel—are at right angles to the bottom, and as one end overhangs the bottom slightly, it can be used as a square from which to mark at right angles to the casing, as shown in the cut.

This tool is convenient for carrying in the pocket, and is so constructed that the bars cannot fall out.

"IT'S A SCRAPER BUT IT WORKS LIKE A PLANE"

That is what the many satisfied Contractors and Builders who are using **The Boss Improved Floor Scraper** say.

THE BOSS has double swivel allowing the knife to be set in any position. Gauge can be set for any thickness of shaving and keeps knife from making depressions in floor. Gives knife double support. The pear-shaped wheel which is in the gauge is attached to the gauge in front so that when the scraper is let down to take shaving, it lets the knife down gradually and prevents the knife from making a deep cut. With this gauge and wheel attachment the knife will leave no mark. Impossible to do poor work. Adjustment simple—positive. Gauge can be removed instantly. Standing attachment cleans wheels and takes off the rosin when working hard pine. Prices very low. Write for descriptive circular "N"

GEORGE J. KEPPLINGER, - Dwight, Illinois

No. 347. Combination Saw and Dado Machine.

Looking for a Modern Saw Bench?

The above cut represents our new Combination Saw and Dado Machine.

The **Frame** is quite substantial, with closed front.

The **Ways** adjust for depth of cut, and

The **Carriage** moves on rollers having ball-bearings.

The **Saw Mandrel** runs in self-oiling boxes, and is brought into the work by a foot treadle, thus leaving both hands free to handle the work.

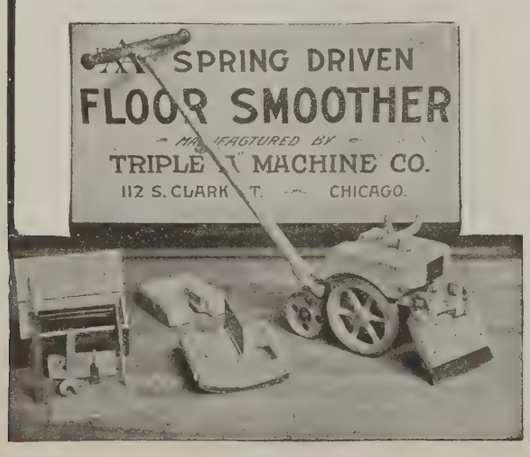
The DAISY MFG. CO. South Bend, Ind.

DAISY MFG. CO., SOUTH BEND, IND.



When You Buy a Floor Surfacing Machine
BUY A GOOD ONE—IT PAYS!

The Triple "A" Spring-Driven Floor Smoother combines the advantages of the hand machine and the power machine. No more expense than the former, yet has the capacity and ease of operation of the latter.

No wasted energy pulling a dead weight.

About half of all the Triple "A"s sold have been bought by owners of dead weight machines. What's the answer?

"Get the best first and save extra expense."

The Triple "A" to be appreciated needs only to be seen in operation.

For advertising purposes we will give a special discount on the first machine sold in each town.

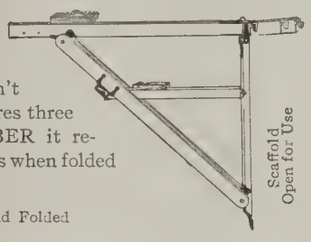
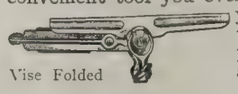
TRY THEM ALL - KEEP THE BEST
TWILL BE A WEBER IF GIVEN A FAIR TEST

Weber Tools and Appliances
Stand for Themselves—

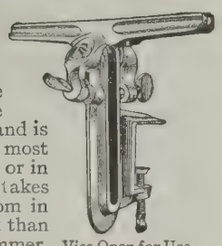


Try the **WEBER** Double Acting **Floor Scraper**

on the same floor with all others on the market. If it is not handier, more time and labor saving and more durable—if its work is not better all thru—return it at our expense.



Cabinet Scraper
and sander—a tool which every cabinet maker, carpenter and painter should have. It is recognized as the most valuable article of its kind ever invented. Ask you dealer. If he does not handle it, I will ship direct or thru him.



Double-Folding Scaffold Bracket
Is adjustable to any building. Can't swing. Where it ordinarily requires three rows of scaffolding, with the WEBER it requires only two; 12 of these brackets when folded take up space only 3′x4′x6′.

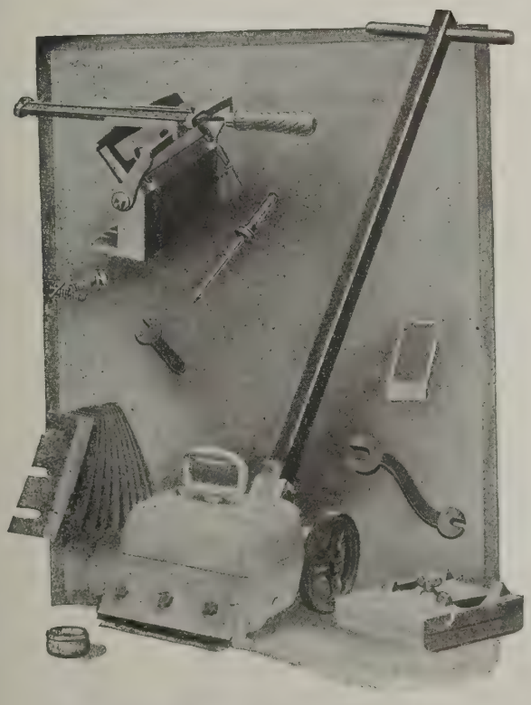
Scaffold Folded

Folding Saw-Filing Vise
Also ask your dealer to show you the WEBER Folding Saw-Filing Vise—the Saw Vise you want. Has a rigid grip and is almost noiseless. You will find it the most convenient tool you ever had on a job, or in your shop. It takes up no more room in your hand box than an ordinary hammer.

Vise Folded

Vise Open for Use

Wax Polishing Brush
and sander. Brush sits square and even and imparts a high gloss. Sand-papering block admits turning paper one-half around, greatly lengthening its life.



Write for Free Trial
I want you to try the Weber Double Acting Floor Scraper on my 5 to 10 days free trial offer.

JOHN F. WEBER, President

Weber Manufacturing Company
661 71st Ave., West Allis, Wis.

WHAT IS THE ANSWER?

When nearly every mail brings letters such as are reproduced below—what does it signify? Isn't it almost positive proof that the **Acme Floor Scraping Outfit** does the work? Read these letters—they are simple expressions from contractors who have accepted my free trial offer. They aren't old and shopworn letters either. Look at their dates.

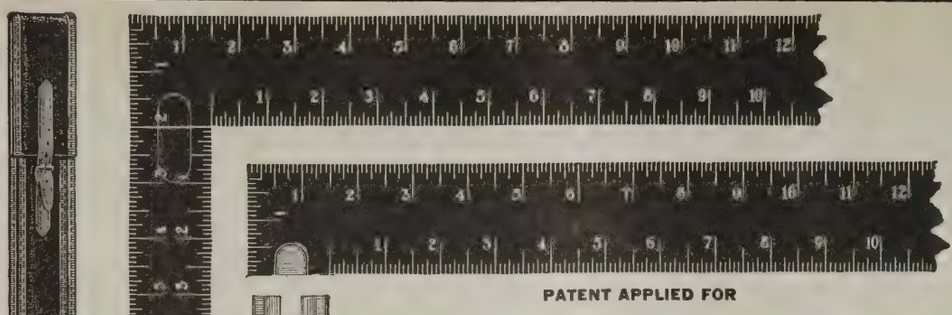
Carrollton, Ill., March 18, 1911.

Jos. Miotke.
Dear Sir:—Enclosed find draft in payment for the floor scraping outfit you sent me on trial. I tried the machines and found that they do the work perfectly. I am well pleased with them and if I see anyone looking for a floor scraping outfit I will certainly recommend yours.
Yours very respectfully,
James C. Sackett.

Williamsport, Ind., March 21, 1911.

Joseph Miotke, Milwaukee, Wis.
Dear Sir:—I set the floor scraper to work last Saturday and must say that it is satisfactory in every particular. Inclosed you will please find my check for same.
Respectfully,
B. F. Bush.

Eveleth, Minn., March 29, 1911.



Joseph Miotke, Milwaukee, Wis.
Dear Sir:—Enclosed find check in payment for the floor scraping outfit sent me on trial March 2nd. I gave it a hard trial on both old and new floors and concluded that it was just the outfit that I need for my work.
Respectfully,
Chas. H. Rutty.

Don't you think it advisable for you to give my outfit a trial? It don't cost you anything to try and if the machines are not satisfactory, just send them back after you have used them for one week and I will pay the charges.

Let me send you full details of this offer. It means money to you, so write today.

JOSEPH MIOTKE, 249 Lake Street, MILWAUKEE, WIS.

PATENT APPLIED FOR

NICHOLLS
NEW TAKE-DOWN
SQUARE

Guaranteed Accurate and Will Remain So

The main feature of our new Take-Down Square is that it will always stay true; it is so constructed that the tongue is held down into beveled bearings by a spring, and these bearings are made so as to take up the constant wear which comes in taking square apart and putting it together, thereby producing constant accuracy.

SOME OF ITS GOOD POINTS:

1. Convenient to carry.
2. Each time Square is taken apart and put together the wear produces a firmer joint, thereby insuring constant accuracy.
3. No screws used; locks automatically.
4. The only Take-Down Square which leaves no part of the Tongue attached to body, when separated,
5. Occupies smaller space than any other Take-Down Square manufactured. 2″x24″.
6. Instantly taken apart and put together.
7. Rust-proof canvas case with each square.

Manufactured in Nos. 3 and 100 Standard; also No. 100 Rafter Framing, giving lengths of common, hip, valley, and jack rafters for 17 different pitches of roof.

ALSO THEIR CUTS

If your dealer will not supply you we will gladly ship you one of these express prepaid upon receipt of price.

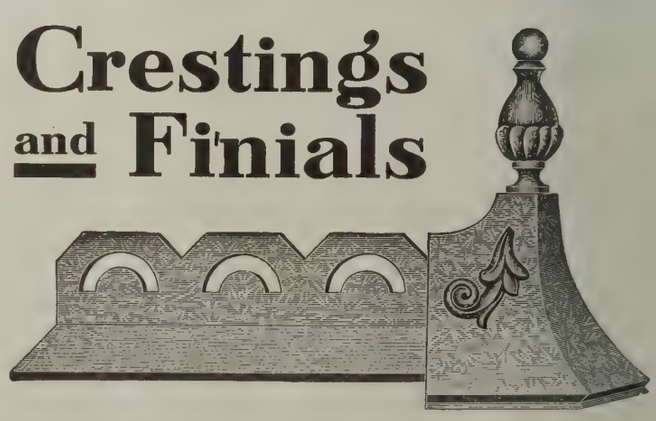
NICHOLLS MANUFACTURING CO., Ottumwa, Iowa

The NOVO Engine

The NOVO gasoline engine in four sizes from 1¼ to 6 H. P. is especially adapted for use on portable and stationary machinery of every kind. It is **very light in weight, absolutely self-contained,** gasoline being in the base and the water contained in tank around the cylinder, which is guaranteed not to burst from freezing. The **upright form** and **low height** for vertical engine, and **small size of base,** adapts it for use on any machine requiring a self-contained power.

We should be pleased to furnish manufacturers or users of portable machines of any kind with full information, weights, and sizes of our different engines.



We make **three sizes** of **gasoline hoists** for builders' use.

MAKE THE ROOF FIRE-PROOF

J-M Transite Asbestos Fire-Proof Shingles offer the most perfect fire protection known, because they are made of Asbestos (rock) fibre and Portland Cement—both minerals. Are absolutely proof against fire, water, acids, gases and chemical fumes, and are not in the least affected by the most severe weather conditions, except that the longer they are exposed the harder and tougher they become.

Residence of Mr. Patrick J. McCauley, Brooklyn, N.Y.
Covered with J-M Asbestos Shingles.
A. J. McManus, Architect

J-M Transite Asbestos Fire-Proof Shingles

Are moulded under hydraulic pressure into a homogeneous mass. They never rot, decay, warp, or split like wood shingles. Are tough and resilient, but not brittle, so do not break and fall off like wood or slate. Weighing only about half as much as slate, they save considerable in freight, are much more easily handled, and there is no danger of breakage. These shingles are also excellent non-conductors of heat and cold.

J-M Transite Asbestos Shingles are easily put on with ordinary woodworking tools. Come in many different sizes and shapes to meet all conditions, and in colors of natural gray and Indian red.

Residence of Mr. W. Hilt, Ridgewood, N. J.
Covered with J-M Asbestos Shingles.

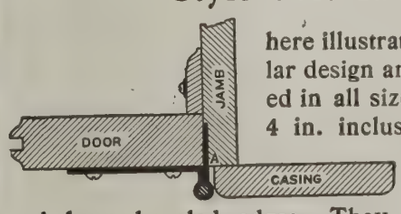
No. 450 —CUT FULL SIZE, 3½ INCH

WE INITIATE—NEVER IMITATE

A Big Hit

Is the new tip with which "NATIONAL" Butts are now equipped, both Common and Ornamental.



The TIP is threaded and screws into the Butt in both the Japanned and Plated finishes.

It is also SLOTTED for A SCREW DRIVER, making it easy to remove the tip and affords ready access to the pin.

The slot also indicates instantly which is the bottom of the butt—a feature greatly appreciated by the carpenter.

These are exclusive "NATIONAL" features.

Style No. 450

here illustrated is a very popular design and can be furnished in all sizes from 1½ in. to 4 in. inclusive. These butts are highly polished, double plated and have beveled edges. They match escutcheon plates with beveled edges. Ask for "Catalog B" and give dealer's name.

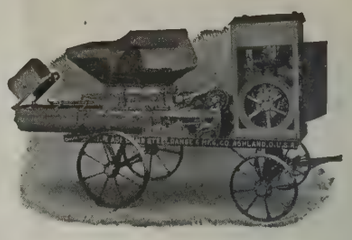
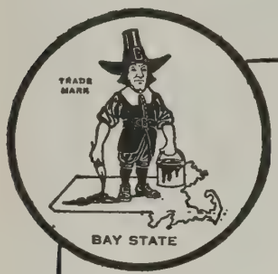
U. S. Standard Cement Mixers and Block Machines

ARE THE STRONGEST LONGEST AND EASIEST WORKERS ON THE JOB



"U. S. Standard Junior Block Machine.

OUR U.S. Standard Junior and Senior Block Machines are both built upon the same basic principles, the former building a 16", the latter a 24" long block and all fractional lengths thereof. Both of these machines build hollow blocks 6", 8", 10" and 12" thick and veneer blocks 3", 4", 5" and 6" thick. The equipment also provides plates for circular blocks, angle blocks of any desired angles, porch pier blocks, chimney blocks, etc. These machines are capable of producing a greater variety of styles and sizes of blocks without additional investment than any other machine made, and for simplicity, speed, completeness, strength and beauty of blocks cannot be equalled.



THE U. S. Standard are continuous mixers. The measuring and proportioning of the cement, sand, gravel or crushed stone is done automatically. With the U. S. Standard measuring is positive, and does not vary with coarse or fine, wet or dry ingredients.

SPECIAL FEATURES—Accuracy in measuring, correctness in proportioning and thoroughness in mixing the ingredients. All these operations are automatic and absolutely reliable. Detailed information will be furnished upon application for our Catalog No. B.

Senior No. A

THE ASHLAND STEEL RANGE & MFG. CO. ASHLAND, OHIO

The Original

BAY STATE Brick and Cement Coating

Protects concrete or stucco walls, floors and ceiling against damage from moisture and does not destroy the pleasing texture of concrete or stucco, It has been endorsed by the National Board of Fire Underwriters as a fire retarder, has been applied with great success to the exteriors and interiors of residences, hotels, factories and mills; when applied on ceilings it does not drop off, thus preventing damage to delicate machinery. It is not affected by acids or smoke.

FOR FLOORS

It prevents floors from dusting and sanding and is admirable for hospitals and similar institutions, will stand wear and washing. Write us for particulars about its application. We can give you the names of some of the best residences and best textile and other mills where it has been used successfully under most adverse conditions.

Talk As You May About Mixers

You Cannot Get Away From This Fact

That no high-charging mixer is complete without a charging hopper and elevator; that fully one-third of the power is required to operate the loading device; that one-third of the attention is required to operate it; that charging skips get out of order quickly, and that you save all of this needless expense in the low-charging, direct from barrows,

Eclipse Concrete Mixer

The Only Low Charging Batch Mixer

It is charged two feet from the ground and both platforms and approaches are **portable** with the mixer.

And don't forget we mean exactly what we say and can supply the proof that it saves one-third of the cost—one third of the first cost and one-third of the operative cost.

Better investigate the cost-saving of the Eclipse Mixer Catalog No. 32 by first mail if you say so.

MODEL "A" BLOCK MACHINE with Tamper and Scraper and Finisher Attachment

IDEAL CONTINUOUS PROPORTIONING MIXER—Mixes and Proportions Accurately

These Men are Making Big Money with Ideal Concrete Machinery

We have told you many times and in many ways about **Ideal** machines and the superior product that is produced by them. This month the **men on the job**—the men who are making their bread and butter with **Ideal** Concrete Machines—will tell you what they think of them.

W. R. Bradshaw, Wilmington, N. C.

"I have before me now at least 12 months work. Every job I complete I get another call. The **Ideal** Machine I bought last May deserves this credit."

W. B. Weare, (Dierks Lumber & Coal Co.,) Sterling, Neb.

"The **Ideal** block machine purchased of you last spring is a money-maker in every way. It is saving in material and quick in operation. Also turns out blocks that sell to advantage over those made on other machines. We are having good success marketing our blocks, and at a nice profit. It is my opinion that concrete blocks are one of the best side lines that can be handled in conjunction with a lumber yard."

Dale Concrete Co., Dale, Ind.

"In regard to the **Ideal** Machine, we like it fine. It makes nice blocks and we have sold about 1,000 blocks already. People like our blocks and claim they are better than other block makers put out."

John B. Wolfkill, Hagerstown, Md.

"Enclosed find remittance for $512 in settlement for **Ideal** machinery. I am fully convinced, after losing over $2,500 on another outfit, that **Ideal** machinery is the only machinery to make concrete blocks on a large scale at the least cost."

If these men can make big money with IDEAL Concrete Machinery so can you. They first learned about the IDEAL line through our literature. Follow their example. Mail the coupon today, checking on same machines that interest you

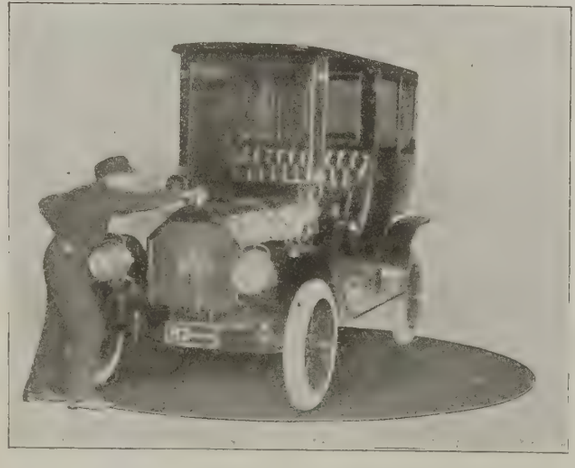
Notes on Heating and Ventilation

Price, $2.00 delivered



By *John R. Allen*, M. Am. Soc. Heating and Ventilating Eng.; Junior Professor Mechanical Engineering, University of Michigan, Ann Arbor.

Second Edition; Bound in Cloth, 6¼x4¾ in.; 200 pp.

This book is a resume of lectures delivered to classes in heating and ventilation at the University of Michigan. It is written primarily for the steamfitter and designer of heating systems It presupposes a knowledge of the construction and operation of the simpler forms of heating systems. Reduced to as brief a form as possible, so that readers can readily find notes or data desired.

Contents—Theory of heat and measurement of temperature. Heat losses from buildings; rules for determining heat losses in different constructions. Different forms of heating systems; their advantages, disadvantages and relative economy. The design of a direct steam heating system. The design of an indirect heating system. Steam boilers and steam piping. Carrying pipes underground, etc.

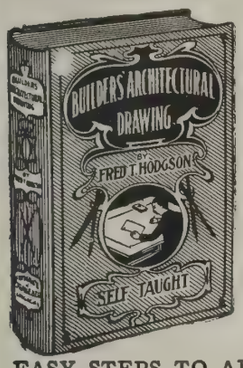
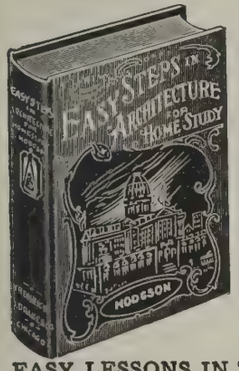
PRACTICAL BOOKS FOR THE BUILDING TRADES



THE STEEL SQUARE—TWO VOLUMES. A PRACTICAL TREATISE ON THE USES OF THE STEEL SQUARE. By Fred T. Hodgson. 600 Pages, 500 Illustrations.

Two Vols., Cloth Binding. Price.....$2.00
Single Vols., Part I, Cloth. Price..... 1.00
Single Vols., Part II, Cloth. Price..... 1.00

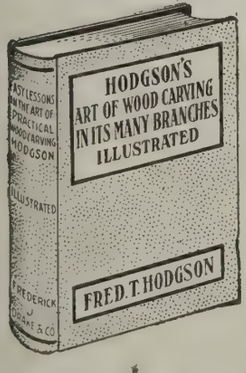
Mr. Hodgson was the first—as well as the last—person who has written on this important tool, and the two volumes now issued contain the earliest and the latest up-to-date methods of applying the STEEL SQUARE for the solution of the many problems this wonderful instrument can solve when in capable hands. The two volumes, named herewith, contain about all that is possible to be done with the square, that is of practical value to the workman, and, as they show nearly all the simple, as well as the difficult things, that can be accomplished with the aid of this tool, there will be little trouble for the workman to work out any minor problem that may confront him, if it is within the purview of the tool. In short, the two volumes contain all that can now, or hereafter, be accomplished with the square. They are profusely illustrated with diagrams, and explanatory sketches, which cover the whole ground of steel square practice. Two volumes of the greatest possible value to the young carpenter.



BUILDERS' ARCHITECTURAL DRAWING SELF-TAUGHT. By Fred T. Hodgson. F. A. I. C. 336 Pages, 250 Illustrations and 18 Folding Plates, 12mo, Cloth Decking. Price.....$2.00

This work is especially designed for carpenters and for students of architecture, woodworkers and others who desire to learn drawing at home, and who have not the means, time or opportunity of taking a regular course in school, or college, nor of availing themselves of the offers made by one or other of the "Correspondence Schools."

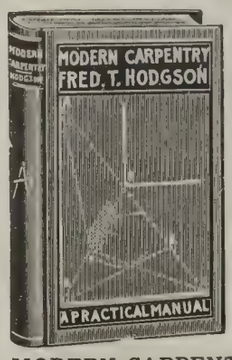
The work commences with a description of drawing instruments and accessories, with rules for using them, and hints as to their care and management. Rules for laying out simple drawings and executing same are given, and the student is taught step by step to draw to scale, first the plans, next the elevations, and finally the details of a cottage, including foundations, walls, doors, windows, stairs and all other items required for finishing a small building complete in every particular.



EASY STEPS TO ARCHITECTURE. PARTICULARLY DESIGNED FOR HOME STUDY. By Fred T. Hodgson, F. A. I. C. 350 Pages, 230 Illustrations, 12mo, Cloth Binding. Price .$1.50

As every mechanic employed in the building trades must necessarily have some knowledge of architecture, a book of this kind will be found by him to be a great assistance in acquiring such knowledge without a great expenditure of effort. A part of this work has been for years a sort of text-book in schools where architecture is taught, and is a catechism to some extent. The questions and answers are easily understood and as easily remembered.

The second part of the book deals more particularly with architectural styles, while the first part is mostly devoted to the classic orders, Greek and Roman. Full explanation of the latter styles are made, and illustrations show these styles and give a brief history of their growth and decay.



EASY LESSONS IN THE ART OF PRACTICAL WOOD CARVING. By Fred T. Hodgson, F. A. I. C. 284 Pages, 200 Illustrations, 12mo, Cloth Binding. Price.....$1.50

This work, "Easy Lessons in Practical Carving," is prepared in the same happy, easily understood style of writing that has made the name of the author so famous among the working men of English-speaking countries.

The lessons given in this new book begin at the very beginning of carving and lead the young workman by easy steps through the mazes of the art, until he is able to turn out work of a creditable character. The use and care of carvers' tools are given and explained, and the tools described and shown in illustrations, with methods of sharpening and honing the tools, in a clear and interesting manner. All necessary appliances are shown, described, and illustrated, both for holding the work, and for preparing the tools and finishing up the carvings. The various styles of carving are fully explained, such as flat carving, chip carving, incised carving, scratch carving, figure carving, carving in relief, round carving and jewelry carving.

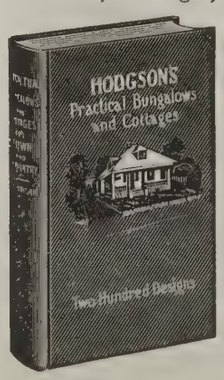
MODERN CARPENTRY AND JOINERY—VOL. I. By Fred T. Hodgson, F. A. I. C. 300 Pages, 318 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is a real modern work, and the large numbers of it that have been sold (over one million) is an evidence that American workmen have found in it the things they expected. It is one of the best books of the kind ever brought out for teaching the young workman the art of correct and easy wood-working. It shows how to lay out roofs, rafters, stairs, hoppers, bevels of all kinds, mitering, coping, circle work, flooring, splayed work, plain stairs and handrailing, cornicing, dove-tailing and many other things the young carpenter will require to know in the performance of his regular work. It is written in a very simple style, and can be understood by any person who can read everyday English. Unlike other works prepared for workmen, it is void of bewildering formulae and algebraic puzzles, and the reader is not asked to wade through long mathematical calculations to get at the kernel of the subject before him. The work contains some 300 illustrations and diagrams, all of which are explanatory and instructive.

MODERN CARPENTRY AND JOINERY—VOL. II. ADVANCED SERIES. By Fred T. Hodgson, F. A. I. C. 400 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This volume is somewhat similar to Vol. I, only on advanced lines, and is intended to follow up the progress made by a study of the first. Indeed, it is simply a continuation of the first volume, on a higher plane, and no workman having mastered the contents of one, will rest satisfied, until he has also mastered the contents of the second volume.

This volume contains some examples of work, with a description of the way the work is performed, and the materials employed. Many very difficult problems are here shown and the solutions and explanations are given and fully explained, many things that at first seem formidable to the unpracticed workman, become quite easy of solution under the magic wand of the author's method of explanation.



COMMON SENSE STAIR BUILDING AND HAND-RAILING. By Fred T. Hodgson, F. A. I. C. 300 Pages, 300 Illustrations, 12mo, Cloth Binding. Price.....$1.00

This is an excellent work for the young carpenter who is ambitious of becoming an expert in handrailing and stairbuilding, inasmuch as it commences at the very beginning of the art, and shows how to lay off a stair on the floor, placing the newels, laying off treads and risers, strings, winders, wells and flyers.

The object of the author is to lead the student step by step, in such a way that he takes in the whole art of stairbuilding before he is aware of it. This is decidedly the best and most practical work on stairbuilding in the market, and just what the untrained workman wants. The part of the book devoted to handrailing exhibits three different methods of laying out and working handrails suitable for any kind of stairs, straight, circular, elliptical, or for stairs with landings, doglegged, newels, or cylinders. These systems of handrailing have been taken from the best sources on the subject, and have been revised and edited in the most careful manner.

PRACTICAL BUNGALOWS AND COTTAGES FOR TOWN AND COUNTRY. Arranged and Edited by Fred T. Hodgson, assisted by E. N. Braucher, Architect. 12mo, Cloth, 420 Pages, 400 Illustrations. Price.....$1.00

This work contains perspective views and floor plans of over two hundred choice bungalows, cottages, houses and flat buildings, selected with great care to combine architectural beauty, convenience and economy of construction, ranging in prices from $500.00 to $3,800.00. Every plan shown is made by a licensed architect and has been built from, to the entire satisfaction of the builder and within the estimated cost. This work will be found invaluable to the home builder, furnishing many new and up-to-date ideas and suggestions in modern architecture. The number of California bungalows, which the editors have taken great pains to select, are without question the most attractive modern low cost homes ever built. We are prepared to furnish blue prints at a very moderate cost, ranging from $5.00 to $15.00, according to cost of erection, consisting of floor, roof and foundation plans, front, side and rear elevations, with complete type-written specifications.

Any of the above books sent Post or Expressage Prepaid on receipt of price.

The 20th Century Bricklayers and Mason's Assistant

By FRED T. HODGSON

This work is in two parts combined in one volume, the first part being devoted altogether to brick work of all kinds; and this includes an explanation of the various terms employed in the trade with illustrations and definitions showing what the terms really mean.

There is a chapter on Foundations which goes into the matter at great length, and is fully illustrated and explained, and which shows how to lay out and prepare any kind or shape of foundation.

Damp courses are dealt with in a separate chapter in which the various methods of constructing damp courses are fully illustrated, described and explained are shown. Various methods of forming brick pilasters, columns, quoins and pands are explained, illustrated and described. Joints in brick work are illustrated, described and explained in a separate chapter in which the kinds of mortar to employ for various works are defined. Chimney breasts, flues, stacks, fire-places and chimneys of all kinds are described and illustrated.

Brick bonding for all sorts of work is shown and illustrated by a large number of diagrams and the manner of bonding is fully explained. Brick arches of every kind, gauged and ungauged, are explained at length, and a large number of illustrations are shown, giving methods of describing the arches and obtaining the joints for same. Bay and oriel windows are discussed and the methods of working them are shown and described both by text and diagrams. Methods of measuring brickwork, pointing, concrete and other matters for the estimator are fully described. The tools used, by the bricklayer and his helpers are fully illustrated and described. Bricklayers' mortar and other useful memoranda close Part One of the book.

Part Two deals with the stone mason's work altogether and opens with a chapter on definitions of technical terms used in masonry. Tools and appliances are fully described and as fully illustrated, with explanations and methods of using them. The trade names of wrought stones are given with illustrations showing the work in progress and in a finished state; also methods of working them. Methods of building walls in rustic rubble, ashler square, uncovered, random coursed, irregular corners, snecked and squared rubble, picked polygonal ragwork and other styles of work are explained and illustrated. Finished stones such as window sills, window heads, copings, arch stones, key stones and other dressings are described and illustrated. Stone arches and joints are described and illustrated, with ample instructions for working them. A chapter on preparing stone steps and stairs is given, along with complete diagrams and instructions showing how the work is done. There is also a chapter explaining the method of building a circular headed window or door in a circular tower or other circular wall. A chapter on estimating stone work, with a copious specification is also included along with a short treatise on building skew arches and skew bridges, and which is illustrated with a large number of diagrams and working sketches, showing how to do the work in a proper manner. This part is illustrated with over 200 working drawings and diagrams.

The whole work contains over 450 fine illustrations and diagrams, and is complete cyclopedia of practical instructions in brick-work and masonry and must prove of inestimable value to the operative bricklayer and mason. 12 mo., cloth, price, $1.50; half leather $2.00.

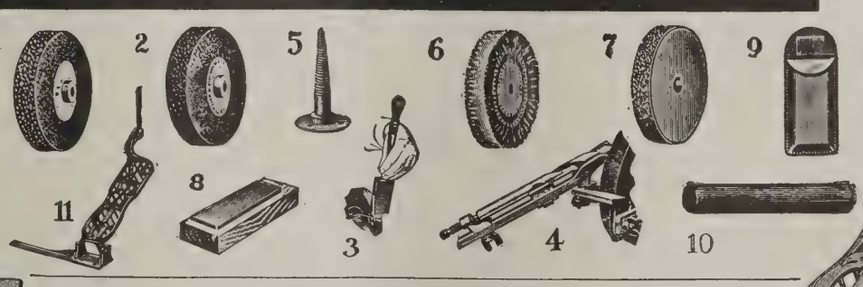
6 MONTHS FREE TRIAL

Special Offer on Shop and Factory Outfit

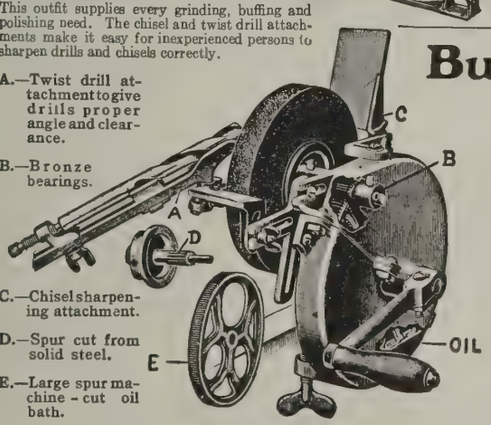
We want every carpenter, every shop, factory, contractor and tool-user to try this grinding, buffing and polishing outfit for six months free—a whole half year for you to find out how this perfected genuine Carborundum grinder saves tools, saves time, and earns money for any shop, factory or individual tool-user. We want you to prove these facts on your own tools. The whole half year's use will cost you nothing. Try it free for 6 months is what we ask and prove it is a big money-maker for you. Then send it back, if you wish—no hard feelings if you do. Send back the coupon at the bottom of this page for our 6 months' free trial offer.

Luther Diamond Tool Grinder

25 Times Faster Than The Grindstone—6 Times Faster Than Emery Wheels



The wheels of this grinder are genuine Carborundum. Nothing is so hard as Carborundum except the genuine diamond. Wheels actually made of genuine diamond would cut no faster. In reality Corborundum crystals are artificial diamonds, made by fusing the elements of real diamonds in the electric furnaces at Niagara Falls, in which fire brick melts and runs like butter. In this *utmost* heat, Carborundum crystals get a temper and sharpness that cuts hardest steel or toughest malleable iron as emery does copper. Carborundum wheels do not glaze—they peel steel away in tiny shavings at lightest touch—no hard pressure necessary, no frictional heat, no water cooling necessary, no danger of drawing temper. Genuine Corborundum wheels do not get soft in spots, wear lopsided or glaze. They will outlast any number of emery wheels, saving that much money. They make it so easy to keep tools keen and bright, that tools are kept that way, and that means more, faster and easier work. They will not draw temper and tools last longer, which means another saving—to say nothing about the time saved in sharpening. But don't take our word—prove these facts by a half year's free use of this splendid outfit.



11 TOOLS IN ONE

This special offer on our shop and factory grinding, buffing and polishing outfit is a remarkable value—the greatest reasonably priced grinder offer ever made. This outfit, on which we will make a 6 months' free trial offer, consists of one Mechanic's Special Luther Diamond Tool Grinder with the following accessories;

1. One Rough Genuine Carborundum Wheel
2. One Fine Genuine Carborundum Wheel
3. One Chisel Grinding Attachment
4. One Twist Drill Attachment
5. One Polishing Spindle
6. One Buffer
7. One Polisher
8. One Oil Stone
9. One Carborundum hone in leather case
10. One Carborundum scythe stone
11. One foot power attachment

This outfit supplies every grinding, buffing and polishing need. The chisel and twist drill attachments make it easy for inexperienced persons to sharpen drills and chisels correctly.

A.—Twist drill attachment to give drills proper angle and clearance.

B.—Bronze bearings.

C.—Chisel sharpening attachment.

D.—Spur cut from solid steel.

E.—Large spur machine-cut oil bath.

Built Like a High Grade Lathe

The Luther Mechanic's Special, forming the basis of this Special shop and factory outfit, is built for a lifetime of service—has steel and malleable construction, dust-proof, bronze bearings, machine cut spur gears, bearings run in oil bath—speed 2,500 revolutions per minute. Carborundum wheels guaranteed 5 years.

Return this Coupon for 6 Months FREE Trial Offer on Special Shop and Factory Outfit

By returning this coupon you will not put yourself under any obligation whatever. We will send you full details of our Six Months' Free Trial Offer, and full description of this splendid grinding, buffing and polishing outfit, also the reprint from McClure's Magazine telling the interesting story of the discovery of Carborundum. Everything we send is free, and puts you under no obligations. If you want to increase shop production, save time, or make your work easier, let us tell you about this grinder.

Send back the coupon today.

THE NATIONAL BUILDER

Vol. 52 CHICAGO, MAY, 1911 No. 5

THE MAYFLOWER FRAME HOUSE, built at Omaha, Nebraska

NATIONAL BUILDER DESIGN No. 341

I. P. Hicks, Architect, Omaha

For Floor Plans, Elevations and Details, See Supplement of this Number. Estimated Cost $1,988.75

THE MAYFLOWER FRAME HOUSE

Our supplement sheet for May shows a $2,000 house of five rooms, reception hall and bath. This house was recently built at Omaha, Nebraska, from the plans of I. P. Hicks, architect. The actual cost as detailed in the adjoining estimate was slightly under the $2,000 mark. In some sections of the country this cost would be changed by local conditions, material and labor, but it should be possible to calculate the changes from the detailed estimate.

A great many inquiries are made regarding cubic foot cost. In this case we have a building 24 ft. wide, 28 ft. long and about 28 ft. from the basement floor to a point two-thirds up on the roof, making 18,816 cu. ft. At the price quoted, the cubic foot cost would be 10.6 cents; about right for this class of building.

Particular attention is called to the grouping of the rooms on the first floor. The parlor and kitchen are entered from the hall, and the dining room from both the parlor and kitchen. On the second floor the sloping roof allows two good bedrooms with ample closet space, which, in a house of this character, is preferable to a third-story attic. The house could be built on a narrow lot, as all the rooms have either a front or rear exposure.

TARSUS LIGHTED BY ELECTRICITY

THE ancient city of Tarsus, Asia Minor, has recently been introduced to the modern electric light. The power is taken from the Cydnus river, which has a very rapid flow. About a mile and a half from the city, an eighty horse-power turbine is used to drive a large dynamo, which furnishes sufficient power for sustaining one thousand lamps of sixteen candle-power each. Four hundred and fifty of these are used to illuminate the streets of the city, and the remainder will be furnished to private consumers.

Prayers for the killed by fire and by falling, and the destruction of death-traps are all very well; but the prevention of fires in overcrowded buildings, and efficient provision for the escape of the people cooped up in such buildings would have a better effect on the living.

* * *

The 145 young lives snuffed out by the late fire disaster in New York, following as it did, on the heels of the City of Newark holocaust, almost makes one's blood run cold, and to ask ourselves the question, "Whose turn will it be next?" It seems strange—very strange—that in a country like this, a country that boasts of its great progress in all the arts, sciences, inventions, and improvements, that such life-destroying disasters should be possible. "There is something rotten in Denmark!"

* * *

We are constrained to ask why it is that hundreds—maybe thousands—of working people are crowded into the top stories of cloud-touching structures, when, in this land of magnificent distances, there is plenty of room directly on the face of mother earth, to accommodate all the workers in the universe?

* * *

If we must "hive" the boys and girls in city buildings, why not keep them down on the ground floors, or certainly not higher than the third floor up. Large windows to raise or open as doors, could be provided in the front and rear, or in the sides, if the building permits of such an arrangement would admit of exit under fairly safe conditions. It would be better to construct modern city buildings intended to be used as workshops, so that they could truthfully be called "Life-safe" buildings, instead of fire-proof. The designation would be much more Christian-like, for "fire-proof" spells for the protection of property—dollars and cents—while "life-safe" buildings, covers something much more precious than Mammon's gifts.

* * *

THE NATIONAL BUILDER is of the opinion that so long as workers are hived in upper stories or "lofts," there will be no exemption form these dreadful disasters, and in order to lessen their virulence and frequency, each city or state should enact drastic laws, compelling employers to furnish "safe buildings" for their people to work in, and the authorities should see to it, that all laws regarding the matter of safety are strictly and determinedly enforced. The peoples' lives should not be endangered for either gain or loss in money. In many of our large cities there is much need of profiting by these terrible lessons, for it is reasonable to imagine that many workers are employed under conditions which envolve continuous exposure to danger. Few realize that to say a building is fireproof means nothing more than that the structure itself can pass through a fairly serious fire with only a moderate amount of damage. Such a building really offers little additional security for the goods it contains or the people who occupy it if no other precautions against fire are taken. Safety for the occupants must be sought through other means. This may seem so elementary a fact as to be hardly worth stating, yet the public often fail to comprehend it. No precaution in construction can obviate the necessity for fire escapes. The laws are fairly comprehensive. but the lesson of New York's experience is the need of careful and continuous enforcement.

* * *

The New York *World* says: "1. That there are hundreds of factories, office buildings, storage-warehouses, and lofts without any means of escape from fire provided.

"2. That most of the big hotels are either without any fire escapes, or with totally inadequate provision for escape.

"3. That big, new apartment houses on the upper west side, the last word in buildings of that character, are totally without fire escapes.

"4. That scores of schools, asylums, hospitals, and similar institutions are without proper protection for the inmates in cases of fire."

Of 1,463 cloak and suit factories recently investigated by a committee of the Joint Board of Sanitary Control of the Cloak and Suit Industry, which represents the manufacturers, the unions, and the public, we learn that 1,173, or 97.5 per cent, had hall doors opening inward, instead of outward as the law requires; 491 had no fire-exits except one fire escape; 60 had halls less than three feet wide; 28 had doors leading to halls and stairways locked during the day, and 14 had no fire escapes.

This is a frightful state of affairs, and is simply a forecast of another, and perhaps a worse disaster than that of Washington Place.

* * *

The architects of Chicago seem determined to declare war on the plumbers and steamfitters' unions, if these latter do not agree to submit their difficulties to arbitration. The architects say: "If the men in the trades do not alter their course and settle their difficulties at once, the architects will get the work done outside the unions. They must not expect us to lose thousands of dollars through their quarreling." It is expected trouble will grow out of this matter if the difficulties are not settled and the architects get their work done outside the unions, as violence is threatened. It is to be hoped the matter may be settled before extreme measures are taken. Doubtless there is room for complaint on both sides.

* * *

The basis of all the applications of reinforced concrete is that the two materials entering into its combination—namely, steel and concrete—shall be used to assist and strengthen each other in those properties and directions in which one or the other is deficient. And the most important of these is that concrete, which is a cheap material, shall be used to display its characteristic property of compressive strength, and steel to take the tension in which the concrete is weak. Concrete will bear a larger crushing load, but it is brittle, and will break across if loaded as a beam. However, steel is not only used to resist tension—it is often used to strengthen the concrete in compression. The two materials possess as a combination properties which are seemingly different from those of either alone. It is this result which led some persons to acclaim that reinforced concrete was a novel material, and deserving of a new name. The name "ferro-concrete" is not entirely happy, because it suggests its literal interpretation of iron-concrete, which would imply a concrete in which the aggregate was bound together by a rust-cement, such as that made with iron filings and sulphur, or that the ingredients are united by iron rust simply. The French early called it "*Béton Armé*" or "*Cement Armé.*" The latter is inappropriate for concrete, because it only refers to cement; the former title is better, and its nearest English rendering is "Reinforced Concrete," though another translation sometimes used is "Armoured Concrete," which is quite inadequate, for the concrete is not protected by a sheathing or armour as the name suggests. Then we have the American term, "Concrete-steel." This is, however, a hybrid that does not signify in any degree the nature of the combination—it might means anything to do with concrete or steel. Reinforced concrete is, of course, not quite happy, for it gives undue importance perhaps to the concrete, though that is the most striking feature of the dual material, but still it seems the best we have, so it meets with most favor.

The Third National Conference on City Planning is being held this year at Philadelphia, on the 15th, 16th and 17th of this month. Since the very successful conference at Rochester in May of 1910, the value of such a meeting is becoming more generally recognized not only among architects and engineers, but among city officials of broad view, and business organizations of progressive spirit. The conference is not a sporadic producer of academic papers. It is the forum where those who are handling large city problems exchange views. It achieves for the development of the city what an industrial congress achieves for the development of industry. Since the emphasis is laid on free discussion of city planning ideas, ample opportunity will be given throughout the sessions and at informal round table conferences to bring out these ideas. Prepared papers will serve merely to guide the discussion into specific channels and avoid waste of time in random talk.

YOUR MECHANIC'S LIEN RIGHTS

By AN ONLOOKER

A mechanic's lien is a claim which one person has upon another's property for which materials or labor, or both, have been furnished toward its construction or improvement.

We think there is no good reason that can be given which should allow you to permit your lien rights to expire.

Even though the owner is a perfectly honest man, and declines to pay what is due, it is a sufficient reason for you to protect your rights by placing in due season a lien on the property. After the right to file has passed, you will find it harder to settle and collect what is owing you, should there be a question as to charges made for extra work done.

Where you are fully satisfied of the owner's ability to pay there can be no objection to your taking his note in payment. You would probably find it possible to discount it at the bank and thus have use of the money.

If the building or property is in the name of the wife, be sure and have her sign the note as one of the makers. Should it then be necessary to bring suit on the note for non-payment, you can hold her too, and the property, if not sold in the meantime, is subject to execution.

Get a judgment note if you possibly can. If in taking the note you are waiving your lien rights, you will probably find the owner will not object to signing a judgment note. It simply means that there is power of attorney given, authorizing entry of judgment by confession in default of payment. Thus the means of collection is easier, for judgment can be more quickly had and execution filed without the necessity of first bringing suit on the note.

It would do no harm to become perfectly familiar with the laws of your state covering lien rights. There are probably many things you would not do if you knew the laws, whereas, not being familiar, you tie up money in doing some work and probably never get it back.

A contractor's business is to do the work and get paid for it. It's his duty at the time of taking the work to know where the money comes from to pay for the work to be done. The most successful contractors do not hesitate in turning down work where the money is not already up for payment of the bills. They, therefore, have little occasion to worry about the necessity of filing liens.

Just stop one minute and consider how careful a banker is to get security before loaning money. There is no reason why a contractor should not use as much care in being secured for payment on work done.

To what extent does the Mechanic's Lien Laws of your state protect you? It is part of your business as a contractor to see that you are properly protected as to payment for work you do.

Better look into this, and if your state laws give you no right to place a lien, better take it up with your State representative.

Now is the time to look for spring work. Get what you can at a fair price, but don't be anxious for jobs on which you give all the profits and then some.

A good buyer, not alone considers the price, but quality as well. Then too, the question of delivery enters in, unless you get the goods, no matter what the price may be, it is not a good purchase. Quality is really the first point to consider, then the question of delivery, and lastly the price.

We know of contractors who will take on but one house job at a time, claiming they make more money during the year, than when they have many jobs to do. The reason given is that they are always on hand to personally direct the work, thus hastening its construction and avoiding errors by being there to direct the work. No one knows better than he does what is to be done, and his instructions can be safely followed.

We have quite often heard it said that a carpenter-contractor is a consumer and as such should buy his goods at home. There is plenty of room for a discussion on this subject. What say you?

It has been noticed that the farmer as a whole prefers to buy his own materials for the buildings he puts up, getting carpenters by the day to do the work. He expects, of course, to help out on the job, for at the time he builds he has little to do.

Its a good way of saving money at the expense of the contractor.

And by the way, this same farmer will let his machinery remain out in the open, unprotected from snow, rain, and sun, continually depreciating in value.

A penny wise and a pound foolish—tell him so, you contractors.

Its a good way of spending money at the expense of the contractors, as he ought to build sheds to protect them.

MATERIALS PRACTICALLY FREE

By H.

You have read advertisements wherein you were offered something for nothing, and you got something, thought not what you expected.

You will wonder at one saying that you can build with materials that cost you practically nothing.

It's been done in the past, and is being done every year, and will continue to be done, but only by careful and saving contractors.

There is a man named Jones, who has built a dozen small cottages, and still owns them, from materials saved from new buildings erected by him, and from old buildings torn down to make place for new ones. Nothing goes to waste. His men are trained to save in every way possible. In fact, they profit by it, for their economy gives them winter work, since Jones keeps them busy during the winter building cottages from materials saved.

Of course, he can't build each cottage complete without getting some new materials, but it is a fact, nevertheless, that the actual cost of the materials for the entire building is mighty little, and most of the materials used cost absolutely nothing, for if his men did not know they must be careful, the greater part of what he now used would be waste, carried to the wood-pit and burned up.

Its been these small savings that have made Jones rich and placed him in a position where he takes on old repair jobs most contractors shun. He finds less competition on a built-over house, and makes it plain in taking the job that all materials taken out of the job belong to him.

In order to care for the materials thus saved, he has built up a good sized barn, where he assorts the materials, getting them in shape to be used later.

It will be seen that he loses no time, for every moment he has to spare while at home goes to prepare these for a new house he will soon build for himself.

There are ways and ways to become independent and rich, and here is a way open to most any contractor, who, with care, both by his men and himself, can easily put in all of his time to good advantage, and soon see a reward for his painstaking.

THE CARPENTER'S OPENING

By GEORGE E. WALSH

THERE is no nobler or more important calling today than that of the carpenter, and he who has learned his trade thoroughly can generally depend upon a good living. There will always be lean years and fat years, seasons when business is dull or when strikes interfere with regular work, but taken on the whole over a series of years his average income is pretty satisfactory.

But should a carpenter be satisfied with this? Should he content himself with his daily wage and never aspire to anything higher? Restlessness is said to be the universal characteristic of our nation, and we find in every walk of life men aspiring to something higher. This instead of being condemned as a sign of restlessness should be taken as a sign of honest progress. Every employee wants to become an employer, and the ambition is a worthy one.

Now the young carpenter who has learned his trade thoroughly naturally aspires to become a boss carpenter some day, a builder, a contractor, and a large employer of men. In this field he must meet intense competition, and he must take the consequences of any false step. If he gives up his position working for others he must manage to secure profits sufficient on his contracts to make up for this.

Not all carpenters are fitted by nature to work for themselves except on odd small jobs. Of five ambitious men of this line who started in business for themselves, bidding on contracts, four failed, and are now back at their old job on wages. The fifth man succeeded better than he expected, and is today a big building contractor employing nearly two hundred men. His income some years, he told me, reached $20,000, and other years he lost rather

than made. But he is still forging ahead, profiting by his mistakes. The difference between this man and the other four who failed is not one of skill in carpentry, but one of mental make-up. He knew how to figure on a job, and knew how to handle men.

Another instance of a carpenter who succeeded as a building contractor with no such gifts as the other. What he knew he learned by experience and hard drudgery. He realized this early in life, and was therefore cautious in his work. He mastered his trade and then took small outside jobs that he could do after work hours. He took these not by the day wages, but for a lump sum. He wanted practice in figuring and estimating.

His first outside job was for a big dog house. He figured out the size of this, the cost and amount of material, and the time it would take a man at full day wages to complete it. Then he made his bid. He received the contract and came out even. He received nothing for his time and labor. Then he went over his figures and estimates carefully. His error was apparent to him then. He had made a mistake in one particular item, and that cut out his profit.

His next bid was for a shed attached to the back of a house. He made the same careful estimates, and got the contract. This yielded him a good profit. So from one small thing to another he advanced until finally he made a bid for a house. He was way under the other bidders, and he was afraid he had made some mistake. He had purposely pared down the cost of items to make his bid reasonable. He employed two men to help him. He learned from this experience two things. One was that other carpenters will not rush through work on a wage basis as fast as the man building it. He made just $300 profit on this house, but when he calculated up his time spent on it he found he was not getting much more than half the wages of mechanics. The other point emphasized by this work was that he had based his figures on such a close margin that if there had been any slight delay or interruption in the work he would have lost. He had provided no margin for unforseen accidents and emergencies.

Now it takes a long time to figure and estimaet correctly on a big job. Experience is a great teacher, but sometimes she can be helped out by study and second-hand information; but not always. This man grown confident by his last experience made a bid for a house costing upward of ten thousand dollars. As in the first instance he got the contract because his figures were the lowest of all bidders. This time he thought he would make money and get a good start. But a number of things interfered. The price of lumber took a sudden upward jump before he could get his orders in; there was a strike in town, and he had difficulty in getting competent workmen; an accident occurred when the framework was erected, and a heavy wind storm following close on its heels swept the whole thing down. When finished the man was a thousand dollars in debt, and put out of business. There was no way to pay back the thousand dollars except to work once more at day wages and save up the money.

But there was one thing he was proud of. The house he had built and lost on was a fine piece of work. It was well designed, well put together, and every square foot of lumber in it was first-class. It was a job that a man could point to with pride. Even in the face of failure the man had not skimped it any. Everything had been finished off completely. It was a monument to his undeserved failure.

He went back to his old job, and worked a year at it, saving up as much as he could, and paying a little at a time on the debt. Then one day, after doing an odd job for a wealthy man, he fell into conversation with him about buildings. The man was considering the construction of a fine house for himself. He was anxious to get all the disinterested advice he could. A carpenter working on odd jobs would not attempt to deceive him. By degrees he learned the man's story, and then went over and had a look at the house he had built. He consulted the owner and found that it was indeed a first-class piece of work.

The sequel of the story may sound like fiction, but it was one of those true stories which we occasionally find in real life which helps to prove that facts are often stranger than fiction. The wealthy man on strength of the recommendation that house gave hired the carpenter to build his $25,000 house. They figured on it closely together. The cost of everything was put down in black and white. The agreement was for the carpenter, who had been a contractor, to build the mansion, and receive as his pay ten per cent of the cost. It was a success. The man had a house that he was proud of, and the erstwhile failure was put securely on his feet. He paid off the balance of his debt, and had enough ahead to begin business with.

He had two houses that he could point to with pride as examples of his kind of work. Then he began bidding for work on the cost-plus-a-percentage basis. This was a new idea in that town. Many objected to it because it was new, and others took to it at once. In the end it was a very popular method of building houses. Having learned by previous mistakes and errors, the builder steered clear of pitfalls that await the hasty and careless estimator, and his bids were all of sufficient size to permit of good work and provide against delays and unforeseen accidents. His success was assured almost from the start, but it was well deserved and the result of previous failures.

Many a good carpenter today is kept from advancing because of a fear that he might lose rather than make if a big contract is taken. There are plenty of instances of where too much conservatism keeps good men from becoming good contractors and builders, and by the same token there are too many who have not sufficient conservatism to hold them back from risky speculation. The so-called speculative builder is often less a builder than a speculator. His art consists chiefly in assembling houses at the least possible cost so that they will pass superficial inspection. He is not a carpenter, not even a builder in the strict sense of the word, but simply an "assembler." He employs men of different trades to do the work for him. Sometimes he draws up his own plans, but more often he adapts them from the plans of others. Builders of this class hurt the trade; hurt the honest carpenter who tries to do his work thoroughly, and in the end casts general suspicion upon the whole contracting business.

The best builder is the man who has learned his trade thoroughly at the carpenter's bench, progressing gradually and steadily up to the positions of foreman, assistant contractor and builder, and finally to that of being his own boss and responsible man of affairs. Each step teaches him some lesson that will come in some day to help him out of difficulties. The man without such experience is apt to be a poor builder unless he can associate with him a capable carpenter who has come up through the different grades. His workmanship is bound to show in the quality of the buildings he erects, and these after all are the chief recommendations and certificate of character that tell in the long run.

BIRD'S-EYE MAPLE

THIS beautiful wood is found both in Europe and America, but it is with the American that the present article deals, as being best known in England. Mottled maple is also a native of the latter Continent, and is principally used for picture frames. The grain of the bird's-eye maple varies as the saw divides the eyes transversely or longitudinally, and pieces cut out in circular sweeps, such as chair backs, sometimes exhibit both the bird's-eye and the mottle at different parts. The occurrence of eyes, zones, spots and small curls in the wood gives rise to figures of great beauty. Of the wood so marked, bird's-eye maple, amboyna wood, the roots or butt of the common yew, and the common maple, are, perhaps, the most beautiful. The knobby tubercles that form in the root and trunk of the common elm from the repeated stripping off of the side branches, as is the general practice, afford, occasionally, very fine specimens, which are known by the name of "curled elm."

The maple was highly prized by the Romans, especially that which grew in Istria and Bœotia, and was distinguished by its curled peacock-tail veins. Pliny says it exceeded even the citrus in value, but could be obtained only in small pieces, for writing desks and similar articles. The bird's-eye maple shows, in finished work, the peculiar appearance of small dots or ridges, or of little conical projections, with a small hollow in the center, but without any resemblance to knots, the apparent cause of ornament in woods of similar character, as the burrs of the yew, and kiaboca and the Russian maple (or birch tree), and this led Mr. Holtzapffel to seek a different cause for its formation. He states that, on examination, he found the stem of the bird'seye maple of America, when stripped of its bark, presented little pits or hollows, as if made with a conical punch, others ill-defined and flattened, like the impression of a hob-nail. Suspecting these indentations to arise from internal spines or points in the bark, a piece of the latter was stripped from another block, when the surmise was verified from its appearance. The layers of wood being molded upon these spines, each of their fibers is abruptly curved at the respective places, and when cut through, they give, in the tangential slice, the appearance of projections, the same as some rose-engine patterns, and the more recent medallic engravings, in which the closer approximation of the lines at their curvatures causes these parts to be more black.

SPECIFICATIONS FOR REINFORCEMENT BARS

The American Association of American Steel Manufacturers, a technical body composed of 31 of the principal steel manufacturers, has adopted a standard specification governing the chemical and physical properties of concrete reinforcement bars. A feature of the adoption of this specification is the fact that it represents pioneer work on the part of the association, similar to the standard specifications for structural material and cement.

The present use of reinforced concrete requires an enormous tonnage of steel and the importance of having a standard and reliable quality is apparent. This specification already governs the manufacture of very large quantities of various kinds of concrete bars, and has been adopted by several municipalities and engineering firms, as well as the Isthmian Canal Commission and the U. S. Reclamation Service.

The society, through its secretary, Mr. Jesse J. Shuman, care Jones & Laughlin Steel Company, Pittsburg, Pa., will send additional copies on request.

In order that our readers may be familiar with this specification, we reprint it in full as follows:

STANDARD SPECIFICATIONS FOR CONCRETE REINFORCEMENT BARS—MANUFACTURE.

1. Steel may be made by either the open-hearth or Bessemer process. Bars shall be rolled from billets.

CHEMICAL AND PHYSICAL PROPERTIES.

2. The chemical and physical properties shall conform to the following limits:

PROPERTIES CONSIDERED	STRUCTURAL STEEL GRADE		HARD GRADE		COLD-TWISTED BARS
	PLAIN BARS	DEFORMED BARS	PLAIN BARS	DEFORMED BARS	
Phosphorus, maximum, Bessemer open-hearth	.10 .06	.10 .06	.10 .06	.10 .06	.10 .06
Ultimate tensile strength, pounds per sq. in.	55/70,000	55/70,000	80,000 min.	80,000 min.	Recorded only
Yield point, minimum, pounds per sq. in.	33,000	33,000	50,000	50,000	55,000
Elongation, per cent in 8", minimum	1,400,000 / T. S.	1,250,000 / T. S.	1,200,000 / T. S.	1,000,000 / T. S.	5%
Cold bend without fracture: Bars under ¾" in diameter or thickness	180° d.=1t.	180° d.=1t.	180° d.=3t.	180° d.=4t.	180° d.=2t.
Bars ¾" in diameter or thickness and over	180° d.=1t.	180° d.=2t.	90° d.=3t.	90° d.=4t.	180° d.=3t.
The hard grade will be used only when specified.					

CHEMICAL DETERMINATIONS.

3. In order to determine if the material conforms to the chemical limitations prescribed in paragraph 2 herein, analysis shall be made by the manufacturer from a test ingot taken at the time of the pouring of each melt or blow of steel, and a correct copy of such analysis shall be furnished to the engineer or his inspector.

YIELD POINT.

4. For the purposes of these specifications, the yield point shall be determined by careful observation of the drop of the beam of the testing machine, or by other equally accurate method.

FORM OF SPECIMENS.

5. (a) Tensile and bending test specimens may be cut from the bars as rolled, but tensile and bending test specimens of deformed bars may be planed or turned for a length of at least 9 inches if deemed necessary by the manufacturer in order to obtain uniform cross-section.

(b) Tensile and bending test specimens of cold-twisted bars shall be cut from the bars after twisting, and shall be tested in full size without further treatment, unless otherwise specified as in (c), in which case the conditions therein stipulated shall govern.

(c) If it is desired that the testing and acceptance for cold-twisted bars be made upon the hot rolled bars before being twisted, the hot rolled bars shall meet the requirements of the structural steel grade for plain bars shown in this specification.

NUMBER OF TESTS.

6. At least one tensile and one bending test shall be made from each melt of open-hearth steel rolled, and from each blow or lot of ten tons of Bessemer steel rolled. In case bars differing ⅜ inch and more in diameter or thickness are rolled from one melt or blow, a test shall be made from the thickest and thinnest material rolled. Should either of these test specimens develop flaws, or should the tensile test specimen break outside of the middle third of its gauged length, it may be discarded and another test specimen substituted therefor. In case a tensile test specimen does not meet the specifications, an additional test may be made.

(d) The bending test may be made by pressure or by light blows.

MODIFICATIONS IN ELONGATION FOR THIN AND THICK MATERIAL.

7. For bars less than 7-16 inch and more than ¾ inch nominal diameter or thickness, the following modifications shall be made in the requirements for elongation:

(e) For each increase of ⅛ inch in diameter or thickness above ¾ inch, a deduction of one shall be made from the specified percentage of elongation.

(f) For each decrease of 1-16 inch in diameter or thickness below 7-16 inch, a deduction of one shall be made from the specified percentage of elongation.

(g) The above modifications in elongation shall not apply to cold-twisted bars.

NUMBER OF TWISTS.

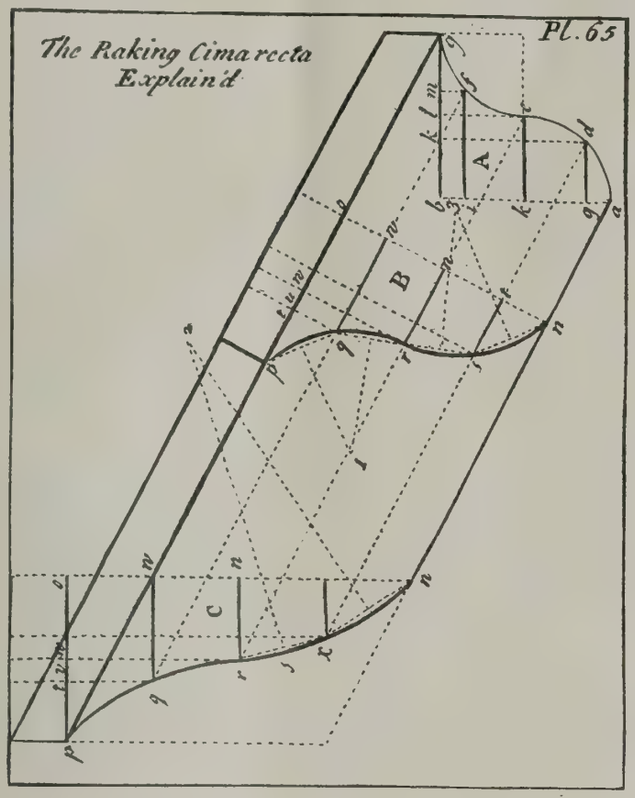
8. Cold-twisted bars shall be twisted cold with one complete twist in a length equal to not more than 12 times the thickness of the bar.

FINISH.

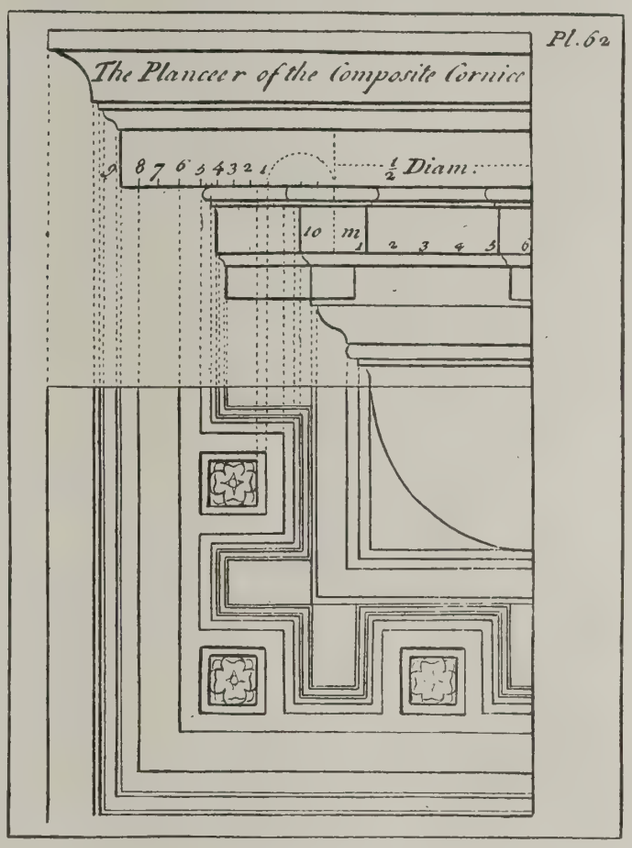
9. Material must be free from injurious seams, flaws or cracks, and have a workman-like finish.

VARIATION IN WEIGHT.

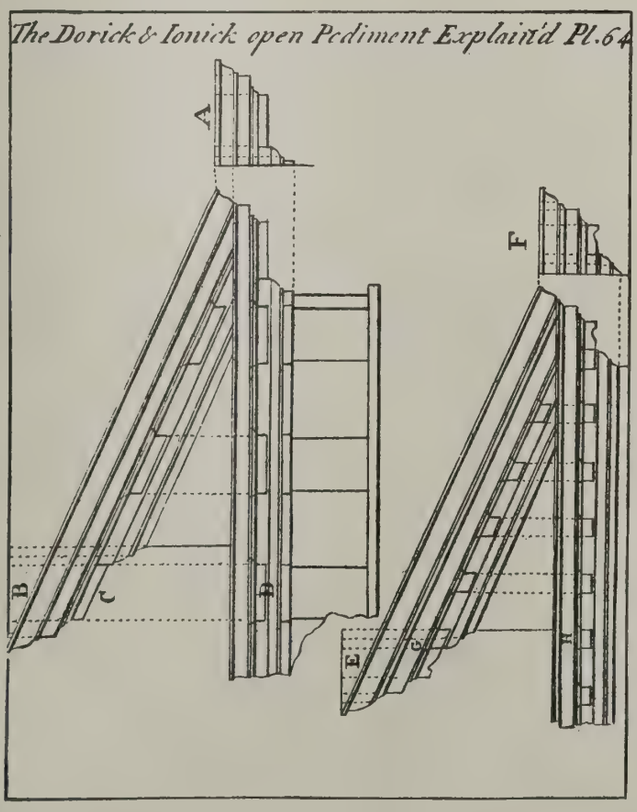
10. Bars for reinforcement are subject to rejection if the actual weight of any lot varies more than 5% over or under the theoretical weight of that lot.



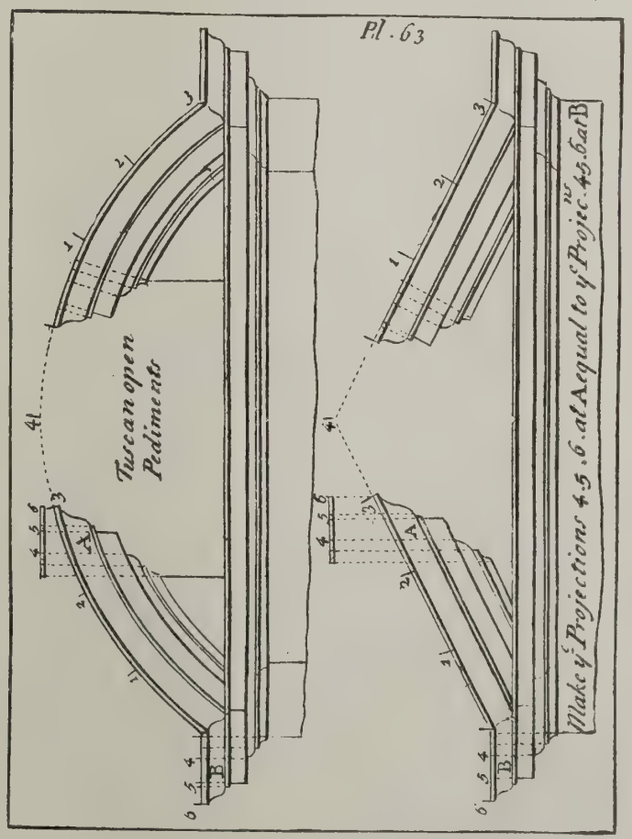
THE MODERN WHETSTONE



THE modern whetstone is as much an improvement on the old type as the modern automatic grinder is on the old grind stone. There may be, and probably is, many an old workman who has infinite faith in and swears by his old oil stone that has been with him forever, and the grit and whetting qualities which he knows thoroughly, yet with due respect to the good qualities of the old time oil stone, there is no man who will view the matter with a mind open to conviction but what will have to admit that the new offerings in the way of artificial abrasive material in various forms for whetstones is a long way ahead of anything we have ever had before.

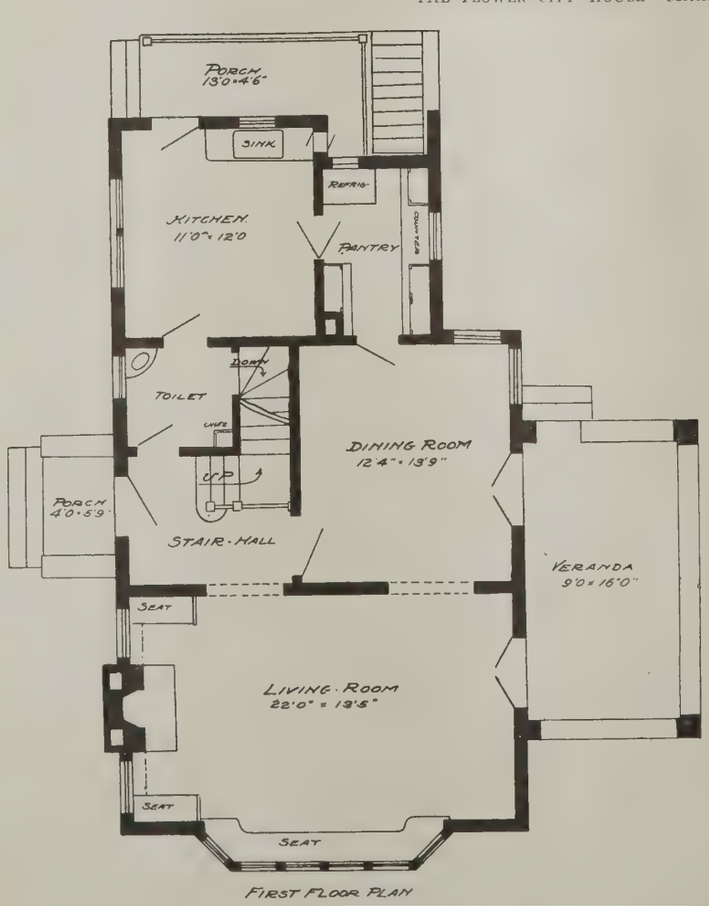


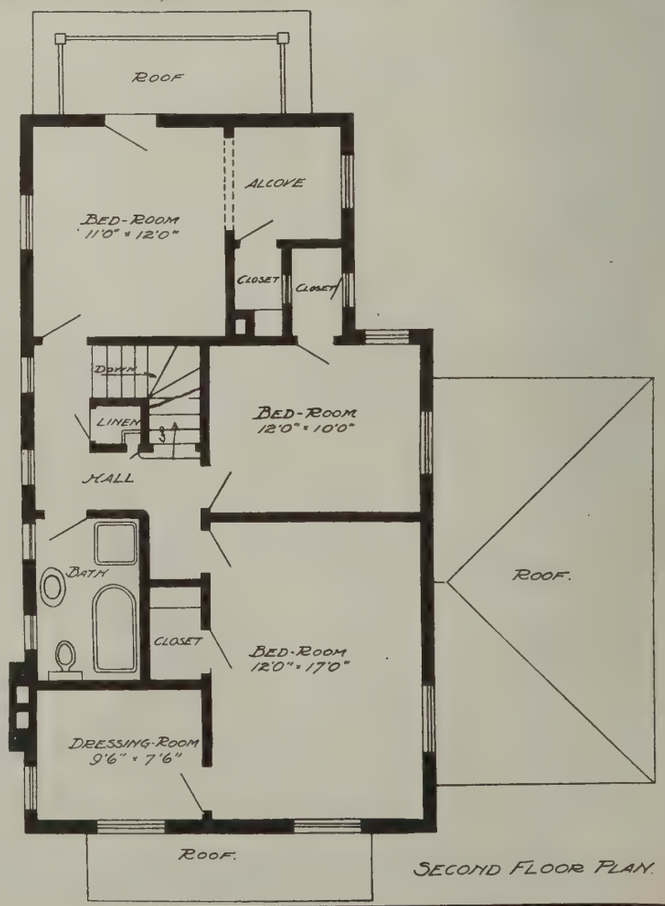
For one thing they are put up more conveniently and in any variety of shapes and sizes wanted, but that is only an incident. They are put up in varieties of fineness and the variations can be made absolute, because the abrasive material is pulverized and then separated into various forms by sieving so that all of that in a given grade is absolutely uniform. And you can buy exactly the number of grit you want and get it duplicated as often as you want it. You can buy a half dozen of different grades of grit as to fineness, or you can buy one stone with one side fine for finishing off and the other side coarse for rapid cutting, and with a stone of this kind you can often save going to the grind stone, do more whetting, and get it finished off in better shape in a little while than was ever possible with the old type of oil stone.



In short, the modern whetstone is designed and put up on a scientific basis, and if selected and used in the same manner is a great aid to smooth and rapid work and should be of such satisfaction to the workman that he will always keep a good equipment with him.

ARCHITECTURAL DETAILS--Reproduced from Batty Langley





THE FLOWER CITY HOUSE—CHARLES WILLIAM ELDREDGE, ARCHITECT.

FIRST FLOOR PLAN

SECOND FLOOR PLAN.

THE FLOWER CITY HOUSE

By WM. J. DUNN

This house is built at Rochester, N. Y., and is the home of R. A. Joroleman. It is of pleasing design and has many new features in construction.

The exterior walls are of Portland cement pebble dash. The roofing is all of red asbestos shingles.

The roof over bay window, the hood over main entrance with their massive brackets, the dormers with their unique lines and small paned casement windows and the uniform color of the plaster work are among the features of the exterior.

The woodwork in the living room, dining room and hall, including stairs, is red gum finished in a beautiful shade of brown while the floors are of white oak.

In the living room the mantel is of new autumn tile, the hearth of red Welsh tile. On each side are bookcases with double doors having leaded diamond shaped glass while above each book case is a small window with stained glass and by each bookcase is a comfortable seat.

The bay window with its half dozen stained glass windows gives ample light. This window has a large comfortable seat with radiators concealed beneath. The ceiling is heavily beamed.

French windows open from both dining room and living room to a spacious porch which has a red Welsh tile floor, making it cool and inviting on warm days.

Between the stair hall and kitchen is a toilet, and from here is an entrance to basement. This toilet, kitchen and pantry are all finished in white tile. The pantry is large and has commodious cupboards, etc. The kitchen is also of good size and opens on a large porch at the rear. Here is an outside entrance to the basement. The entrance porch has red tile floor.

On the second floor are three large bedrooms. The front room has a large dressing room and closet. The woodwork in this room is of red gum, finished a rich red mahogany. The rear bedroom has a large alcove and closet and the side bedroom has a large closet.

Off the hall is a linen closet, also a clothes chute to basement. Brown tints prevail in the decoration and finish.

The bath is of white tile and has a tub, W. C., lavatory and shower fixtures of standard white porcelain ware with best sanitary plumbing.

All floors are of white oak, natural finish. The bedroom walls are tinted and decorations stenciled and worked out by hand, in oil. Brown tints prevail throughout the house.

There is room for a large room in attic that could be used either for a playroom or servant's room.

The heating is hot water system. The size of this house is 23 feet 6 inches by 41 feet 6 inches exclusive of porches. The cost was $5,800. The architect is Charles William Eldridge, Rochester, N. Y.

AN UNKNOWN TRADE

By HERBERT

Strange as the statement may seem, it is nevertheless true that one of the most important wood-working trades remains practically unknown. When the name is mentioned people look at you in blank astonishment, utterly at a loss to know just what you mean. Either they have never heard the name before, or, if they have, guess you must have in mind a trade totally different from the right one. I refer, of course, to patternmaking. Often have I met persons who, when told my vocation was patternmaking, displayed either total ignorance, or else asked me if my business was cutting paper patterns for ladies' dresses. To meet a person who does actually know is a rare treat.

How to account for this widespread ignorance is no easy task. Still it does seem as if the most satisfactory explanation lies in the fact that the results of patternmaking fail to make a direct and constant appeal to the public eye. Mention a carpenter and everyone knows in a twinkle you mean a man skilled in all sorts of architectural wood work. Wherever they go, his work stands out conspicuously before their eyes. Speak of a cabinetmaker, and a vision of chairs and tables, of bookcases and bedroom sets looms right up before their minds. Furniture is an ever-present witness to his skill. But when we turn to the poor patternmaker, what about his handiwork? Why, you may walk through the length and breadth of a large city and never discover a trace of his work, unless you accidently happen to stumble into a foundry or pattern shop. Outside of these comparatively few places, his direct handiwork remains in obscurity, a fact which accounts largely for the prevailing ignorance of his craft.

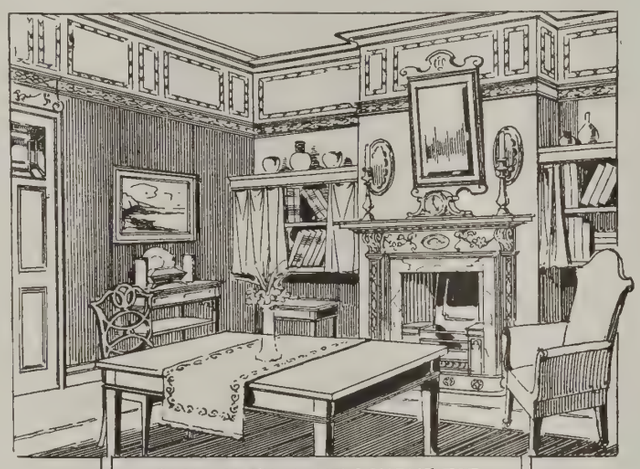
And do you know that this important trade is totally ignored in quarters where one would least expect it? When information is required on any unfamiliar subject, where do we turn to look for it? Naturally to an encyclopedia, which is supposed to contain a library of information on almost every conceivable subject. And yet are you aware that if you consult the pages of an encyclopedia, even, you will fail to find an article on patternmaking? Other branches of the wood-working industry, such as carpentry, cabinetmaking, ship-building, etc., are treated in special articles, while no mention whatever of this subject is made.

Within the past few days the writer has taken particular pains to look into two leading standard books of reference, in hopes of finding something on the subject of patternmaking. Not one syllable did he find. Isn't this strange? Rather isn't such an omission inexcusable—to think one of the most useful, skill-requiring trades should be passed over in utter silence? It is difficult to account for such silence, unless we charitably ascribe it to an unintentional oversight on the part of the editors themselves, or at least of their associates, who, as specialists, are supposed to be acquainted with the various branches of manual work. However that may be, it is sad to think that persons turning to these books for light on this subject are doomed to meet with sore disappointment.

Now, I contend that there is no valid reason for relegating the patternmaker's trade to the background after this fashion. It is deserving of far better treatment. In my estimation, it is the most important of all the wood-working trades, because of its intimate relation to the large and ever-widening iron industry, constituting, as it really does, the very foundation of all these activities.

When a draughtsman, for instance, finishes the design of a machine, giving full details of the various parts of a complicated mechanism, what is the first step taken towards the actual realization of his dream or ideal? Why, the drawings are immediately put into the patternmaker's hands, whose painstaking duty it is to make a full-sized wooden pattern of each separate piece. This done, the foundryman can then proceed with his work and furnish the necessary iron castings for the machinist to build the machine. In fact, the whole machine-building process rests largely upon the patternmaker's skill. The same statement holds good also of other lines of the iron industry, notably stove work and bridge construction. In a word, to secure metal castings, whether iron or brass, for any line of work, these must first be put into the form of wooden patterns.

It appears, then, from the foregoing discussion, that the patternmaker fills a most important gap. So essential in character is his work as to merit far wider recognition. Instead of receiving full credit due to his skill, it seems as though the machinist runs away with the lion's share of the glory. When inspecting a finished piece of machinery, whose intricate parts perfectly fit into each other, all moving harmoniously to perform some specific work, the onlooker is apt to recognize only the man whose skill has brought together these various parts, little dreaming of the poor molder, and especially the obscure patternmaker, whose brain-racking task played, after all, the most important part in the drama.



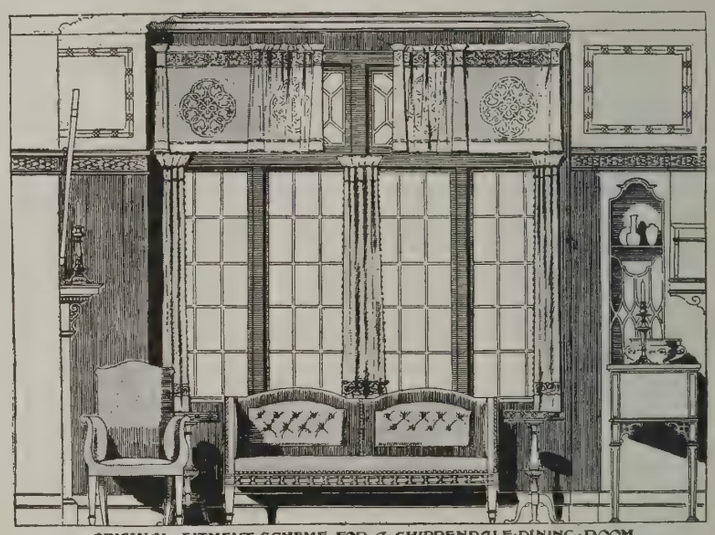
When will we poor fellows, who daily puzzle our heads over blue prints and bewildering numbers, in order to convert lines and figures into tangible, workable forms, be suitably recognized and our work receive its due meed of praise? We have been ignored so long that some of us are really hankering after a little recognition. When shall we receive our rightful heritage?—The Woodworker.

A CHIPPENDALE DINING ROOM

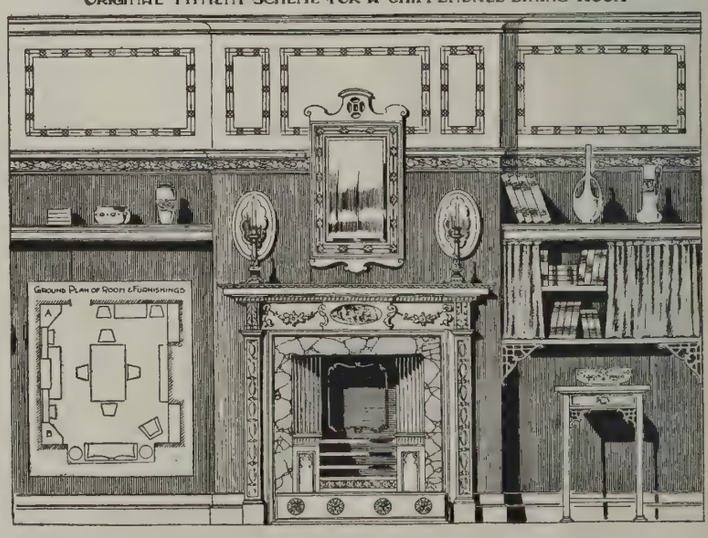
FROM THE CABINET MAKER—ENGLISH

THE TREATMENT OF A COMMON-PLACE INTERIOR.

In using the expression "a common-place" room, we mean to convey the idea of an apartment which has no distinctive features which lend it any interest apart from the furniture and decoration. In such an interior as this the furnisher and decorator is necessarily handicapped. If he has a deep angle or an imposing bay he has the main points of a successful scheme ready to hand, but in the majority of cases in which our readers are called in to give advice the room proves to be an essentially common-place one, and, as often as not, takes a form such as that shown on the small

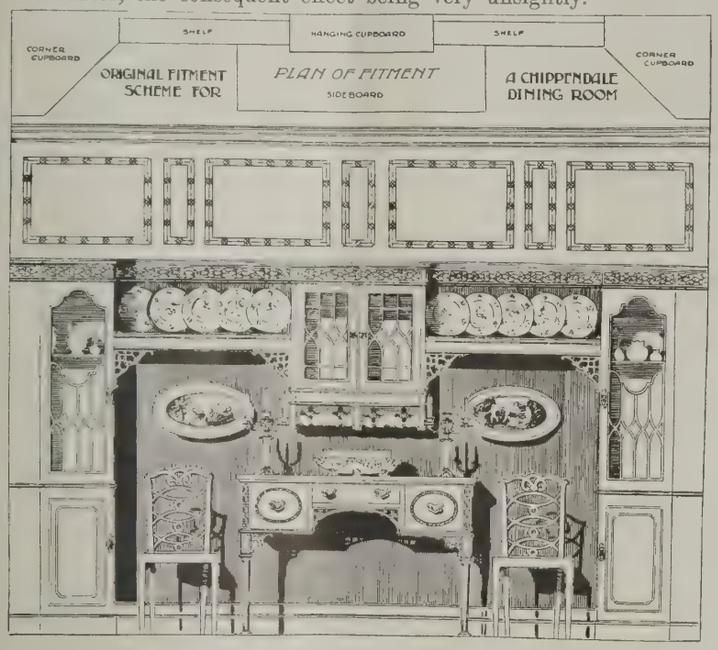


ORIGINAL FITMENT SCHEME FOR A CHIPPENDALE DINING ROOM



plan at the bottom left-hand corner of Figure 3, a regular rectangular space, with the exception of a chimneybreast, which projects some few inches into the room, and a shallow bay window. There are, of course, thousands of persons who are thoroughly satisfied with this arrangement, and who ask for nothing better, but there are also artistic clients who require a distinctive scheme or fitments which shall give individuality to their daily surroundings. Fitments as ordinarily constructed are very expensive for the man of moderate means, but an attempt has been made in the accompanying sketches to design a fitted room on the simplest possible lines. In order that the dimensions of the bay window may not be further contracted, no elaborate draperies have been used, but simple casement curtains are employed, treated with embroidery in harmony with the general color scheme.

Having thus dealt with the only feature of the room which lends itself to decorative treatment, we must decide as to the handling of the other three walls. The one opposite the bay window does not adapt itself to any fitment scheme, because it is on that side that the room is entered. The designer, therefore, devotes himself to the fire-place side of the room, and that opposite it. At the outset let us draw attention to the number of horizontal lines introduced; this principle of horizontality is one which should never be forgotten, as it adds greatly to the homely appearance of the interior. As a concession to science and hygiene, we have made our rooms higher, and it remains for the artist to contrive a scheme which shall prevent the box-like impression, such as is given by a room of undue height. The proper height at which to fix the intermediate cornice, enriched with the applied fret, is determined by the transom between the upper and lower lights of the window, and if this rule is followed the curtains, and frieze form a continuous band round the upper part of the walls of the room. It is surprising, considering how floor space is contracted in flats and small houses, that furniture designed to stand in corners is not more used, as the amount of room gained in this way is enormous. In many instances the corner of a room is occupied by a jardiniere or some useless ornament, whereas a needful piece of furniture might be placed in it, the customary over-crowding so apparent in small apartments being thereby avoided. This is a course which has been adopted in the scheme under consideration, and, we think our readers will agree, with success. Roomy corner cupboards are placed at A and B. The details of capping, frieze and necking moulding are identical with those of the intermediate cornice already referred to, and the height of the corner cabinets is also governed by the line of the same feature and the mouldings intersect each other. The same remarks apply to the glazed hanging cupboard in the center of the wall, and when the latter is further connected with the corner cupboards by the horizontal lines of the shelves, we have the wall clothed with an inexpensive yet very



ORIGINAL FITMENT SCHEME FOR A CHIPPENDALE DINING ROOM

effective fitment. The sideboard is small, being more like the side-tables, so dear to the hearts of eighteenth century designers. It may be argued that this arrangement does not give enough accommodation, but the corner cupboards should supply all requirements in this direction; one of them might with advantage be

fitted with a cellarette. Note the triangular brackets in the Chinese taste which support the shelving; these little additions, small as they are, add very much to the character of the whole. These frets are repeated in the angles formed between the legs and drawers of the side-board. It will be seen from the plan of the fitment on this page that both the shelves and hanging cupboard only project very slightly from the wall. The shelves arranged for books in the recesses on either side of the fireplace call for no explanation here, but we might warn readers against the mistake which is often made of using stuff which is too slight for shelves of considerable width, as the weight of the books causes them to sag in the center, the consequent effect being very unsightly.

Lack of space gives little opportunity for a description of appropriate decoration, but many treatments might be suggested. The woodwork, of course, is in mahogany, and a color scheme which would look well would be a wall filling of plain green, the frieze having either a cream ground with pale green stencilled decoration or a buff ground and rather darker green enrichment. If a figured paper were employed, the frieze should be left plain and tinted cream color.

BLUNDERS IN CONSTRUCTION

By OWEN B. MAGINNIS

The continuance of accidents, collapses, and disasters seem to be a feature of building operation indespensible to their progress, and, as many are caused by error, haste or poor judgment, it is the intention of this article to draw attention to some of the hitherto unnoted causes.

In axiomatic form the following are the most to be deprecated:

Before commencing to excavate, or while excavation is in progress, neglecting to make full borings or test-holes to locate quicksand or water pockets into which workmen are liable to sink or disappear.

Fitting and hanging doors to stairway or elevator wells before the stairs or elevators have been placed, and leaving the doors unfastened or unlocked. This is criminal negligence.

Varying the heights of stair risers, causing accidents and falls, and in not providing good, safe treads for the workmen, or iron stairs or fire escapes. This is as risky as omitting to cover every second tier of floor beams, and should be deemed a violation of law.

Insufficient and loose widths of plank scaffolds and runways on uncovered floors. This is a frequent cause of accident.

Neglecting to provide guard rails and printed warning signs around hod-hoist openings, hatchways, etc.

The flagrant and criminal offense of ordering removed or causing to be too soon removed the centering, cribwork or other false-work supporting terra-cotta or concrete arches. The recent collapse in the new apartment house in East 87th street, New York City, was due to this cause. Four lives were lost by the untoward haste, and the foreman was justly held for manslaughter.

Neglecting to properly and thoroughly brace framed posts and walls, cast or wrought iron columns, freshly laid brick walls, window and door frames, etc., with proper timber joists or beams to prevent straining or injury from sudden impact, jar, wind pressure or the like. This bracing should be thorough to preserve the details plumb and level until the whole work has set.

Overloading the floors or floor-beams by accumulations of brick, steel, wood beams, mortar, terra-cotta blocks, and similar heavy materials, concentrating too much weight on any particular spot. Equal distribution over large areas should be insisted upon. This oversight has caused many casualties, both in the demolition and erection of buildings.

Inefficient shoring, needling or bracing in altering or underpinning buildings, and unskilled workmanship in connection with the same are also to be deplored.

The omission of caissons, dams, cofferdams and sheet pilings, especially in deep excavations or in unreliable compositions of soils. It is taking big chances to assume that even the hardest strata are free from pockets of quicksand, quiescent or spring water. Many accidents and fatalities have resulted from bad judgement in this regard, as in some cases they have developed suddenly.

Not draining the site. This neglect jeopardizes the future safety of a building by keeping the soil moist, rotting and injuring the mortar and materials, by frost and thaws, compelling constant and expensive pumping and hindering the use of the space for working men and materials. If possible, all cellars and sites should be drained by connecting with pipes to street sewers or cesspools.

Building on frozen ground which has been water-soaked. This blunder, unfortunately too frequently made, has been the cause of many walls and buildings falling, causing cracks, bulges and collapses.

The recent enactment of Employers' Liability Laws in various states must perforce compel builders and contractors to supervise their work with greater care and strictness than heretofore and will undoubtedly have a good effect on both mechanics and laborers, as they cannot recover damages on account of accidents caused by their own blunders or oversights. The following is an excerpt from New York State's Law, recently put in force:

Chapter 674.—Workmen's compensation in dangerous employments.

Section 1. Chapter * * * thirty-one of the Consolidated Laws is hereby amended by inserting therein a new article, to be article fourteen-a thereof, to read as follows:

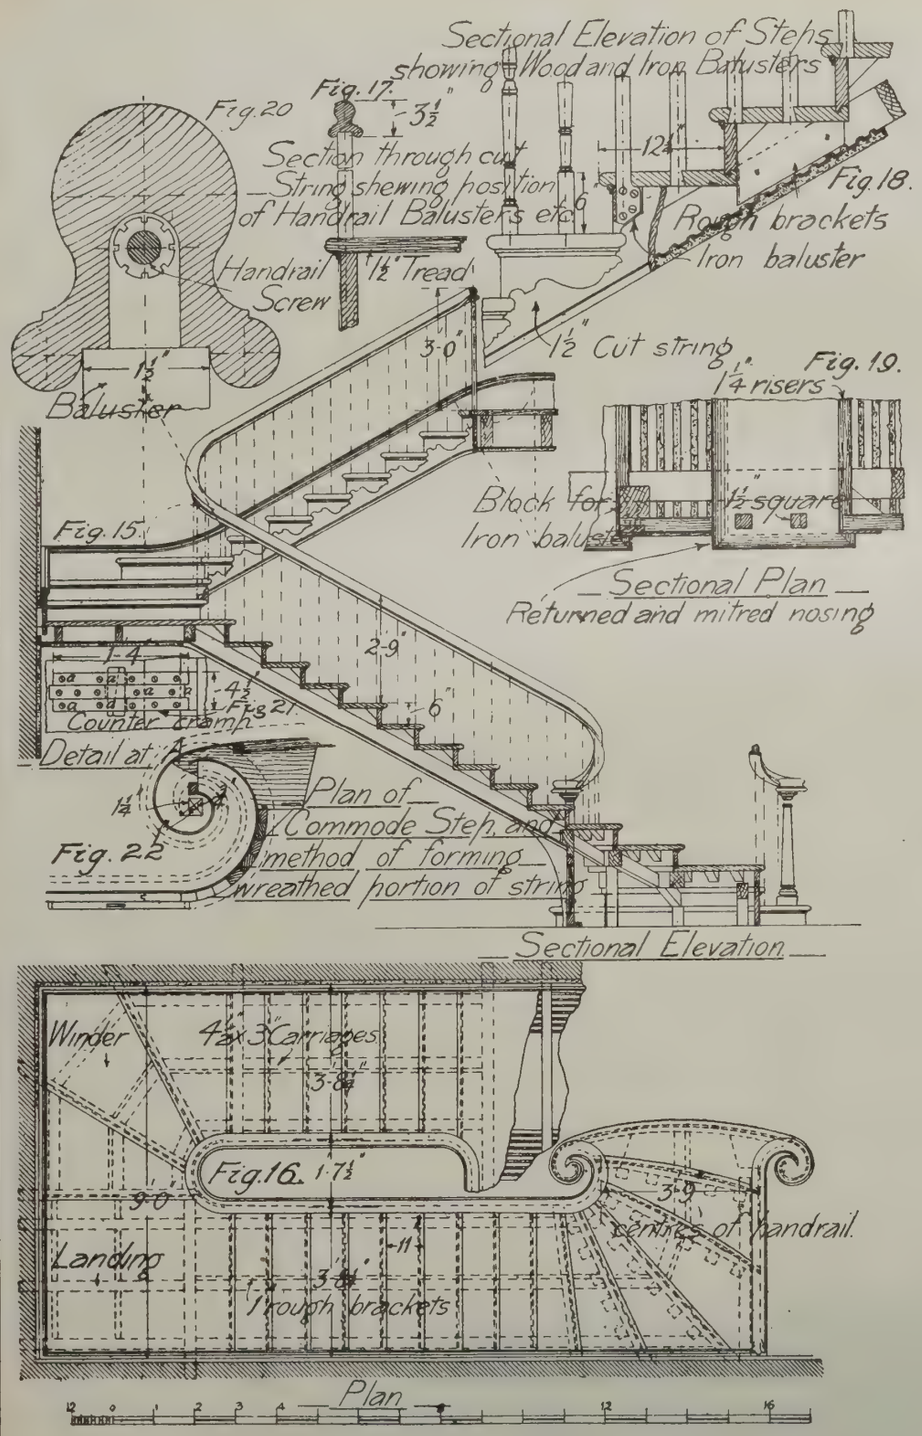
Section 215. This article shall apply only to workmen engaged in manual or mechanical labor in the following employments, each of which is hereby determined to be especially dangerous, in which from the nature, conditions or means of prosecution of the work therein, extraordinary risks to the life and limb of workmen engaged therein are inherent, necessary or substantially unavoidable, and as to each of which employments it is deemed necessary to establish a new system of compensation for accidents to workmen.

1. The erection or demolition of any bridge or building in which there is, or in which the plans and specifications require, iron or steel frame-work.

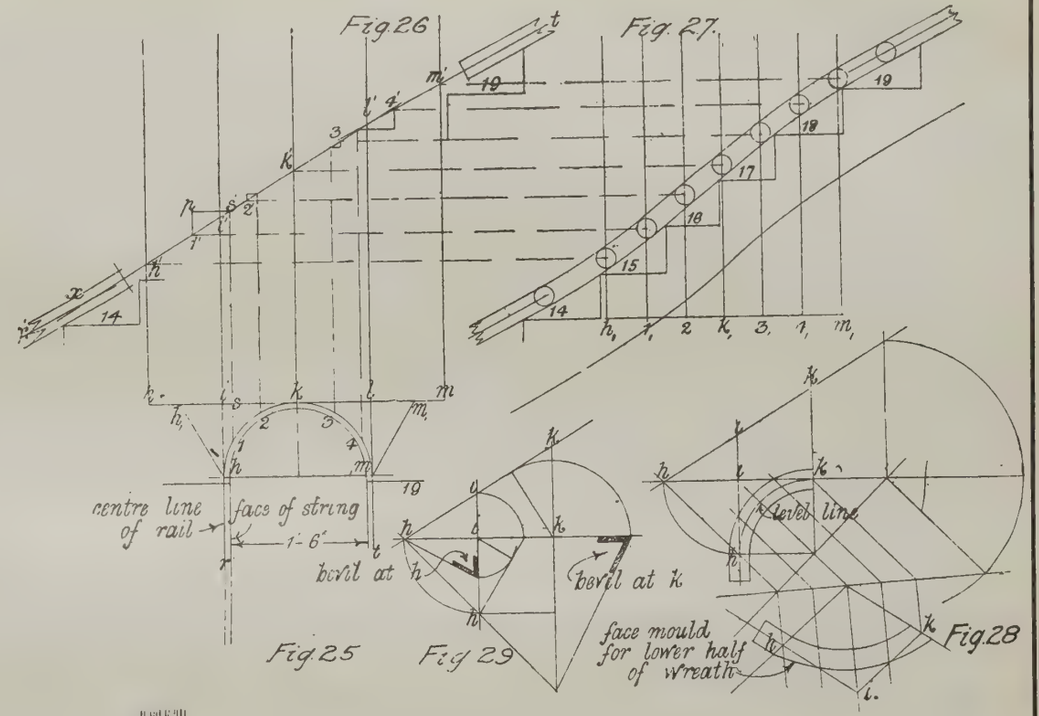
2. The operation of elevators, elevating machines or derricks or hoisting apparatus used within or on the outside of any bridge or building for the conveying of materials in connection with the erection or demolition of such bridge or building.

3. Work on scaffolds of any kind elevated 20 feet or more above the ground, water, or floor beneath in the erection, construction, painting, alteration or repair of buildings, bridges or structures.

4. Construction, operation, alteration or repair of wires, cables, switchboards or apparatus charged with electric currents.



5. All work necessitating dangerous proximity to gunpowder, blasting powder, dynamite or any other explosives, where the same are used as instrumentalities of the industry.



6. The operation on steam railroads of locomotives, engines, trains, motors or cars propelled by gravity or steam, electricity or other mechanical power, or the construction or repair of steam railroad tracks and roadbeds over which such locomotives, engines, trains, motors or cars are operated.

7. The construction of tunnels and subways.

8. All work carried on under compressed air.

Sec. 216. The words, "employer," "workman" and "employment," or their plurals, used in this article, shall be construed to apply to all the employments above described.

GEOMETRICAL STAIRS

By F. T. HODGSON

Figure 161 shows a plan of a type of geometrical stairs with curtail steps, wreaths about wells, quarter-space landing and winders.

Figures 15 to 32 give all the necessary drawings for such a staircase.

The string wreaths are constructed by making a center upon which the portion of string to form the wreath, which has already set out and sunk, is bent and temporarily fixed, face to the center, to which upright staves with radiating joints are fitted and rubbed with glue, and on the unseen internal face of which canvas is glued to increase the rigidity and tenacity.

This when set is released from the center and is cut to the set out marks and tongued to the grooved string as shown in Figure 23. The straight as well as the curved portions of the string are then secured together by pieces of stuff arranged on the gib and cotter principle.

Figure 21 shows such a joint; the screws lettered are those which are fixed after the wedges have been driven home.

Figure 23 gives the plan showing all the necessary lines to set out a curtail step; the block is made in three thicknesses, glued together with the grain at an angle of about 45° to each adjoining piece, to prevent any tendency to split.

The contour of the curtail follows the outline of the scroll, both being set out from the same centers, which in this case are obtained by first drawing a right angled triangle, the perpendicular sides being one inch and 1¼ inches, the other points being obtained by drawing similar triangles, as shown in Figure 23.

Figures 17 to 19 give the plan and elevation, showing the junction of risers, treads, string and straight balusters of the outer cut string. The lower ends of the iron balusters are sometimes forged and screwed to the string, which has a block to strengthen it and receive the screws at that part. The thin ornamental bracket is planted on the string mitred with the riser and covering the baluster end.

HANDRAILING.

The contour of the handrails in dog-legged stairs follows the line of the string, being ramped, mitred, and fixed to newel caps by double-nutted screws, as shown in Figure 7, or tenoned to newels, as shown in Figure 5.

The handrails for open newel stairs are usually straight, and are tenoned and dowelled to newels, the heads of the latter usually being turned. Where handrails are used on the wall side they may be ramped, as shown in Figure 8.

A ramp with a vertical scroll is shown in Figure 24. In geometrical stairs the handrails should be constructed to present a graceful appearance, which effect is best obtained at a minimum cost by setting out the handrails and stairs on the tangent system.

NECESSARY DRAWINGS.

The following drawings are necessary for the production of a rail on the tangent system:

(1) The plan with center line of handrail and tangents, as shown in Figure 25.

(2) The development of the tangents, as shown in Figure 26.

(3) The development of the vertical plane containing center line of handrail, and the face of the string. These are usually in one and the same vertical plan, as shown in Figure 27.

(4) The face mould, as shown in Figure 28.

(5) The bevels, as shown in Figure 29.

TANGENT SYSTEM.

A suggested plan of the stairs is made showing center lines as *hkm,* Figure 25. Tangents, such as *hi, ikl, lm,* are then drawn in plan. The elevations of these tangents are to be determined, and may be arranged in a number of ways; and there will be one set of tangents better than any other, which will satisfy the following conditions:

(1st) The best position of the tangents when developed is that showing them as being tangential to the development of the center line *hkl,* Figure 25 and will occur when the goings on the straight and about the well are equal.

(2d) The next best position is obtained when the upper tangents, as *t′ m,′* Figure 26 are not interrupted, but produced until the second quarter of the plan of the tangents is reached, as at *l′* Figure 26, and the lower tangent *r′ h,′* Figure 26 (the upper and lower tangents being the center lines of the upper and lower straight handrails), is stopped at *x,* a point about 12 inches from the springing line measured on the pitch, and the intermediate tangent is shown in elevation by a line drawn from this point to the point *l′* of the upper tangent.

To obtain the appearance of the rail it is best to develop and determine the plane section of the rail made by an imaginary vertical plane containing the center line of the handrail; and by doing this any defect or cripple in the curve is more readily detected.

Figure 27 shows the development of the vertical lines, *h, h, i, i,* etc., containing the points *rhi2k34mt,* the stretch out of *hm* being without any great error *hm,* obtained by drawing lines 120° to the line joining springing points *hm* till it cut a line tangent with the center point *k* of the curve, the adjoining part outside of the wreath being the same as the corresponding lines in the development of tangents shown in figure 26; and the points in the development of the curve being determined by drawing ordinates as *s—I* in figure 25 and from the elevation of *s′* draw *s—p* equal to *s—I* is a line on the plane containing *hik,* and parallel to *ih,* therefore, s being known, *I′* is determined as shown in figure 26, and in a like manner any convenient number of heights of points can be obtained, and by projecting these heights on corresponding developed vertical lines of the center plane of handrail, the exact developed positions of points in the center line of the handrail may be obtained. Circles are then struck about these points, as shown in figure 27, which are points in the center of the rail. A continuous curved line is then drawn tangent to the small circles, which if pleasing in form should be approved.

The curve of the rail determines the position of the nosing, which should then be drawn, and from which the lines for the setting out of the string is obtained.

Figure 28 shows the method of setting out the face mould for the lower half of wreath, which is the true shape of a section made by a plane containing the center line of half of the wreath and tangents.

The line marked level line is that part at which the rail may be imagined to commence twisting in the opposite direction.

Figure 29 shows the method of obtaining the bevels at *h,* which is the dihedral angle between the oblique plan containing the tangents *hi, ik,* and a vertical plane containing the lower tangent *hi.* The bevel at *k,* is the dihedral angle between the oblique plane containing both tangents and a vertical plan containing the upper tangent *ik.*

Figures 25 to 29 show the application of the principles to the half-turn landing of the geometrical stairs shown in figures 15 to 22.

The method of setting out rail on the dressed plank is shown in figure 30; and of sliding the duplicated moulds to get the twist is shown in figure 31; and the view of the finished portion of wreath is shown in figure 32.

Fast European Express Trains.—Express speeds in Great Britain and on the Continent are high. In Great Britain there are eleven daily express trains making runs of from 50 to 118⅜ miles without a stop, whose average speed is from 51 to 59.2 miles per hour. The fastest and longest non-stop run is 225¾ miles, from Paddington to Plymouth, made at 54.8 miles per hour. France has seven daily expresses that run from 77¾ to 147½ miles without stop at speeds of from 51.1 to 61.8 miles per hour, and there are nine French trains that run from 102 to 147¾ miles without stop at speeds of from 50.4 to 59.3 miles an hour.

Strength of Wood After Long Service.—Evidence that structural timber, if properly protected, does not deteriorate in ordinary service is afforded by some white pine beams, which formed the chords for a timber bridge during eighteen years of service, the bridge being covered during fourteen of these years. Tests of the timber showed an average elastic limit of 3,966 pounds, and a modulus of rupture of 5,208 pounds per square inch. According to W. K. Hatt, of Purdue University, who records these facts in Engineering News, white pine beams of large size are credited with an average modulus of rupture of 5,000 pounds per square inch.

PLANNING A PRIVATE GARAGE*

By HERBERT L. TOWLE

The Problems Involved in the Design and Construction of One's Own Housing for His Car. Suggested Arrangements, Plans and Exterior Treatment Based on What Has Been Done.

Unless one has already owned and operated a motor car, the planning of the first garage is likely to present a number of problems previously unsuspected. How large should the garage be to house comfortably the car and the necessary equipment? What items should the equipment include? What is the practical value of a pit? Is a turn-table worth its cost? Should the garage be heated, and, if so, by what system? Are any special considerations necessary in arrangement of windows? How should the floor be drained? What materials of construction are most suitable, and under what conditions is a portable garage economical?

Before proceeding to answer these and similar questions, let us consider the question of location. One of the elemental things to remember about a garage is that a car must be run in front foremost, and backed out, unless a turn-table or skids are provided for turning it around. The driveway outside is usually wider than the door, and the consequences of bad steering are not so great where the former is concerned.

If the garage is built on a small plot; it is usually best to locate it near the road, with a straight driveway. This latter will need no explanation to one who has tried to follow a serpentine driveway backward on a moonless night, with only the glimmer from the tail lamp to guide him. A driveway is usually an unsightly thing, but an automobile driveway may have its bareness alleviated by eschewing the usual cinders or crushed stones, and laying two cement wheel tracks, about 2½ feet wide, between which grass or flowers may be planted. Of course the tracks must be straight, as otherwise one could not follow them backward, but even then they are less unsightly than a ten-foot S-shaped cinder drive, such as a mistaken idea of beauty sometimes perpetrates in what are, otherwise, harmonious surroundings.

If the garage is some distance from the road, it is advisable to provide means for turning the car around, and on a large place this can be done without noticeable disfigurement. The simplest arrangement is a Y, for a one-car garage, or a gravel court in front of the garage where three or more cars are housed.

Coming now to the requirements of the garage itself, we find that these are determined in large measure by the conditions under which the car is to be used. If the owner lives in a fairly large town, it is not likely that he will wish to do important overhauling on his own premises. Minor work, however, such as tinkering with ignition and carbureter, replacing brake shoes, and miscellaneous work on attachments and fittings, are usually handled with greater convenience and economy on one's own premises. If, on the other hand, the location is a country seat, and if the car is in constant service, it may be advisable to equip for handling all but the most strenuous jobs, without having to send the car to a distant shop.

If a car is to be used regularly in freezing weather, the garage must be heated, and the means for doing this must have careful consideration, because of the danger of fire, if ordinary open stoves are used.

The equipment may range from a bench, soldering outfit and a few scattering bench tools, up to complete facilities for making new parts, and for repainting. In a large garage, housing several cars, one may find not only pit and turn-table, but forge, lathe, shaper, drill press, chain hoist and trolley for taking the motor and transmission, an arbor press and wheel puller for replacing gears, and a separate dustless room for repainting bodies. The heater will probably be found in the basement, reached by outside stairs; and overhead, reached by a staircase not communicating with either storage room or shop, will be found the chauffeur's quarters. In a small garage the cars must, perforce, be washed where they stand, or outside, if the weather permits; but in the large garage an incoming car may be washed on a turn-table directly inside the door, and sent thence to its proper stall, or to the shop in the rear for looking over.

Before deciding, therefore, on the size and arrangement of the garage, one must settle on the usage which the car is to receive, and the proportion of repair work which is to be done at home. The writer classes among legitimate home repairs all minor tire work, all except the most difficult soldering jobs, and in general everything that can be handled with bench tools and a drill. The making of special parts, however, usually requires a lathe or other machine tools, and the amateur does not know how to use these. Such tools, therefore, should be provided only when an experienced chauffeur is to be employed. An emery wheel, however, driven by foot power or by a small electric motor, is essential and a bench drill press run by hand power is almost equally so. Other useful equipment comprises an anvil, vise, assorted drills, taps and dies, a heavy hammer, hack saw, portable vulcanizer, breast drill frame, assorted files, kerosene torch and soldering outfit. For working under the car a low trundle is useful, although seat cushions will serve. An oil tank, underground fuel tank and pump, hose connection for washing, and lockers for tools and clothing are among the things most commonly needed. If repainting is to be done at home, the two-car garage must have a separate body storage room, to avoid dust settling on the newly painted surfaces. In the one-car garage, however, this is not essential, though side space for staging the body is convenient, both in repainting and in overhauling transmission and rear axle. If floor space is lacking, the body may be drawn back a trifle and propped up above the chassis, thus needing but little additional room.

(To Be Continued.)

GARAGE AT "OVERVIEW," VILLA NOVA, PA., BAILEY & BASSETT, ARCHITECTS.

The owners of the garages shown are: 1—Mr. John Phillip, Glenridge, N. J. 2—Mr. Neal Raubone, Beverly Farms, Mass. 3—Mrs. M. C. Post, Englewood, N. J. Don Barber, Architect. 4—Mr. James McCrea, Ardmore, Pa. Bailey & Basset, Architects. 5—Helen C. Chase, Waterbury, Conn. E. F. Benedict, architect. 6—H. P. Benson, Salem, Mass. 7—Mr. William Blodgett, Chestnut Hill, Mass. 8—Mrs. Irene D. Overy, Oak Lane, Pa. C. E. Schermerhorn, architect. 9—Mr. E. Hamlin, Marion, Mass.

A BUILDER'S COURSE IN ARCHITECTURAL DRAWING.

RALPH F. WINDOES.

(Continued from April.)

PLATE X.

LINE SHADING.

In finely finished drawings for exhibition work, catalogues, advertisements, etc., it is often desirable to make the various parts stand out more clearly on the paper. This is especially true of curved surfaces. The effect is obtained by drawing a series of parallel or converging lines on the surface at varying distances from each other. These lines are farther apart on the lighter portion of the surface, and closer together and heavier on the darker part.

Figure A shows a cylinder shaded in this manner, Figure B a hollow cylinder and Figure C a cone. To avoid a large blot at the apex of the cone, each line should be allowed to dry before drawing in another.

Figure D gives us the sphere and it will be noticed that nearly all of the lines on the shaded side are put in the same as shade lines.

Figure E represents the conventional shading of a round, flat surface.

Figure F is given as an example of the use of line shading and it offers excellent practice in the joining of straight lines with curved lines. The curves should be drawn first.

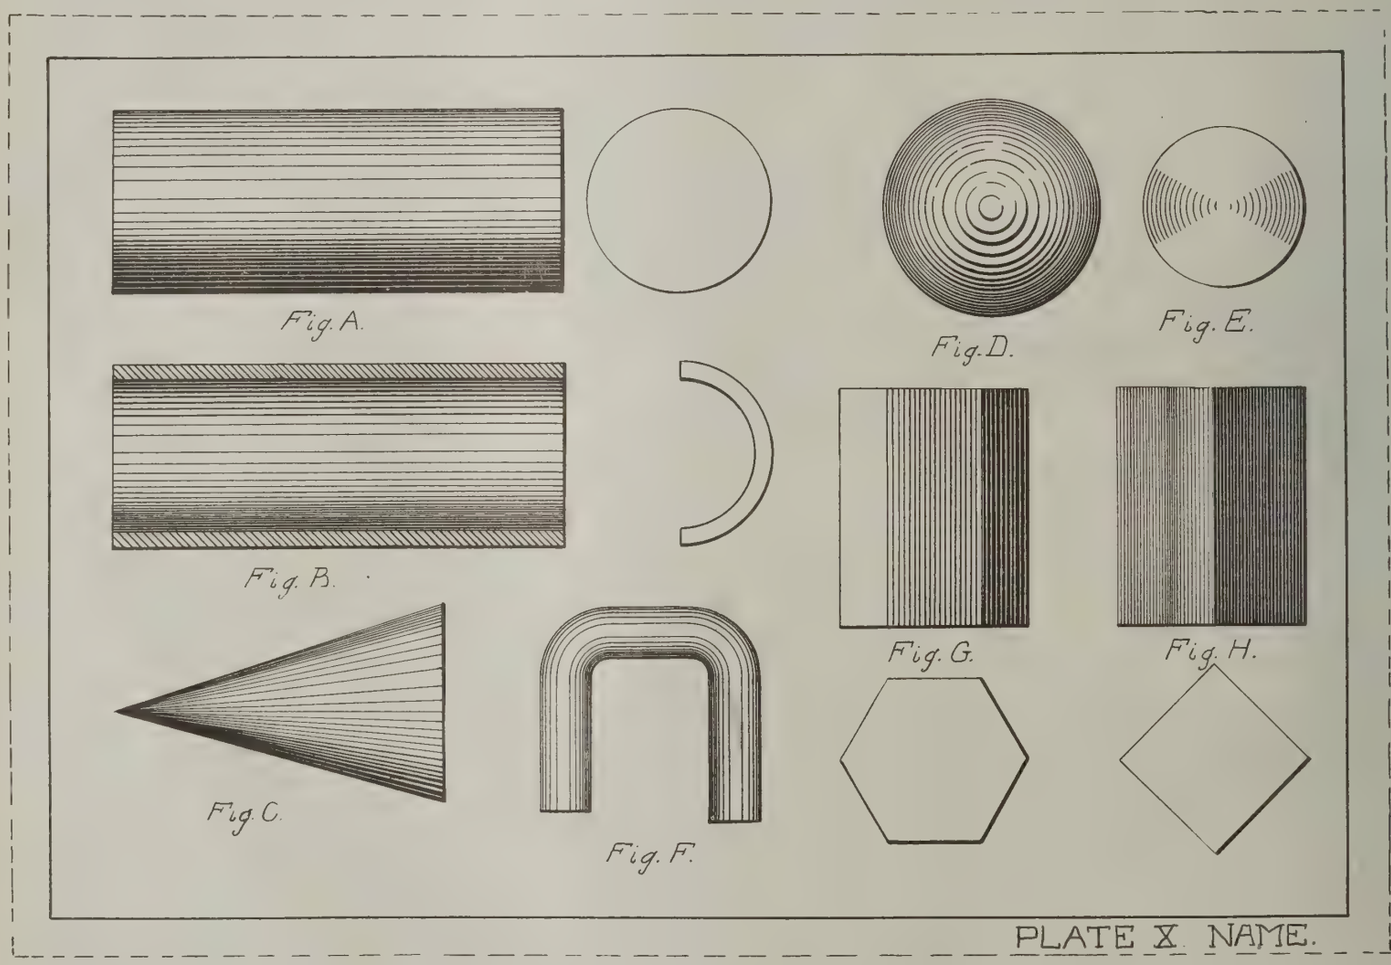

Figure G shows the side elevation of a hexagonal prism, viewed across the flats, and Figure H a square prism viewed across the corners.

If the student has trouble with the plate it is advisable that he redraw it until good results are obtained, as in this, as in other things, perseverance has its reward, and no draftsman can call himself competent unless he is capable of good line shading.

PLATE XI.

PENETRATIONS OR INTERSECTIONS OF SOLIDS.

It frequently occurs in the drawing of details, that one solid is made to intersect, or penetrate, another. There is a line formed at the point of intersection and it is the delineation of this line that will now demand our attention.

In Figure A we have a theoretical fitting for a steam or water pipe. The plan and the elevation are shown. Both parts of the fitting are the same size. To find the line of penetration, proceed as follows:

On the horizontal center line, and a little to the left of the side elevation, construct the semi-circle whose center is o. Divide one-half of it into three equal parts, locating points 1, 2, 3, 4. Project these points up to the horizontal center line of the plan and over to the vertical center line of the elevation. At the intersection of the horizontal center line of the plan with the vertical center line of the semi-circle, place the compass point and draw the arcs as shown. Project these over until they intersect the outside circle of the plan, and locate points 5, 6, 7, 8. Project these downward

until they meet the horizontals projected over from the semi-circle. This locates points 9, 10, 11, 12. Through these points draw a line, which is the line of intersection of two cylinders the same diameter and cutting each other at a right angle. The line a-b is easily located from the above.

In Figure B we have the intersection of two cylinders at right angles but of different diameters. The line of intersection, which in this case is curved, is found in exactly the same manner as the one in Figure A.

It will be remembered then, that if the cylinders are the same size, the line is straight, if of different sizes the line is curved, and that the line of intersection is always found in this way no matter what the size of the cylinders is, or the angle of penetration.

Figure C gives us the plan and elevation of two prisms, of different sizes, which intersect at right angles. It is a very simple problem and no difficulty should be experienced in solving it. Point 2 is the projection of point 1 on the center line of the side elevation. Point 3 is the same with point 4. By connecting these with a and b, the angle of penetration is found. In a manner similar to this nearly every intersection of prisms may be found, no matter what angle of penetration is used.

Figures D, E and F represent the finished elevations of the examples without the construction lines. They afford an excellent opportunity to apply the principles learned from Plate X. They should be drawn about half the size of the elevation above them.

(To be continued.)

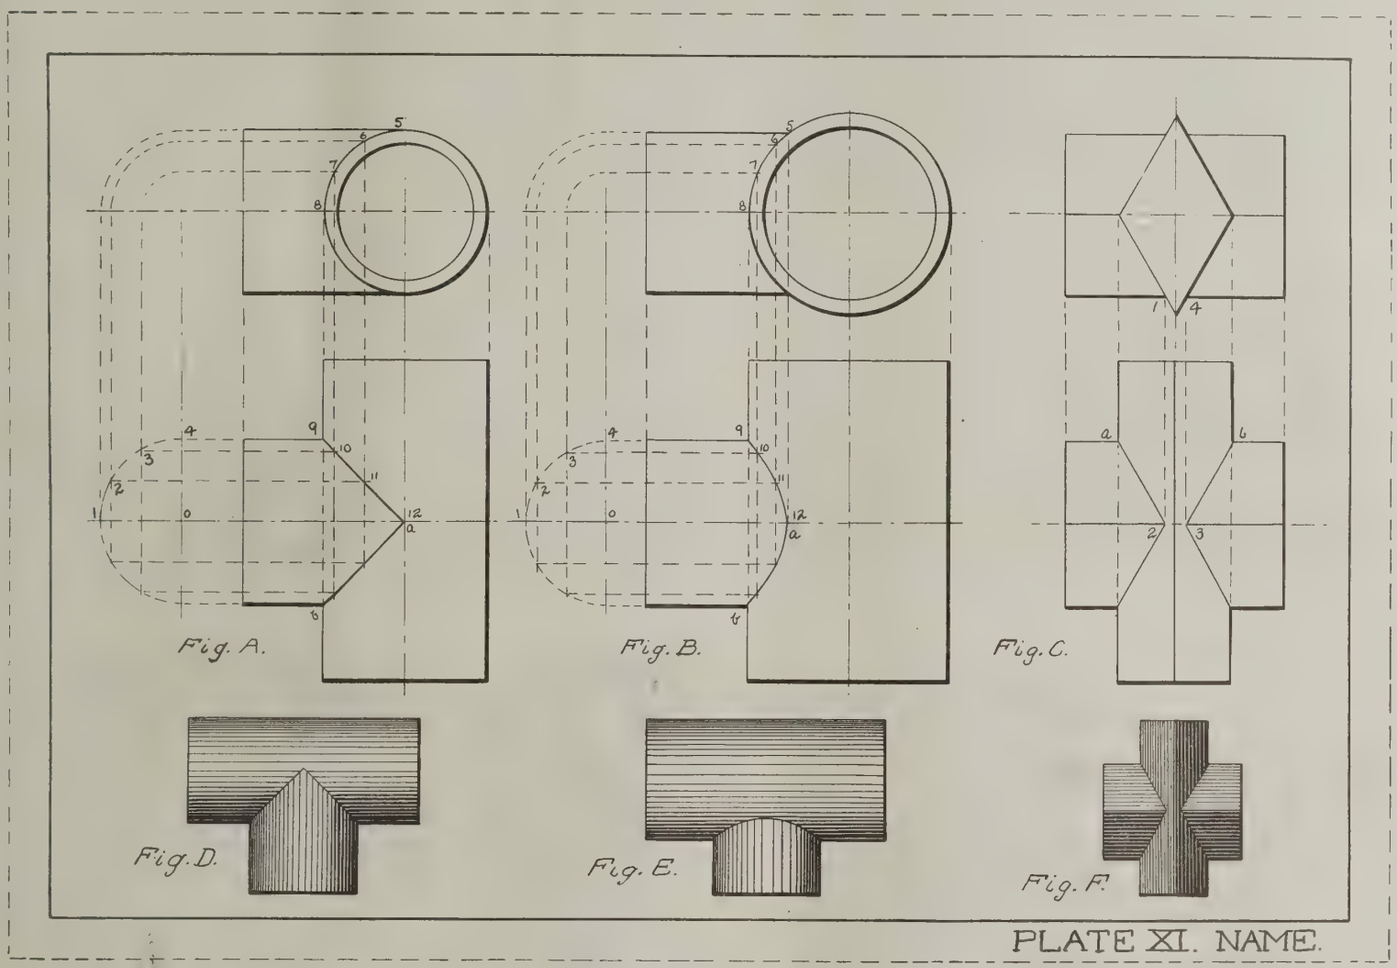

PLATE XI. NAME.

AN EXTRA HAZARDOUS RISK

During the convention of Building Material Supply men, recently held in Chicago, a credit man in quite an extensive talk on credit is quoted as saying, "that the carpenter-contractor should be generally classed as an 'extra hazardous risk.'"

He further stated that the supply man was the contractors' banker, meaning of course, that it was he who supplied the goods or money on long credit which enabled many contractors to do business.

We would understand from this that a consideration is paid to the supply man for this kind act, as he could not himself afford to carry the account on his books for an extended period, which is a risk, unless he got more money for his goods. This may explain why many contractors do not make money, and are always hard up.

It is difficult, we know, to get a banker to advance money on a building contract to a contractor without means, or at least some good collateral; but if it can be done, the contractor will find he is money ahead, and the interest a bank would charge is less by far than the advance price the supply man asks for his goods on an extended credit. Then too, the contractor is foot-loose to shop around to get the best prices for his materials.

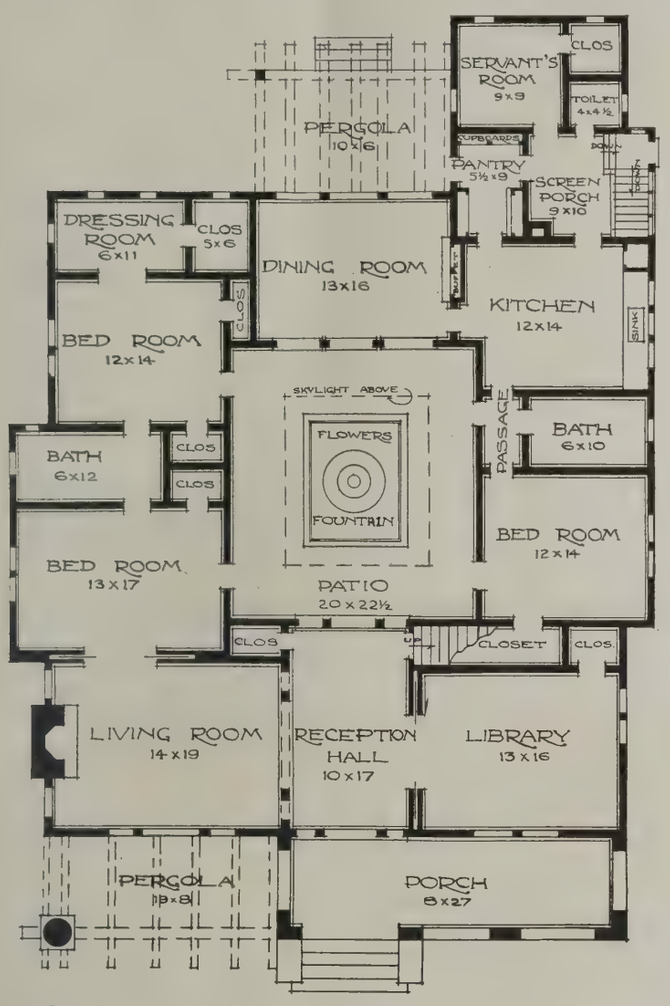
To Imitate Old Oak.—To make an exceedingly rich color for the imitation of old oak, the ground is a composition of stone ochre or orange chrome and burnt sienna; the graining color is burnt umber or Vandyke brown, to darken it a little. Observe that the above colors must be used whether the imitation is in oil or distemper. When dry varnish.

Painting on Brickwork.—If you have a wall of brickwork, and the bricks are very soft, then broom down clean and apply a size of acid water, just enough muriatic acid to sour the water. Let this be rinsed off with clear water, let it dry, then apply all the raw oil the wall will take. This is for a first-class job, and the oil will prevent the chipping of the brick afterwards. The oil makes the soft bricks harder, and also waterproof. Hard bricks will not need so much oil. Where the wall has been filled with raw oil the first coat of paint should be of good quality, and according to what the finish is to be; if to be painted like wood, it should be thinned with oil and turpentine until the last coat, which should be done with all oil. But if a dead brick finish, then use all turpentine color, for the finish, though the priming may be all oil, and the next coat or two, half and half, as the dead effect is surer on a partly lustrous ground, or on a perfectly full luster.

WHILE A ONE-STORY HOUSE, THE TOWER-ROOM IS ONE OF THE FEATURES OF THE PLACE.

NEARLY ALL THE ROOMS OPEN INTO THE PATIO, WITH ITS FOUNTAIN AND FLOWERS.

MISSION STYLE TRIM AND FURNITURE ARE AT THEIR BEST IN THE DINING ROOM.



A SIMPLE FIREPLACE IN THE LIVING ROOM CAN BE SEEN FROM THE LIBRARY.

The One Story House—This style is popular in California, and can be adapted to other sections

THE ONE STORY HOUSE

By L. BAURY

While the low rambling one-story type of house is still peculiarly a product of the Pacific Coast architecture, visitors from other parts of this country who have been charmed by this arrangement of rooms that lends itself so appropriately to requirements of life in a warm climate, are adopting this plan of building for their country homes on the mountains, or at the seashore. Even the patio, which was formerly exclusively Californian, now appears not only in some of the newest Southern houses, but even in the summer homes of many northerners of artistic taste. Unsuitable

as such a house might be for city, or even suburban use, all the year round, nothing more attractive could be designed for those who wish to combine the delights of home with the freedom of life out-of-doors.

In such a house the rooms are usually arranged upon the single-floor level. In the case here illustrated, there is a lounging room in the tower. The house is invariably built around the patio, with its garden in the center, and, in which, if desired, a fountain may also be introduced. It is this room that is really the living room of the house, for, covered by a skylight, the interior, while assuming all the aspects of a delightful garden spot is amply protected against any inclemency of weather. In many houses of this character vines are among the plants placed in the center of this apartment, and they are trained to cover the walls and extend completely around the room.

As may be seen by the plans, nearly every room in this house opens upon the patio, the dining room and reception hall being separated from it by glass partitions. In this way the brightness and attractiveness of the patio extends to other parts of the house —bringing a sense of proximity to Nature, with which people of the north and east have long been unacquainted in their homes.

The front of the house is made attractive by a partially enclosed porch and a pergola. The porch opens into a large reception hall from which there are doors to the library and parlor, or living room. Here a large open fireplace, built into the outside chimney, furnishes an artistic touch that is most attractive. The arrangement of the bedrooms in this plan, with the conveniently placed baths, and numerous closets, cannot fail to commend itself to those who are looking for comfort as well as economy of space. The arrangement of the service wing, which shuts the kitchen with the pantry and servants' rooms, completely off from the rest of the house, is a feature that, while typically Californian, might well be duplicated in houses in other parts of the United States.

All the rooms are of good size, have plenty of windows, and, of course, hardwood floors throughout. While the house is not designed especially for year round occupancy, it is provided with a furnace from which heat may be obtained during the few weeks in the year when the ordinary summer home becomes too cold for comfortable habitation. At the same time, there is no reason why such a plan should not be adopted by those desiring to build a permanent home, providing the lot is large enough to accommodate a structure that requires so much land.

The house which the accompanying photographs show is built of stucco and is covered with a red-tile roof. The tower extends to a height of about fifteen feet from the roof-level, and is also covered with red tile. It is reached by a stairway which leads from the reception hall, and this is regarded by the owners as one of the most attractive features of this house.

The detail cost of this building is as follows:

Masonry, cement work and plastering	$1,025.00
Lumber	1,100.00
Doors and sashes	250.00
Hardwood floors	210.00
Skylight for patio	150.00
Carpentering work	640.00
Tile roof	450.00
Plumbing	500.00
Hardware	100.00
Furnace	125.00
Electric wiring	50.00
Painting	300.00
Total	$4,900.00

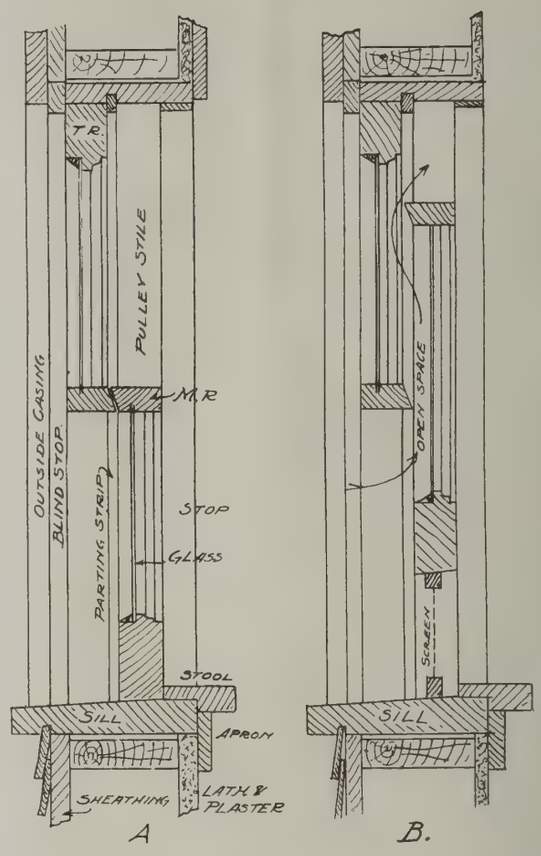
THE BUILDER AND THE AUTO

THE auto, not so much the big touring automobile for pleasure and for show, but the auto truck and light delivery wagon is going to be a factor in the affairs of the up-to-date builder in the next few years and it is a subject enterprising builders should be taking up. The man that gets into the game first may pay some extra price for having to carry on experiments, but he will get the extra advertising and reputation for enterprise that will give him prestige in the community, so it is worth while sometimes for a man to indulge in a new automobile to ride around in for pleasure is simply to create adverse criticism, but for a man to get an auto wagon of a type fitted to his own work instead of his regular horse and spring wagon is to show a kind of enterprise that will be appreciated. Already in some localities these are being seen and soon it will be builders, plumbers, tinners, and all kinds of trades people who need wagons operating motor wagons of some kind or other.

The automobile people are giving special attention now to the commercial side of the business. That is, to the making of commercial cars, trucks, and lighter vehicles and it is worth while for every builder to give the subject attention, too. They should prove both a convenience and a step in progress. They need not cost much more primarily than a good horse and wagon and no more to operate, and they should be less trouble. So, make inquiries and get literature on the subject and keep up with the times in connection with commercial auto wagons and see if you can be a sort of leader of this progressive movement in your community.

FIGHTING THE HOUSE FLY

By WM. C. A. STEVENSON



We are now face to face with another season of fighting the house fly. The several Boards of Health have been warning the people of the deadly disease germs carried by the fly from the garbage barrels, etc., into the house and onto the food stuffs.

It is therefore up to the householder to see that his house is properly protected from the invasion of the fly. In order to do this successfully, the screens must be properly fitted; the doors should have good heavy spring hinges on them, so as to throw them shut as soon as a person passes in or out. The door should always spring outward, for this reason: The flies light on the wire on the outside and if the door swings in when it is opened, they leave the door into the house. This is one of the bad features in double swing doors, as sometimes used on store doors, etc.

But when the door swings outward and the flies are on the wire, when the door is opened, the motion of the door scares them away and they do not return before the door has closed if good hinges are used to throw the door promptly shut.

Window screens should be the full size of the window and made to fit in place of the storm sash, if the storm sash are hung with patent hooks, these will also do for the screens. When the screen is made to fit the full size of the window, either sash can be opened at will and you still have screens in the window. A screen that only raises the lower sash up part way and sets under it is about as good as no screen at all. To prove this fact, I will draw attention to the illustrations herewith shown. (A) shows a section of the sash of a window when closed, Br the bottom rail of the lower sash Mr the meetings of the upper and lower sash, Tr the top rail of the top sash.

(B) shows the lower sash raised up part way with a screen set under it: note the space between the meeting rail of the upper sash, allowing the flies to light on the glass and crawl up and over the top of the lower sash as indicated by the arrow points. Carpenters, it is up to you to point out this defect in this narrow screen to your customers, and show them the necessity of having window screens made full size.

HOTEL McALPIN

PUSHING rapidly ahead, work is now under way on the Hotel McAlpin, to be the largest hotel in the world, and to stand at Thirty-fourth street and Broadway, now admittedly the heart of New York City.

The Greely Square Hotel Company, the owners, are promised by the builders, that the giant new structure will be completed within a year, and the present plans are to open it in Setpember, 1912.

Fortunately New York has a solid rock foundation and once the fundamental excavation is ready her great buildings grow up like mushrooms. The new hotel gets its name from the McAlpin estate which owns the ground on which it will stand, the 30,000 foot block fronting Broadway on the east between Thirty-third and Thirty-fourth streets. It will stand twenty-five stories tall including the pent house on the top which will shelter the machinery.

The plans, to quote the architect, Mr. F. M. Andrews, are as follows:

"We are erecting a structure twenty-five stories in height, with a close adherence to the style of the Italian Renaissance in architecture. There will be 1620 guest rooms, 1100 bath rooms, and some two hundred large and small rooms devoted to the use of guests and servants. The dimensions will be 202 feet on Broadway, or the entire western face of the block, running east of Thirty-fourth street 150 feet, and the same distance on Thirty-third street. The material is Bedford stone for the base, and the main shaft of the design in golden brown brick, while the upper portion of the design is to be carried out in this brick and colored terra-cotta. Such are the plans that to every bedroom light and air will have free access, and every room will have its bath or en suite to be connected with a bathroom, and more space is to be allowed to rooms than to any new hotel of large size built in New York for a great many years.

"Taking the various notable public rooms there is first the lobby, the largest of its kind in the world. Its height is fifty feet and its width is 64x96 in length. It is designed in the Italian Renaissance, executed in Paonozza marble and a polychrome terra-cotta that in the model has elicited high praise from the best critics. At the mezzanine floor level will be balconies overlooking the lobby. The entrances will be on Thirty-fourth street, Thirty-third street and Broadway.

"The banquet hall is to have a vaulted ceiling of unsually ornate effect and the length of the room, 80 feet, with the high arch and the extreme narrowness 32 feet, all go to make it very unique and impressive. This room fronts on Broadway and is matched on the south by the ladies' tea room and restaurant, 30 by 65 feet with a ladies' reception room 30 by 30 adjoining, while on to the east is the general writing room and library 30 by 45 feet. To those familiar with the dimensions of similar rooms in American hotels it will be apparent that the public cannot fail to appreciate such generosity in costly space. All of these rooms will be decorated in the style of the North Italian Renaissance with the exception of the ladies' reception rooms which will be carried out in Louis XVI style.

On the second floor are some unusual features, for instance a lounging room for men 65 by 96 feet, and here will be the private dining rooms very handsomely executed. The nearer the guests' table is to the chefs' range the better the service, the hotter and more appetizing the food. This is a truism among hotel men. The kitchen of the McAlpin will not only be the largest in New York City, but it is located immediately under the dining rooms and waiters and trays ascend and descend by escalators, reducing transition time to a minimum.

In order that the right idea of the great size of the Hotel McAlpin may be properly conveyed, permit me to quote some of the startling figures in the specifications. The area of the plot is thirty-thousand square feet, the estimated cost over all is about $14,000,000, the private telephone exchange is the largest ever built, being thirty by 120 feet; there are seven miles of heating risers, mains and returns, and one hundred and fifteen miles of electric lighting wires. The tubing in the hotel will be three and one-fourth miles in length.

A METHOD OF SETTING OUT A CURVE

To set out a curve in a road, footpath or curb gracefully is no easy task. The accompanying drawings illustrate a simple instrument by which a curve of any radius from 10 ft. to 60 ft. can be set out which will not have the irregular effect too often seen. It is based on the platelayer's method of setting out a curve without a theodolite, by offsets from equal chords.

The instrument is constructed similar to a tee-square, and shown complete in Fig. 1: A is an oak lath, ⅝ in. thick, 3 in. wide, and 7 ft. 4 in. long; at one end is fitted the cross-piece B, of oak, ⅝ in. thick, 3 in. wide and 3 ft. long. The two pieces are halved and fixed together with screws, and must be perfectly square. Over the arm B is placed the slider D, with pointer and notch for an ordinary ¼-in. diameter chain arrow. The slider is a band of sheet brass, $\frac{1}{16}$ in. thick, 1½ in. wide, and bent to slide over the arm, and should be a good fit. On the face of the band is soldered a strip of sheet brass 3 in. wide and ⅛ in. thick, the edge on the inside projecting ½ in. beyond the edge of the arm. A square opening, ½ in. wide, is cut in the center of the brass plate, exposing the scale, and at the middle of this opening is soldered a pointer. The notch E for the chain arrow is cut with a ¼-in. diameter round file; the center of the notch must be perfectly in line with the pointer, and cut to a depth to allow the arrow to bear against the edge of the cross-arm B. On the outer edge of the slider is soldered a strip of brass ¾ in. wide, 1 in. long, and ¼ in. thick, and at the center of this strip is drilled and tapped a hole for a ¼-in. clamping screw. This screw is to fix the slider when set for laying out a curve of given radius. On the face of the cross-arm is a scale C, divided into inches and decimals of an inch. The scale is either painted direct on the arm, or on paper pasted on and varnished. The scale is adjusted so that when the slider is close against the long arm, the chain arrow against the long and cross-arm in the angle G, the zero of the scale is immediately under the pointer. A brass plate F, ⅛ in. thick, 1½ in. wide, and 3½ in. long, is fixed with screws on the long arm; the center line of the plate must be exactly 3 ft., and ¼ in. from the inner edge of the cross-arm. On the center line of the brass plate a slot, ¼ in. wide, is cut with a ¼-in. round file. The slot is cut to the edge of the long arm, to allow a chain arrow to rest against the edge of the arm. Great care must be taken that the slots are cut to the dimensions, for on this the accuracy of the instrument depends.

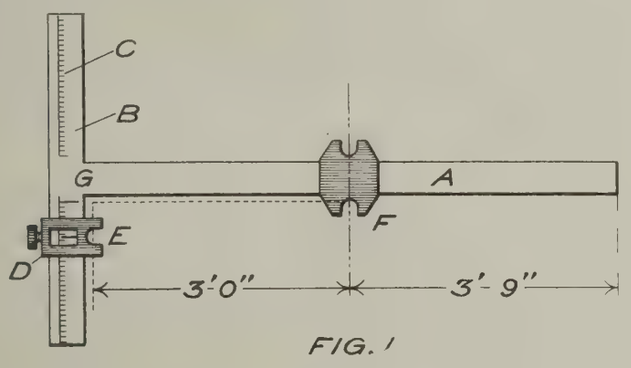


FIG. 1

Before the instrument can be set to lay out a curve, the radius of the curve to be laid out will have to be found by the rule: $\frac{C^2}{v} + v$, where C equals the half of the chord and v the versed sine, or the height of the curve, at the center of the chord.

Fig. 2 will explain the method of finding this data in actual work, H E being an assumed curve to be laid out. Stretch a line from E to H, the commencement of the two ends of the curve; measure this length, the half of which will be C in the rule. From the center of H E, measure to the point L, the highest point of the curve; this height will be v, or versed sine in the rule.

Assuming H E to be 40 ft. long, and the length V L 10 ft., the radius of the curve will be $\frac{20^2}{10} + 10 = 50$ ft. The radius of the curve being known, the half-length of the offset from the tangent will be necessary, which is found by the rule $R - \sqrt{R^2 - L^2}$, where R is the radius of the curve, and L the length of the tangent, or the length of the arm of the instrument from F to G in Fig. 1. The half-length of the offset for a radius of 50 ft. by this rule will be: $600 - \sqrt{600^2 - 36^2} = 1.08$ in. In the working of this rule, all dimensions are reduced either to feet or inches; in the example they are reduced to inches.

The following table of offset lengths is for a 3-ft. tangent, for radii from 10 ft. to 50 ft., calculated by this rule from which an extended chart, giving intermediate radii can be set out on squared paper, thus avoiding calculating offset lengths each time a curve is set out.

Radius ft.	Half Length of Offset in.	Full Length in.
10	5.53	11.06
15	3.64	7.28
20	2.44	4.88
25	2.17	4.34
30	1.8	3.60
35	1.55	3.10
40	1.35	2.7
45	1.20	2.4
50	1.08	2.16

The most convenient chart would be the half-length offset, and for the full length it is simpler to double the values in the chart.

The length of the first offset, P N in Fig. 2, where the curve starts from the straight line, is the length found by the rule, and is half the length of the succeeding offset R Q.

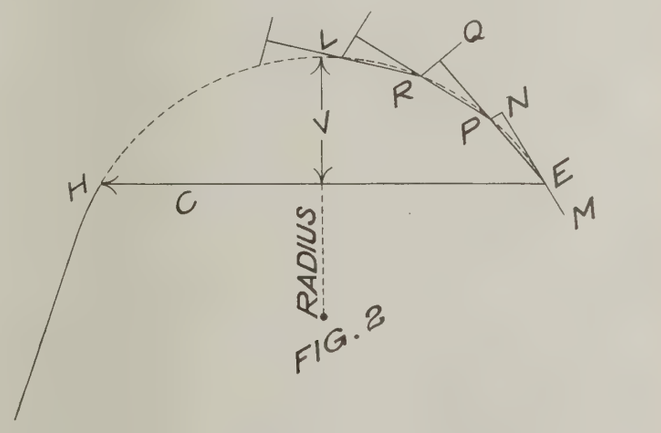

FIG. 2

To set out a curve, an arrow is driven in at the start of the curve at E, and another at M, 3 ft. back on the straight line. The slider on the cross-arm is set with the pointer over the half-length of the offset, corresponding to the radius of the curve. For instance, taking the radius as 50 ft., the pointer is set at 1.08 in. from the edge of the long arm, but if the radius of the curve to be laid out is 10 ft., the pointer is set at 5.53 in. The inside edge of the rod is placed against the outside of the arrow at M, with the arrow E in the slot of the brass plate F (Fig. 1); the arrow must bear tight against the edge of the instrument. A third arrow is now driven through the slot in the slider of the cross-arm; this arrow will be the first point on the curve at P in Fig. 2. The next step is to alter the length of the offset to its full length, which for a 50-ft. radius curve is shown in the table to be 2.16 in., and for a 10-ft. radius 11.06 in. In the next position of the instrument, its edge rests against the outside of the arrow E and the arrow P in the slot F of the instrument. An arrow is inserted in the slot of the slider, which will be the second point, R, of the curve. Proceeding in this way, a series of arrows is driven in until the opposite straight line is met. The arrows being only a little over 3 ft. apart, the curve can easily be completed between the arrows without deviating much from the correct curve. In using the instrument, care must be taken that its edge be tight against the arrows, and the arrow at the cross-arm driven in with its edge touching the cross-arm in the slot of the slider. Instruments for setting out curves of larger radius are constructed by increasing the length of the arm between G and F (Fig. 1) and the other parts proportionately, a table of lengths of offsets being calculated to suit the increased length of arm.—L'Ingenieur in Building World.

OUR READERS' PAGES

ANSWERS

ESTIMATING.

From Old Reader, Toledo, Ohio.

Replying to H. H. Hoel, Roanoke, Va.

In estimating excavating, a great deal depends on the nature of the soil, both for the unit cost of excavating and for the amount which will have to be taken out. Earth, sand and gravel can be taken out for 25 to 35 cents per yard, clay 30 to 50, while rock will sometimes run to two or three dollars a yard.

A compact soil, such as rock or clay, can be excavated close to the required size, while loose soils will cave in, requiring sheet-piling or extra excavating.

For ordinary work, where the depth is not too great, assuming the excavation to be two feet larger all around will take care of the extra work about the excavation. Thus, for a building 30x50x 10 feet deep would be 34x54x10 = 18,360 cubic feet or 680 yards. For average soil with some clay, at 40 cents per yard = $272.00. This provides for carting only a short distance, any additional cartage to be extra.

In estimating brick work, a wall is always a certain number of brick thick, three brick making a little over twelve inches thick, and called a twelve of thirteen inch wall, according to locality. One of the best methods is to reduce everything to square feet one brick thick and then multiply by the number of brick to the surface foot. This varies from 6 to 8, according to the size of the brick and the method of laying, width of joints, etc., but 6½ or 7 is about the average. Thus a wall for a building 30x50x19 feet high and three brick or 12 inches thick would be 30 + 50 + 30 + 50 = 160 × 19 × 3 × 7 = 63,840 brick.

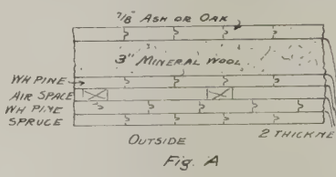
Weatherboarding is usually sold by the square foot, the unit measurement being the amount required to cover one square foot. Thus for the above building would be 160 × 19 = 3,040 feet to cover. By specifying "to cover 3,040 square feet" the lumberman will know exactly what is required. For flooring, the amount required would be to cover 30 × 50 = 1,500 square feet. As the width of flooring varies, it is usually sold by the "board foot," so that a 6-inch board only covers 5¼ inches and the 6 inch must be paid for. It is therefore necessary to add one-seventh for this width of flooring, so we would have 1,500 + 214 = 1,714 feet board measure. In like manner 2¼-inch face would require one-third to be added. A little should also be added to make up for cutting and matching and waste, and while this sometimes will run as high as ten per cent, the average will be less than five.

CIRCULAR FORM.

From Subscriber, Pittsburg, Pa.

In reply to W. H. Parsons, Miltonvale, Kans.

In building forms for circular work, one of the best methods is to cut templets or centers out of any old pieces of wood or plank, nailing them together to form the approximate curve, and then sawing out as closely as possible to the exact curve. Then take strips of galvanized iron as wide as the height of the step and tack to the face of two of the centers, one for the top and one for the bottom. This will give a good smooth surface for the cement to finish against. The back of the step may be finished the same way, but as much care is not needed where the work will not be exposed when finished.



The concrete should be put in rather wet, and carefully trowelled or spaded against the iron so as to remove any stones from the finished surface. As soon as the concrete is set, and before it is too dry the front form should be removed and the surface trowelled and floated off to a smooth finish. When the work is put in in the morning it is sometimes necessary to finish the work the same evening, although it will usually be all ready the next morning. This is a good method to use for putting in curbing where the corners are curved to a rather small radius.

REFRIGERATION.

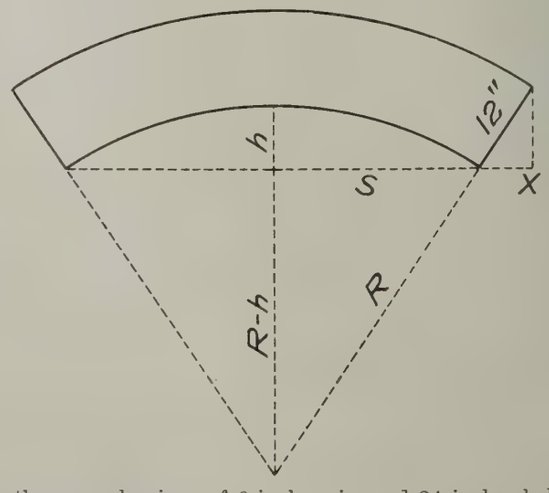
From C. A. M., New York, N. Y.

Replying to F. X. Laliberts, Southbridge, Mass.

Every manufacturer of refrigerators has his own ideas on the construction of his work. A box about the size mentioned was recently built with walls and top made according to drawing "A." It is to be noted that there are ten thicknesses of paper and 4⅛ thicknesses of wood, besides the mineral, and with regard to mineral wool, the directions of the manufacturers must be followed and care used not to compress the wool too much, or the fibers will be broken and the wool will mat down, leaving an undesirable air space at the top. Neither should it be allowed to get wet after being filled in place, as that also has a tendency to mat it down.

The writer believes cork to be a much better insulator, used as shown in "B." Care must also be taken that all air spaces are divided up into small blocks not over 12 inches square by 1x2 strips. This prevents a circulation of air, which will greatly decrease the insulating qualities. The paper used should be that made especially for insulating.

SKEW BACK.

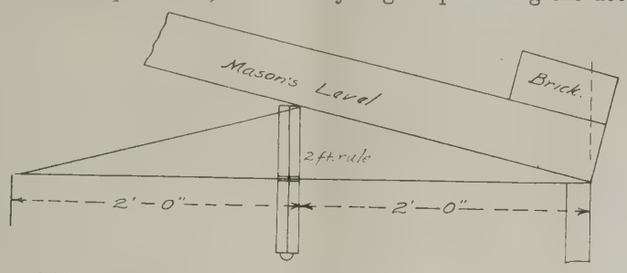


From C. O. P., Fort Barrancas, Fla.

On page 43 of your March number a bricklayer asks for a formula to find inclination of the skew back for a simple arch when span and rise are given. The following formula gives the exact face or horizontal drop-back for an arch 12 inches deep, for any span and any rise.

x = face in inches (see diagram).
s = half span in inches.
h = rise in inches.

$$x = \frac{24\ s\ h}{s^2 + h^2}$$ or in other words multiply the product of the



rise and half span by 24 and divide the result by the sum of the squares of the rise and the half span.

In the example given of 6 inches rise and 24 inches half span, the face is 5 2-3 inches.

From E. A. G., Phoenix, Ariz.

In your March issue the question was asked by a brick-layer, how to find a bevel, when rise and run was given—"no time for paper and pencil." The mason always has a two-foot rule in his pocket, and a mason's level at hand. I am a carpenter, but had I been in his place, my solutions would have been as below: Using a rule for obtaining 6" rise, as per drawing; a level for a straight edge, with a square end, and the "eye sight" producing the dotted

lines which appear on this paper. The brick, of course, can be stood on end with the same results. These are not for the draftsman, with his geometry, but are for the "occasion" no paper or pencil, and no geometry, that he realizes.

QUESTIONS

DORMER EYEBROW.

From M. C. K., Ridgefield, Conn.

Could you, through THE NATIONAL BUILDER, give me a working sketch of an eyebrow dormer?

What I would like is to be told the way to construct it to get it perfect in shape. The roof is to be shingled and the ridge of dormer is to be level.

LUMBER SYMBOLS.

H. A. B., Cleveland, Ohio.

Will you kindly inform me what the following expressions in lumber signify:

18,803', 8" 1 VV Siding.

12/10; 30/12; 53/14; 301/16; 687/18; 490/20.

Also this expression: SISIE?

MISSION SETTEE.

From H. Schrott, St. Louis, Mo.

Will some reader be kind enough to give me full particulars of how to make and finish a Mission settee, in the future numbers of "Our Paper"; also, how to solder copper, and oblige a subscriber?

HOW TO CONSTRUCT A FLAT ROOF.

From John N., Rochester, N. Y.

I would like particulars of the proper method or methods of constructing a flat roof for a building 32x48 feet on the plan? Any information on the subject will be gratefully accepted.

STEEL SQUARES.

From "Young Framer," Seattle, Wash.

I would like to hear from my fellow readers, their opinion regarding best make of steel squares? I have an old square, which I bought along with other old tools from the widow of one of the first settlers in this country. The square has stamped on it, "Eagle Square" and seems true and in good order, but has not the figures on it that I have seen on some of the squares East. Does anyone know of this make of tools, and is it reliable for general use? Any information on the "square" and the manner of using it, will be appreciated very much.

INLAYING TABLE.

From R. M. A., Asbury Park, N. J.

Thinking possibly some reader would give me a little information on a task which I am about to begin, I am writing you in regard to where you think is the best place to purchase material?

I belong to the Local Lodge of Knights of the Golden Eagle, and wish to make a table inlaying an eagle, using a variety of woods, or if you could give me a better idea about the same, to bring out the natural color of the eagle as near as possible, or would you think it best to make the eagle of one piece of wood, using some curly wood in preference. My idea was to make the legs and rails of the table of quartered oak, the table to be about 5 ft. long and about 30 in. high, and to lay an under top on the same principle as a double flooring in houses, so as to prevent the under top from shrinking and drawing the inlays apart. The reason I think this way is best is I have made two tables with inlaid tops, using white pine bats tongue grove 6 in., and as they spread through, possibly by laying the double flooring the under one on the diagonal would prevent the top from shrinking, which, of course, draws the inlays apart.

In regard to size of eagle, I borrowed a design from a friend on black and white, which is about 11½ in. wide spread, and 5½ in. high. I thought it would be about the right size in accordance with the size of table.

I received a catalog from Johnson's Wood Dye Trim, which gives some very good border ideas, and I think I can find one to harmonize with the design. My idea is, also, to get as much variety of wood as possible, as I intend to inlay the bottom shelf; the table will be on the order of a library table.

If possible, would like to inlay the letters K. G. E., used in the eagle design, and also the swords if you think it possible.

If you could recommend me as to where I could purchase a variety of woods thoroughly dry for inlaying, would be greatly obliged to you. They need not be over 2 or 3 in. wide and a foot or so long, and ¼ in. thick—such scraps as one would find in a good cabinet shop, etc.?

My idea for inlaying, or at least the way I made the other tables was by cutting most of the inlays in a mitre box and inlaying with a good oaking glue.

Would thank you very much for any suggestions you could offer me. Am going to try and complete same by next December, 1911, if possible, and if it turns out successful, will send you a photo of same for your valuable paper, THE NATIONAL BUILDER.

BUILDING REFRIGERATORS.

From F. X. L., Southbridge, Mass.

I should like to gain information on the building of refrigerators, for instance, say one about 14x18 ft., and about 7 ft. high?

DIVIDING GIVEN ANGLES.

From W. G. L., New Haven, Conn.

I should like to know the most accurate and easiest way of dividing a given angle into a given number of parts as 3 or 5, etc., all equal?

HIP RAFTERS.

From H. C., Mansfield, Mass.

I would like to ask questions on rafters. Now, I have a hip roof house. I can frame all the rafters and get all cuts, but I cannot get the joint on the hip rafter to come right with the common rafter. Would like someone to give me some idea?

ESTIMATING BY THE CUBIC FOOT.

From J. L. K., Staples, Minn.

In the July, 1910, number of THE NATIONAL BUILDER, page 46, you gave an answer to question No. 317, in regard to cubic foot estimating. Am I to understand that in that way of estimating all material is finished, even to cellar walls and the painting of the structure; if so, how many coats of paint. The answer also states that "These figures are from basement floor to ridge." That I take to include cellar and all the foundation. Am I right?

NOTES ON CONSTRUCTION

By WARFIELD WEBB

There are a large number of fires directly due to poor construction, and not, as some are inclined to believe, inadequate fire-proofing building materials. Taken as a general class, burned clay commodities are fireproof materials. The value of these materials naturally vary to a greater or lesser degree, but when we take them as a class, they are far superior to any other class of structural materials.

On the other hand the inferior quality of a building material will often do much to increase its inability to withstand any considerable amount of heat, and will make the structure, of which it is a part, more dangerous on this account. For this single reason, among many others, the manufacturers should endeavor to make their commodities superior in so far as actual quality is concerned. Even an ordinary clay brick is a good fire resister, when it has been properly manufactured. It can withstand a considerable fire

without being materially affected, the only requirement being that it be made with care and burned in like manner.
